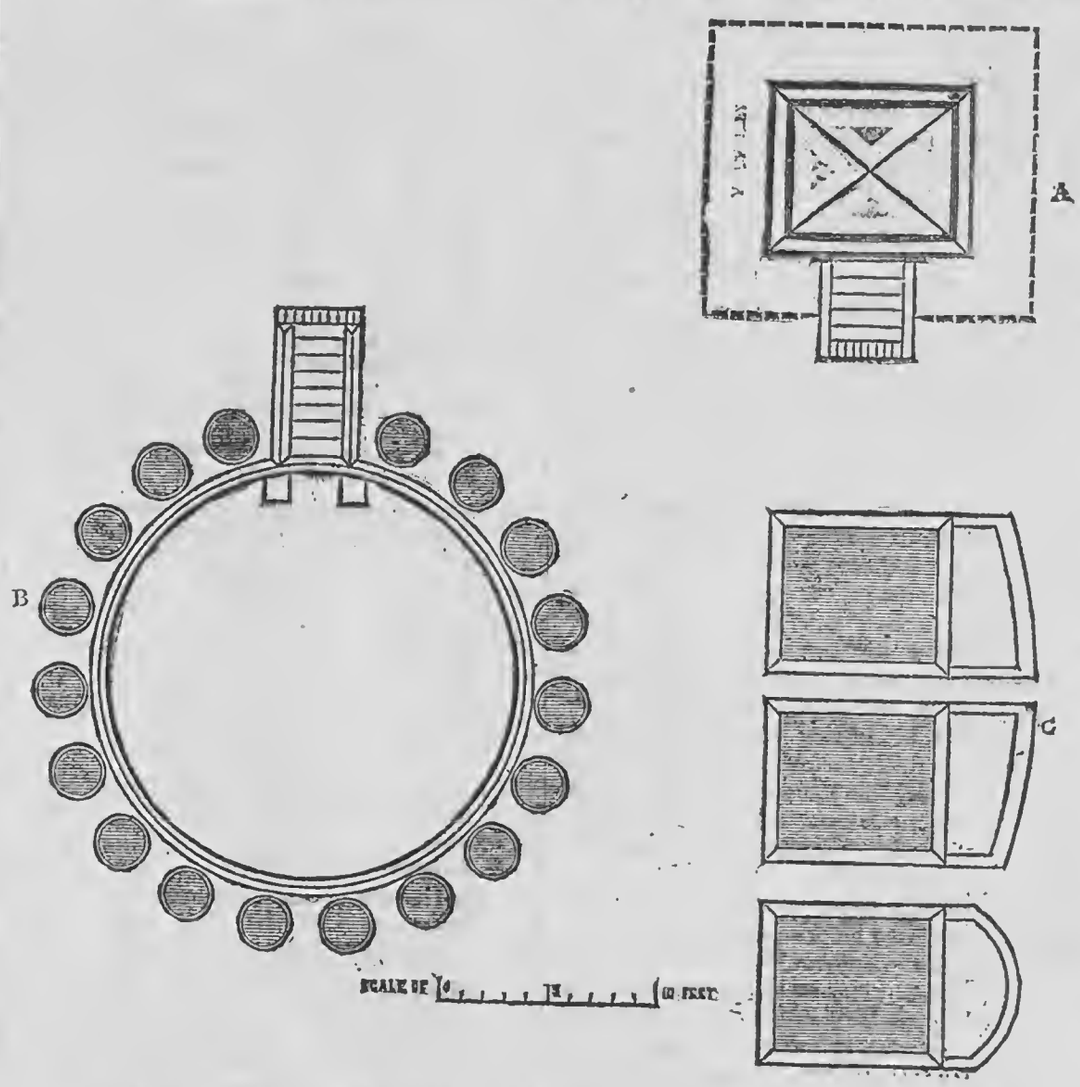
the piece of land near by. This piece of land appeared to be entirely above the valley first mentioned, and a casual observer would say at once that the natural place for an outlet was in the valley. Thinking the same myself, I proceeded to lay out the drains so as to utilize the outlet already built. Judge of my surprise when after passing the ridge which separated the valley from the piece of land, I found my level notes indicated that I was descending instead of ascending. I thought there must be some mistake, and took the levels a second time, with the same result, however. The result was that a new outlet had to be built to drain this piece of land, and we were forced to run the drains in a direction nearly opposite that which we first intended. Had no level been run over this piece of land, I have no doubt that those drains would have been laid with the outlet higher than the other end. As it was, I experienced a terrible criticism by an experienced drain builder for not draining the lower piece of land through the upper outlet in the valley. He said, "any one could see that there was the proper place for the outlet;" yet the fact of the matter was, that the only thing that could induce water to flow through it would have been a powerful pump. You will doubtless think that a piece of land so deceptive, must have been nearly level, but such was not the case, for the distance between the valley spoken of and the land to be drained did not exceed ten rods, yet the bottom of the valley was five and a half feet higher. The reason for the deception was in this case very simple; the sloping land was mistaken for level land, and with that idea in the mind the valley appeared the lower. Indeed, I asked a friend how much he supposed that piece of land, the length of which was about thirty rods, would vary from the level. He said he should think it nearly perfectly level, yet in reality, in going that thirty rods, there was a fall of nearly ten feet.

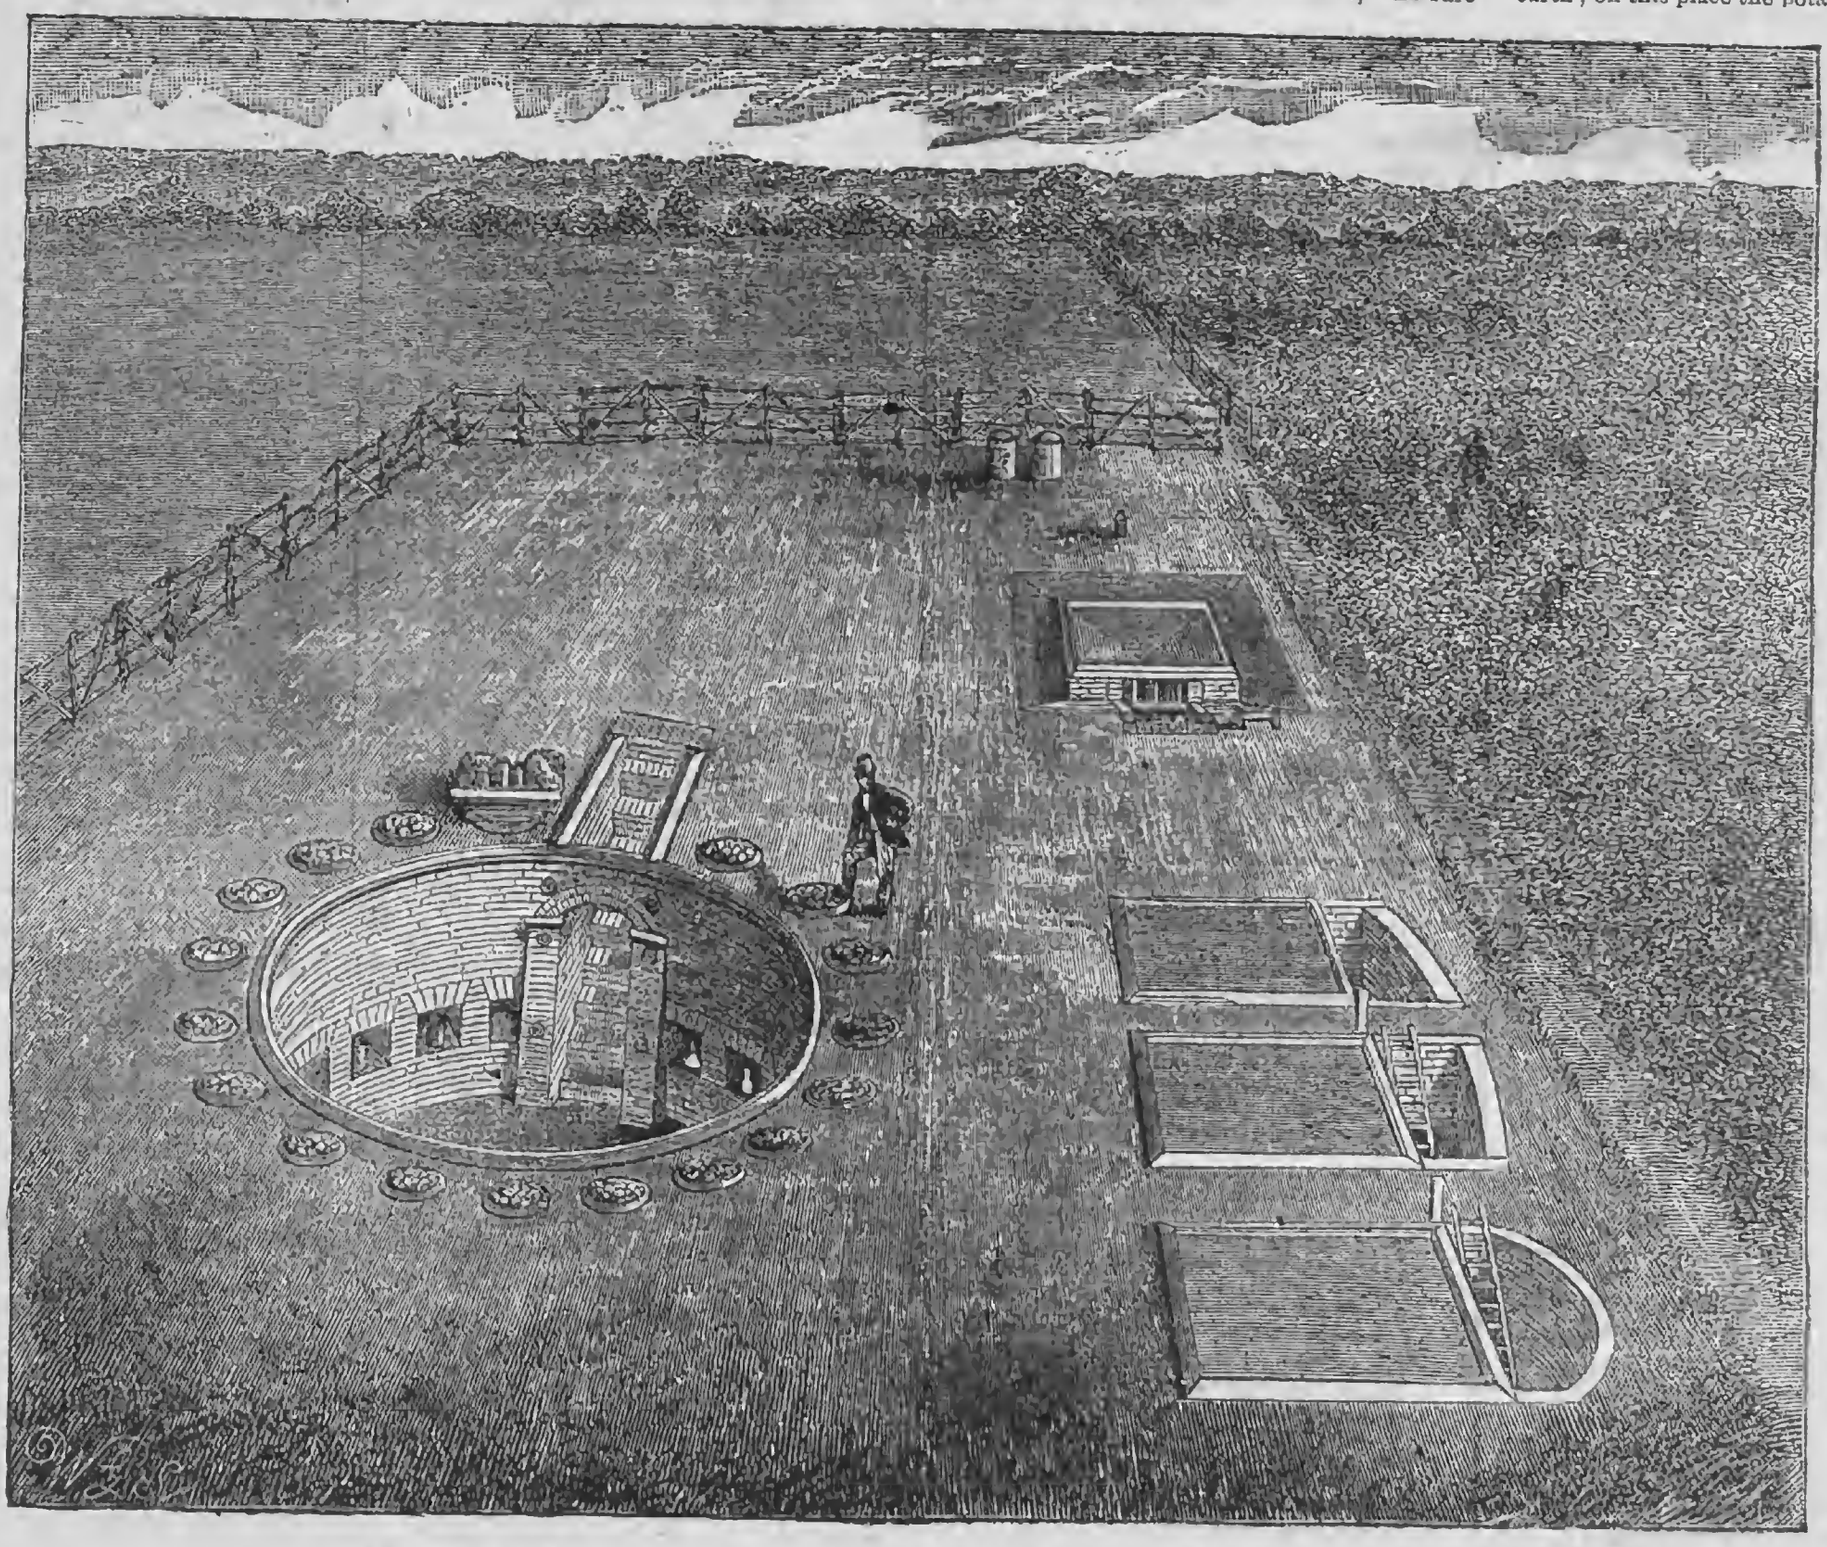
This case just cited shows how little dependence can be placed on the eye. Even men with much experience often find themselves sadly mistaken, and if they are men who profit by such experience they learn to be very cautious regarding the judgments of the eye, and ever distrustful of appearances.

If you can have running water through the ditch when laying the tile, you probably will be able to keep your ditch constantly rising in the same direction, but even then it is next to an impossibility to keep the ascent uniform, and there is danger of using all the fall before constructing the whole ditch. If you have no running water as a guide—and you very seldom will—the probability of having vertical bends and dips in your drain, forming effectual dams, is very great indeed, unless you adopt the method of building a guide for your bottom above your ditch as already described. The tendency is so great to follow undulations in the surface, without knowing it, however, that even the most experienced ditchers often make such blunders.



A, DRAIN-GAUGE. B, SMALLER DRAIN-GAUGES. C, LARGER DRAIN-GAUGE.

The method of construction used at the College, was devised and perfected by Dr. Miles, formerly Professor of Agriculture: the method is simple, and employs no instruments but what may be constructed by any man of ordinary ingennity. You may urge against the use of these instruments, viz.: level, shears, boning-rod and string, that it is a puttering job to set them up, and takes time that could better be employed in the actual work of constructing the ditch. That may be true, but the Yankee way of guessing also takes time, for the Yankee only guesses after he has examined all sides. Now which is cheaper, I leave it to you to decide, to spend one-half hour during the day in making preparations which will certainly lead to success in the construction of your ditch, or to be continually working in uncertainty; squinting up the ditch, going up and squinting back, and finally arriving at the undignified conclusion of a guess, which probably in one case out of five, at least, is erroneous, and the labor spent in that case is entirely thrown away. The cost of one blunder would pay the expense of many sewers. The motto of the under-drainer should be, "Be sure you are right, then push ahead," which, if properly lived up to, will do away with all the complaints of inefficient drainage.



DIFFERENTIAL DRAIN-GAGES AT ROTHAMSTED.

COOKING FOOD FOR STOCK.

It is claimed that by steaming or cooking food for Stock it is more nourishing, and that a less quantity is required to produce the same results as that not cooked. This is undoubtedly true, but the expense counteracts in a great measure the economy, and the cost of the apparatus to do it precludes its use unless there is a large amount of stock to be fed. The same purpose can be effected if the grain is malted the same as barley is in the making of beer. If hay be moistened with water and left in a pile till it heats and commences to ferment, it will answer the same purpose as cooking it. This converts a portion of the indigestible substances into digestible ones, which is what cooking the food does. This is more easily done than cooking the food and saves the costly apparatus. A large box to hold the hay that it may be somewhat compressed, is all that is required, and if grain and pulped roots are mixed with it and all fermented together, the whole makes a food superior to that fed raw, while the mixture is better than any of the ingredients alone. There is but little saved on labor, but the savings on fuel and cost of apparatus are items to be considered, and, moreover, malted grain is better than ground grain to feed.

Plymouth Co., Mass. ANDREW H. WARD.

Field Crops.

SWEET POTATO CULTURE.

M. B. PRINCE.

THE most common manner of growing sweet potatoes at the South—and with the exception that a hot-bed is required, the same mode of operation will do for any locality where they can be successfully cultivated—is to choose a warm locality, protected on the north and fully exposed to the sun, such as the south side of a building or fence. Mark off about twenty square feet of surface for each bushel of seed to be planted; remove three or four inches of the surface soil, placing it in a pile; then dig the pit some three inches deeper; place about two inches of fine fresh horse manure in the bottom, and on this two inches of good earth; then add another two inches of manure, filling up to an inch above the surrounding surface, with rich earth; on this place the potatoes thickly, though not touching each other. Use seed of medium size without splitting (as often recommended), better small than large, as they produce plants equally good in every respect and many more in number from a bushel. Press the potatoes firmly in the soil; cover with a mixture of sandy soil and manure, three inches deep; pat the surface down smoothly.

From this time on, until the plants are large enough to begin drawing—which will be in six weeks, more or less, according as the weather is warm or cold—they require bnt little attention, merely keeping the bed properly moist. I think sometimes it is well to remove one-half the covering if the manure produces some bottom heat and the weather is warm. A good soaking with soap-suds, once a week, is advantageous to the growth of the young sprouts. Heavy losses are often sustained from too early planting. Being a native of a warm climate, the sweet potato will not grow with vigor until the weather has become settled and warm. The first of April is early enough for the main crop anywhere north of the 36th parallel of latitude and, as we go north, the time should be correspondingly later.

When drawing the plants, get a firm hold as low down as possible with one hand, pressing on the tuber with the other; draw gently so that the tuber may not be disturbed in its bed. A light sandy soil is best for the sweet potato, and having been previously well plowed, we now properly commence the preparation of the land by making a liberal broadcast application of stable manure; run the furrows four feet apart, and, if we have them to spare, a sprinkling of ashes cannot be more profitably used than in the sweet potato rows. Throw up a sharp bed over this, and right here is where we come to a disagreement among our most successful growers; but, as fine crops are the result of both practices, I will describe both. The difference hinges only on the question, "Which is the cheaper?" This each reader can decide for himself.

The first and more common practice of the two is to set the plants eighteen inches in the row on these ridges, merely patting down with the hoe the point where the plant is to be set, thus "firming" the soil. The after cultivation consists in keeping the land clear of weeds and the soil loose by plow and hoe.

The other plan is to hill up a little further apart in the row and the rows a little nearer, setting in the same manner as in the former practice, and performing the necessary after-cultivation entirely with the hoe. As is often the case, we have the land prepared one or two weeks before we have a season of wet weather, which is important to success in planting, though no plant with which I am acquainted takes to its new home more readily than the sweet potato. Then we find it an advantage to hill up, thus more thoroughly preparing the soil and destroying the young weeds. Everybody says,—and "what everybody says must be true"—that the vines should be lifted once in ten days to prevent their taking root, but I have yet to discover the man who practices it. A finer crop than we harvested in 1877 I never saw, and not a vine was lifted until the roots were dug.

In harvesting the crop, we wait for a clear, warm day, when the soil is dry, unless cold weather threatens; or, if the vines have been scorched by frost, the digging must not long be delayed. We run the plow along each side of the row, turning the earth away, dig with the hoe, leaving them scattered on the ground to dry off, gathering up, however, before night those dug during the day. Assort while picking up into three lots: the large, fair, uninjured, for market or storing away; the small, smooth and regularly-formed, to be preserved for seed; and lastly, the culls to be used immediately either for the table or fed to stock, for which they are excellent food, horses, cattle and hogs being very fond of them.

Great care should be exercised in the handling, to prevent them from being bruised or cut, though the former is much more influential in producing decay. As to preservation, there seems to be no sure way, though a dry cellar or house where artificial heat can be introduced when the temperature goes below about 50°, is considered the safest kind of storage, not forgetting that perfect ventilation is all-important.

Warren Co., July 8, 1878.

RAISING FLAX.

The farmers of this country once knew the advantage of growing and working up flax for sheeting and table linen, and for tow trousers for summer wear. But this era of home manufacture has passed away, and hardly any attention is now given in this country to growing flax, or to working it up into linen goods. Cotton has taken the place of linen largely, and whatever else is used is purchased from European manufacturers, with the exception of yarn, thread and twine, and some crash. These are made in the United States, and in so doing the manufacturers use about 6,000 tons of raw flax annually.

The larger proportion of this flax is imported, because our farmers pay too little attention to the care of what flax they do raise, and do not raise enough of any kind to supply the demand, with the exception of tow for bagging and upholstering. The flax raised in the United States is all primarily for seed. In the West one peck of seed is sown to the acre, the flax mown, instead of being pulled, and most of the straw burned. A small part of it is thrown out upon the ground, and rotted and passed through a brake, and then taken to the bagging mills and the upholsterers. In this condition it is worth $40 to $50 per ton. In a few instances more care is taken in rotting and braking and clearing the flax of shives, and the coarse fiber is used to mix with finer fiber in making coarse twines, crash, etc., and is worth $80 to $100 per ton.

In New York State about one bushel of seed is sown to the acre, and the flax is generally left to get dead-ripe, and then pulled and after removing the seed, the flax is spread upon the grass to be dew-rotted, and then it is broken and scutched, and the fiber sent to the thread and crash mills, bring at this time 9@10c. per pound. There it is worked into the coarser yarns, twines and crash, and mixed with the finer imported fibers in cheapening the cost of manufacture.

There is no question bnt that flax-raising may be a profitable business for the farmer in the United States, and a little more attention to raising and preparing the fiber will give him double the present price. Importers now pay 20@25c. per pound for undressed Russian and Belgian flax, but the process of raising and preparing differs from that in the United States as follows: The seed is sown at the rate of 2½ to 3 bushels per acre, as early as the ground can be made ready, as the flax is a hardy plant, and is grown best in the moist, early spring months. Moist ground is also best for the crop. The flax is not allowed to become dead-ripe before being pulled, but as soon as the lower half of the stalk turns the flax is pulled, and the seed allowed to ripen in the bundle or shock. This gives a better fiber, and it is also thought a better seed, containing more and better oil.

After the seed is removed the flax may be kept any length of time before rotting, as in every process the fiber improves with age, or it may be rotted at once. The best time to rot is early in the spring or in the fall, as the hot, dry weather of summer causes it to become harsh and of a foxy color. The foreign process of rotting is to steep in a stagnant pond of water, for a few days, something being laid upon the flax to keep it under water, until fermentation takes place, and it is then spread upon the grass to complete; but great care is taken not to allow it to remain in the water or upon the ground too long.

When rotted, the flax may be broken and scutched at any time convenient, for, as said before, flax gains in value, as wine does, by age. This process pursued in this country, will give a fiber worth from $400 to $500 per ton. The steeping cannot be done in a stagnant pool of water in mid-summer in the United States, as the heat is too intense and fermentation too rapid. If in the shade or in vats in a barn cellar, it may be successfully done. If any of our readers have had experience in flax cultivation which is of different results, we shall be pleased to hear from them.

Arboricultural.

THE MUSIC OF THE TREES.

SAMUEL B. PARSONS.

There's music in the wild wind's roar,
And in the thunder's crash:
And in the waves that dash,
With crested beauty, on the brow
Of rocks all hoar and mossed,
Singing their melancholy dirge
For the ever loved and lost.

There's music in the flapping sail,
And in the creaking mast,
And round the prow whose graceful breast
The waters cleaveth fast.
There's music in the measured stroke,
Where voice and oars keep time,
And on the evening ripples clear,
Swelleth the village chime.

There's music in the organ's notes,
And voices gathered there,
In lofty nave, and arched dome,
For worship and for prayer;
And music, like the still small voice,
Breaks on the listening ear,
Where, reverent, my brethren wait
The Lord's own words to hear.

There's music in the merry tone
Of childhood's happy shout,
And in the gentle, loving kiss,
In which his heart goes out;
And yet, far sweeter still its tones,
When low, on bended knee,
It gives a simple faith and love,
And prays His child to be.

There's music in a woman's voice
Full gushing out in song,
Or in the fond, caressing tones
Which to her love belong;
When dimpled cheek, and rosy lip
The keys of music hold,
And all the heart's sweet melodies
Spring up in wealth untold.

The world is filled with music
To ears attuned aright,
And a soul in perfect harmony,
Is a soul all full of light;
But of true earthborn music,
That's thrown upon the breeze,
Few have such gentle beauty
As the music of the trees.

They all have different voices,
And were their language known,
A beauty all undreamed would swell
In every varied tone;
Their harps are swept by viewless wings,
Alike at eve or morn,
As to the tranced and listening ear,
Their melodies are borne.

From boyhood's happy hour,
To manhood's world of care,
Thro' joy, or calm, or suffering,
Their music met my ear.
The Maple sang in gladness,
While the Aspen danced in glee:
But the music of the mournful Pine
Was ever sweet to me.

When first I knew its swelling notes,
'Twas as a blithesome boy—
I loved to climb its sturdy trunk,
And in its arms to lie:
Full many a castle there I built
(They all are tumbled now).
And pleasant was the music then,
It breathed across my brow.

I made my Pine an errant knight,
Or troubadour of old:
And the Maple was his lady-love—
Dearer than gems or gold.
He brushed his leaves and spoke to her
Across my waving hair,
And her gentle voice would rustle back
Sweet answer to his prayer.

But manhood came, and 'mid its cares,
Sweet voices gladness brought;
My children in the old Pine played,
Its topmost branches sought,
Or, 'neath its sturdy, spreading arms,
They shouted in their glee,
While the Pine would roll its echo back,
Like the distant moaning sea.

Its voice was full of gladness then,
Its tone is mournful now;
The Fire King swept across its form,
And scathed its lofty brow;
The group that sought its welcome shade,
Is now a broken ring—
No hope of other life it has,
To meet their welcoming.

And ever still, in saddened tones,
It whispers in my ear,
"Tho' I am scared, my heart is sound,
And upward my career;
Be thou the same—for unto thee
A better lot is given:
My life is but for earth alone,
But thou canst enter Heaven."

Thus music is in every tree,
And each leaf has a tone,
And on the ear that listens,
Its melody is thrown.
So whate'er may be the music
That is flung upon the breeze,
There are few that have the sweetness
Like the music of the trees.

Horticultural.

KISSENA NOTES.

THE ROSE ACACIA.

Many plants that have been long familiar, and perhaps on that account less prized, renew their charms when presented under some novel or better form. Such a plant is the Rose Acacia—Robinia hispida,—under its usual low form very attractive, but straggling even to unsightliness. The flowers must be always beautiful and the foliage graceful and delicate, but, grown low, the bloom is often obscured and the leaves trailed in the dirt. But let it be once raised up by grafting on a high stem of Yellow Locust,—Robinia pseudacacia,—and it becomes graceful and weeping. Both flowers and leaves suggest tropical vegetation. Indeed, the rosy color and curious form of the flowers and the elegant appearance of the leaves attract the eye more readily than choicer and rarer plants. Even in this form, however, the Rose Acacia is not perfectly satisfactory, for the stems of the Robinias are very apt to be disfigured sadly by the borer, for which no efficient remedy seems to exist. Meantime, many years may pass before the borer fairly gains sway, so that abundant time for enjoyment will remain to repay the trouble of setting out the tree. Once unsightly, the ax will readily remove it.

SUMMER-FLOWERING SHRUBS.

The St John's-worts or Hypericums form a group of flowering deciduous shrubs most valuable in more than one way. Midsummer affords few flowers to relieve the general green of the landscape, often dimmed at that season by drought and dust. Bright and free-blooming shrubs have consequently special charms at this season. The St. John's-worts form such a group. Their leaves are fine, oftentimes glossy, as in Kalmianum, and the bright yellow flowers, distinguished by a crown of numerous anthers, frequently cover the entire plant. Their proper position is on the outskirts of a group, where they afford abundant bloom throughout the hottest part of summer. There is a number of varieties, one at least of which has flowers three inches in diameter, like some great yellow Clematis: although many of them are well-known, they are not used to any great extent, certainly not to anything like the extent they deserve.

BERRIES FOR ORNAMENT.

Among the beauties of midsummer and early autumn, are the richly-hued berries borne by many deciduous shrubs. They often succeed attractive flowers, but are themselves scarcely less attractive. Just now the deep-crimson, waxy berries of the Tartarian Honeysuckle, and the glowing fruit of the Viburnum lantana, are specially notable. The latter is a shrub not sufficiently appreciated. It is choice and not easily propagated, and the fine and peculiar coloring of the foliage, among other shrubs, is very effective. The berries of this Viburnum hang in clusters, while those of the Tartarian Honeysuckle cling singly here and there to the stem.

TWO HYDRANGEAS.

In dwelling on the splendid attractions of the Hydrangea paniculata grandiflora, properly almost a fall-flowering shrub, we are apt to forget that there are other Hydrangeas possessing very charming qualities. For the present season of midsummer, Hydrangea nivea and H. carnescens are very valuable. If their flowers are less showy than those of H. paniculata grandiflora, they are earlier, large and of fine tint and of curious formation. The shades of white or flesh-color that distinguish either variety are indicated by the names *nivea* and *carnescens*. They present, however, special attractions in their foliage over that of paniculata grandiflora, on account of the white color of the under-side of their leaves, as shown when tossed up by the breeze. A varied group of Hydrangeas forms an effective feature on the lawn.

A LATE-FLOWERING WIEGELA.

Wiegela Lavallee is again proving itself a most noteworthy member of the species. After all other Wiegelas have long done blooming, it puts forth a second and most vigorous set of its chocolate flowers, a fact that quite distinguishes it from others of the species. The foliage is equal in vigor and health to any Wiegela, while its flowers are unsurpassed for peculiar beauty. It remains, however, rare, and like most choice shrubs grows in popularity slowly.

Samuel Parsons.

NOTES FROM THE RURAL GROUNDS.

THE BEST THING TO BE DONE UNDER THE CIRCUMSTANCES.

Wise parents would not condemn their children to devote hours daily to the study of music unless they possessed natural musical talents. It is doubtful if, by the most earnest study, they could ever attain to excellence. It would be unwise to oblige a young student to give most of his time to the study of mathematics, with the view of educating him to be a civil engineer, if he had no natural aptness for the study. At the most he could only hope to attain to mediocrity, a result that would not pay for the cost of its attainment. Better afford the facilities to young students to excel in that which comes easy to them—in that which their minds readily comprehend, and for which they have an intuitive liking, even though the profession chosen is less flattering to the high aspirations of the parents or the "dignity" of the family. Success in any respectable occupation is better than failure in any occupation that may be deemed to rank higher.

We wish to apply this reasoning to the farm, garden and orchard. In the district from which we write, the cultivation of Fall and Winter Apples is impracticable, as we view it. Yet hundreds of acres of land are covered by apple trees. They are vigorous. The soil and climate are all that need be asked. The trees blossom, set their fruit. It grows apace, is attacked by the Codling Moth and destroyed. The entire harvest of late apples would not pay for a tenth of the interest of the value on crops which might be grown in their places. Pomologists tell us—"fight them!" "You need not look for grand crops without labor." "Crops raised without labor are worthless." "If you are not willing to take care of your fruit, you do not deserve to have any." This is all true within certain limits. So qualified, it is the doctrine we advocate. But as there is a point beyond which forbearance ceases to be a virtue, so there is a point beyond which the cost of production is greater than the value of that which is produced. And this is precisely the point we have reached in this and many other sections of our country with Fall and Winter Apples. If the entire country were alike subjected to the same destructive agency, then all would be placed upon equal ground and all would share alike the cost of fighting that agency. As it is, however, we stand pretty much the same chance of raising paying crops of apples that the youth having no aptitude for mathematics has of becoming a distinguished engineer, or of him having no "ear for music" of becoming a noted musician. The best thing we of the cost-more-to-raise-than-the-crop-comes-to sections of country can do is to destroy our apple orchards and cultivate in their stead pears, grapes, garden or farm crops that *can* be raised without a suicidal expenditure of labor, time and means, leaving to the other sections of country a monopoly in those crops to which all the conditions are specially favorable.

THE HORSECHESTNUT SHRUB.

This was introduced many years ago and is just the shrub we should select for a farmer's front garden. Before us, as we make these notes, is a specimen about four feet high and not less than fifteen feet in circumference. There are forty-nine racemes, varying from six inches to eighteen inches in length, bearing slender white flowers with stamens twice as long and pale-red anthers. It may easily be imagined that now, while few other hardy shrubs are blooming, it is a very pretty and showy object. Those who think of this in association with other horsechestnuts will picture an erroneous idea of its habit. It has no inclination to be confined to

a single stem, but sends up many slender radicled shoots which spread out and then ascend, giving at length a hemispherical form to the plant, the leaves of which well conceal the branches beneath. It should stand alone or else be placed in the foreground of evergreen groups to relieve them during the summer. One reason why this plant is seldom seen in ornamental grounds is, that when very young, there is little about it to engage the eye. It is a young horse-chestnut—that is all. But when placed in rich soil, and given plenty of room, it develops in the course of four or five years peculiar beauties, which secure it a full share of attention. Its botanical name is Æsculus macrostachya—by some A. parviflora and Pavia macrostachya. It is propagated by layers and seed, though in this climate it does not fruit abundantly. We have three plants, and have never been able to gather over half-a-dozen seeds.

EXPERIMENT WITH GREEN PEAS.

Soil rather clayey and moist. Twelve seeds planted in each case. Variety, Tom Thumb. All planted June 21.

Two inches deep came up June 27. Nine germinated. Are now (July 16) in bloom and five inches high.

Four inches deep came up June 28. Twelve germinated. Are now in bloom and four inches high.

Six inches deep came up July 4. Three germinated—two died. Two inches high—not in bloom.

Eight inches deep came up July 6. One germinated and died.

Ten inches deep—none came up.

Miscellaneous

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

"It beats everything" how hard it is to get a girl to help do housework. After riding three days we hired the first woman to be had, and her husband too, to get her. In three towns there are not more than fifteen girls, all told, who "go out" to do housework. Of course there is a great demand for this meager number. The wages are from a dollar and a half, to two dollars and a half per week, but this is no temptation. A false pride is at the bottom of this whole question of labor. A girl will marry and be a drudge all of her life, but she will not work for wages, however comfortable her home may be. What shall be done?

An old agricultural paper of fifty years ago says soaking the turnip seed in fish oil will keep the flies from destroying the plants when they come up.

We are going to sow turnip seed in the cornfield to make feed for the store hogs and the cows after the corn is drawn out of the lot. What is left will make manure. The turnips will not hurt the corn any, as they will make the most of their growth after the corn is ripe. We sow the common flat turnip. The ruta-baga seed are all up and growing well; as they were soaked a week in water before planting, they came right up and this we think to be clear gain. It will not do to plant seed after being soaked so long unless they are covered deep. We put these down an inch. Two big loads of clover were cut from the patch before it was plowed. These plants are ahead of the weeds, which is one other advantage of soaking the seed. We roll the seed in plaster, but dirt will do to dry them so that they can be separated.

Esquire Davidson uses a pair of shears to cut the pea pods, and this saves the vines from being pulled. The least pull will start the roots and cause the vines to dry up.

Orchard-grass will do well on hard land. This is in answer to a correspondent. As the seed makes a tiny or delicate start the land should be made fine and mellow on the surface. It is best to brush the seed in or to cover with a smoothing harrow or one with the teeth wide apart. It takes two years for orchard-grass to get fully rooted, and after that it will grow rank and protect itself.

Melons will grow much faster if stones are placed around the hills. The stones retain the heat at night and also increase it by day, and this helps to push the melons on. This advice is not of much consequence where the climate and soil are natural to them, but in our more northern latitude and on our hard, stiff soils it is a valuable hint, as there will be a scant supply of melons unless a high degree of heat is kept up.

Mr. Nathan Smith keeps his pigs in a yard and cuts clover for them. He calls it "soiling his pigs." As soon as the patch is cut over, it is ready with another crop beginning at the oldest part. His pigs look fine. They eat the clover greedily and are fed all they want, three times a day. It is certainly an economical plan, and a little ground is made to go a great ways. More manure is made and perhaps this will pay for the extra trouble in feeding. The great want of all farmers is manure, and as Mr. Crozier says, "it is the mother of everything."

We are adhering this year strictly to the rule not to allow but one service for any stock animal. A close observation for years has satisfied us that it is the surest, and at the same time altogether best for the male.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

New Haven, July 13, 1878.

Bulletin No. 18. Fertilizer Analyses.

166. Muck. Sent June 11, by J. Hamilton Lee, Secretary Killingworth Farmers' Club.

167. Bone Meal. Manufactured by Rafferty & Williams, N. Y. "Consigned to Rodney Kellogg, Hartford. Not offered for sale." Sampled May 2d, by J. J. Webb, New Haven.

172. Nova Scotia Plaster. Manufactnrod by G. W. Miller, Middlefield.

173, E. F. Coe's Ammoniated Superphosphate.

174. Abattoir Guano. E. F. Coe, Long Island.

172, 173 & 174 were sent June 26, by P. M. Augur, Secretary Middlefield Farmers' Club.

D—Guaranteed Strictly Pure Paris-Green. From stock of J. O. May, Naugatuck. Sampled and sent June 10, by J. B. Talles, President Naugatuck Farmers' Club. Price 50 cents per pound.

	167	172	173	174
Nitrogen	1.55		2.16	2.49

Water	$73.54
Organic Matter (Containing Nitrogen .06 per cent.)	21.12
*Ash	5.34
	$100.00

*Of this 4.19 per cent. is insoluble in acid.

D—Contains 55.19 per cent. arsenic (arsenious acid) and 24.97 per cent. copper. It is accordingly very pure Paris-Green.

S. W. Johnson, Director.

Industrial Implements.

THE McSHERRY DRILL.

This drill, like many others, has the various attachments for sowing grass and fertilizers, being thoroughly equipped in such respects. Its cups, for any grain to shake out or escape in any other way than by the action of these wheels, the result is a regular, continuous flow of seed, making skips an undreaded interruption. They do not break the grain, because the spiral wheels are provided with a Patent Washer at the end of each, revolving with the wheel and preventing the grain from being caught and crushed. These wheels and washers are very durable.

The quantity to be sown per acre is regulated by cog wheels, and is governed by established rules. It can be regulated to sow any desired quantity per acre, and can be changed in a moment by taking off one wheel and slipping on another. The feed sows equally on all kinds of land, and exhausts the grain from the hopper uniformly.

The hoes may be changed from zigzag to straight rows by merely withdrawing bolts and removing the bar so as to bring the hoes into single or double rank; re-inserting the bolts holds the hoes rigid in their new positions. This is said to be a very strong and satisfactory hoe-shifting device, but, where preferred, a lever hoe-shifter is furnished at a small extra cost.

The patent lift-bar for raising hoes is strong, light and neat. By raising it hoes are withdrawn from the ground and the grain-flow cut off, the grass-seeder stopped, and the land-measure prevented from marking measurements. The drill is always in gear when the hoes are lowered into the ground, and out of gear when the hoes are raised. It is thrown in or out of gear by raising or lowering the hoes.

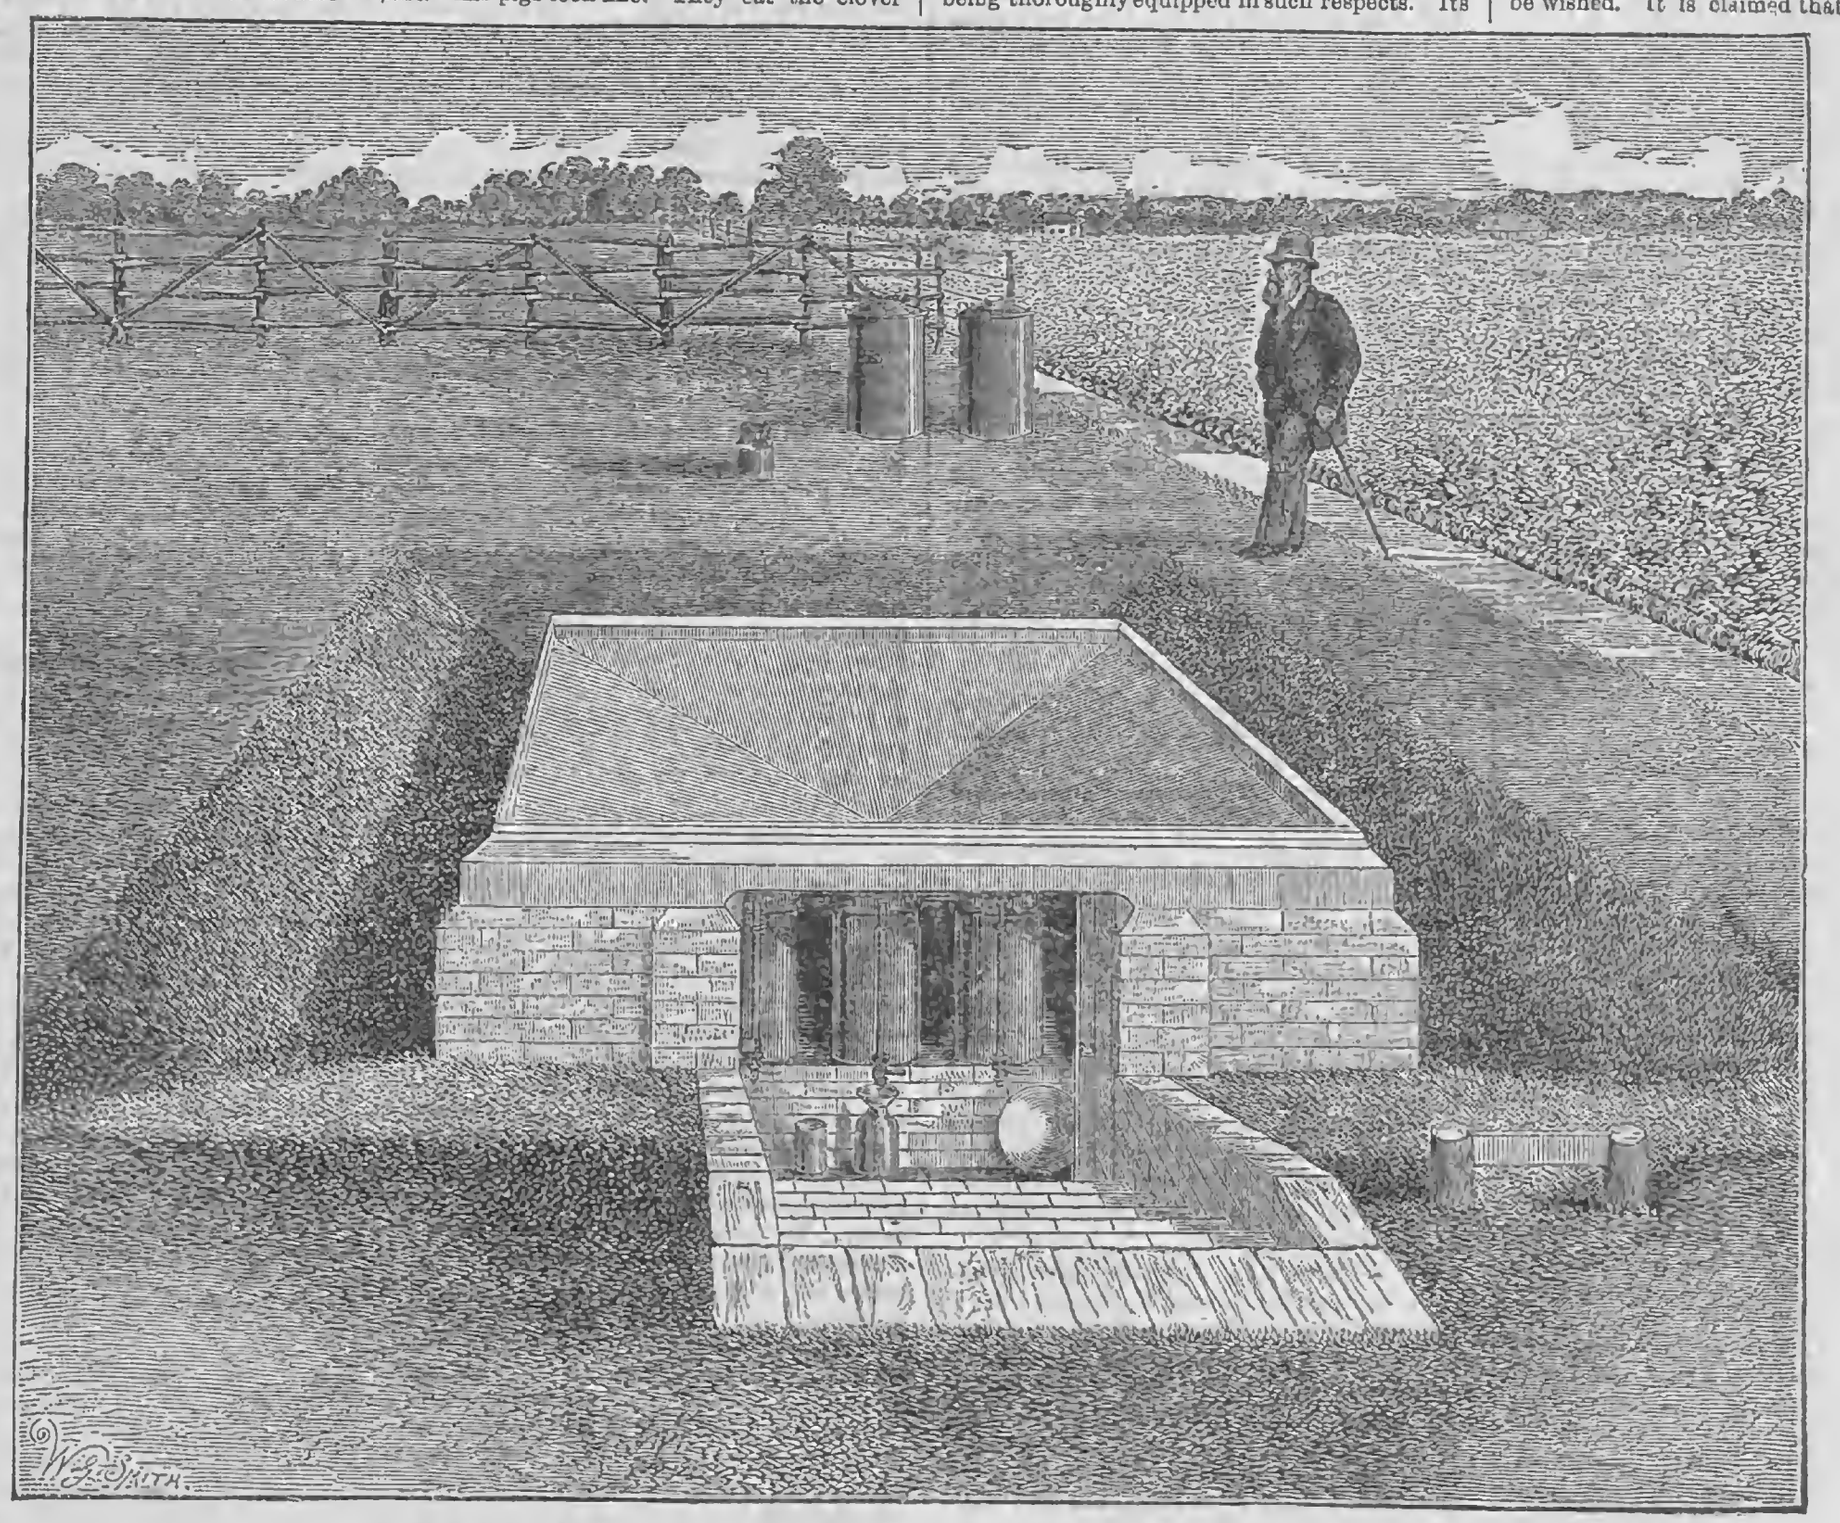
The size, shape and arrangement of the cups, illustrated by cuts, and circulars fully descriptive of the drill, may be had by applying to D. E. McSherry & Co., Dayton, Ohio.

CORNISH & CURTIS'S BUTTER-WORKER.

The Butter-worker sent us for trial by Cornish & Curtis, Fort Atkinson, Wis., has been steadily in use with good results. It is very simple in construction, being a triangular table with raised sides, resting on a tripod. The table inclines gently away from the operator, who stands at the base of the triangle. The worker, a hexagonal wooden bar, is fastened at one end, and works laterally, or perpendicularly as may be wished. It is claimed that cheapness, durability and effectiveness are secured by using th worker.

We can attest to the justness of the claims. It does good work, and is durable. Its price, $3.50, is not exorbitant.

The Wood-Binder is doing excellent work. A recent trial on a large grain-field in New Jersey where the grain stood up well, the Binder did the work of five men, tying the bundles and throwing them at least six feet clear of the harvester,



ROTHAMSTED EXPERIMENTAL FARM—(See page 470.)

The Querist.

ANSWERS TO CORRESPONDENTS.

The Grape-Vine Flea-Beetle.

E. S. Smith, Susquehanna Co., Pa., asks what is destroying his grape-vines, and incloses specimens of an insect that, from the first warm days of spring, eats into the buds, and then devours the leaves, if there are any. There is also a slug which is making its appearance on the leaves, in his opinion probably a descendant of the other. He is anxious to learn how to destroy them, for unless destroyed, they will not leave a grape another year.

ANS.—The specimens, which were excellently arranged for transportation, were the adult form of *Graptodera chalybea*, or the grape-vine flea-beetle. As mentioned by Mr. Smith, they appear early in spring. Soon after their appearance, they lay their eggs, as a second brood is found on the grape-vines towards the end of July, and other broods are found later. Probably the "slugs" which are making their appearance on the leaves are the descendants of the beetles, though no specimens were sent to be examined. The larva of this beetle is of a light-brown or chestnut color, with eight rows of black spots on the back, the spots of the two middle rows running together. When full-grown, the larva is about nine millimetres long. The head and feet are black. There are six true-jointed legs under the fore part of the body and there is one fleshy prop-leg at the other extremity, but the under side of the belly-rings is swollen, so that there seem to be prop-legs along the belly. When the larvæ have done feeding, as they have in about two weeks after hatching, they go into the ground to change into beetles. Grape-vines are much benefited by watering their roots with strong soap-suds, and there is no time when it is easier to kill the larvæ by pouring suds on them than just as they go under ground. While they are feeding on the leaves, they may be dusted with hellebore or with Paris-green; even lime dusted on the leaves is said to kill them. The beetles are hard to catch in ordinary ways, except by catching them with what the entomologists call a bag-net, that is, a bag on a hoop. This may be swept along close over the leaves of the vine, and then the beetles may be plunged into hot water.

Aphides on Grapes.

Mrs. Leverett P. Judd, Bethlehem, writes: In the RURAL for July 6th, I notice some one asks whether there is any remedy for the little brown Aphides upon young grapes, and so forth.

We have always used for all such things an old pan, partly filled with dry tobacco leaves: set the tobacco smoking, and hold the pan right under the parts affected. The smoke will kill all such troublesome pests, and will destroy the lice often found upon thrifty rose-bushes.

The Beautiful Wood-Nymp Moth.

Sylvester Leyman, Schoharie, N. Y., sends a miller new to him and wants to know all about it.

ANS.—The miller is known as the Beautiful Wood-nymph (Eudryas grata). Its caterpillar feeds on the leaves of wild and cultivated grape-vines, and on those of the Virginia-Creeper (Ampelopsis quinquefolia). Sometimes the caterpillars appear in such abundance on the latter plant, as it grows upon trellises on the walls of houses in ew York and other cities, as to strip the vines bare of leaves. Two other kinds of caterpillars, bearing so close a resemblance to this as to have made skilled entomologists find it difficult for a long time to distinguish them, occur also on the grape-vine and Virginia-Creeper. These are the caterpillars of the Eight-spotted Forest-moth (Alypia octomaculata) and of the Epimenis moth (Psychomorpha epimenis). Still a fourth kind of caterpillar resembles these three, but although the most nearly related to the Beautiful Wood-nymph, it feeds upon an entirely different plant—the Purple-veined Willow-herb pilobium coloratum). This last caterpillar produces the moth known as the Pearl Wood-nymph (Eudryas unio). Mr. J. A. Lintner, of Albany, upon whose writings we are relying in this statement, has pointed out the differences which serve to distingnish these four kinds of caterpillars, and these differences may be indicated sufficiently as follows:

All four of the caterpillars are humped on the eleventh segment behind the head, or the last segment but one of the body; but this hump is much more prominent on the caterpillar of ndryas grata than on the others, being, to use Mr. Lintner's words, "angulated at that point to a degree that were it a vertebrate it would suggest the idea of its terminal portion dragging, rom having been broken at that point." The body, otherwise, is nearly cylindrical, and tapers om the hump regularly toward the head, hich is round and rather more than half as ide as the widest portion of the body.

The body is transversely banded on each segment with white, black, and orange, except in ychomorpha epimenis, which lacks the orange bands. This caterpillar has on each segment our white and four black bands alternating. The other three caterpillars have six distinct black bands on each of the principal segments and the Alypia octomaculata has in addition a black edging on each side of the broad central orange band, so that it may be said to have eight black bands on each ring. It may be further distinguished from the two Eudryas caterpillars by having a row of white spots along the lower margin of the sides, and by having white hairs as long as the width of the body on each of the black spots on the back and sides. The two Eudryas caterpillars have quite short brown hairs on the black spots.

Thus the three of these caterpillars which are found on the grape-vine and the Virginia-Creeper, may be distinguished from each other, while the fourth is not so likely to be met with and not of so much interest to the horticulturist. However, the caterpillar of Eudryas unio has the black bands which cross it nearly twice as wide as the white ones, while the caterpillar of E. grata has these black bands only half as wide as the white ones, and, as mentioned above, it has the hump on the eleventh segment very prominent.

Figure of larva and imago of Ps. epimenis in Lintner's Entomological Contributions, No. 3, in the 26th Report on the State Museum or New York, p. 121. Do., of Alypia octomaculata l. c. p. 122. Do., of Eudryas grata l. c. 122, 123.

Making an Æolian Harp.

J. N. J., Mount Vernon, New York, asks: Can you give me instructions through your paper how to make an Æolian harp; particularly as to number of strings and manner of tuning?

I saw a home-made one on the 4th inst. that was not satisfactory to me, and I would like to make a better one. That had seven strings; too many *I* think. It was made entirely of pine. Would not spruce top be better?

ANSWER.—The harp commonly used is a box of *thin* wood, of suitable length,—the width of the window-sash, near which it is placed, being a good length. It should be about five inches wide and six inches deep. It adds to the effect to perforate the topmost board, over which the strings are suspended, in much the same way that the body of a violin or guitar is ventilated.

Fifteen strings of gut or wire should be employed, and fastened at one end of the box by pins. They are then passed up and over two glued strips of wood that serve to keep them from lying on the surface of the box, and fastened at the opposite side of the box by pegs, that perform the same functions as pegs in violins, etc. By turning to right or left the tension is increased or diminished until the desired unison is produced. The box is *open* on the sides presented to the room and to the exterior air, that is, the harp has only top, bottom and end pieces. The strings are sounded by the passage of air through this clear space.

Pine is not a satisfactory wood to employ in making an Æolian harp; something that is hard, not resinous, and will not easily be affected by moisture is the best material to be used. We should think ash a good wood for the purpose.

Another and simpler way to construct the harp is to stretch the strings over the open top of a box that has its three remaining sides closed. The effect is not as good, however. When placed in position, the window should be only partially open, that a strong current of air may be induced.

Miscellaneous.

W. Bernstein, Hennepin Co., Minnesota, asks for the best method of killing the wild Morning-glory in the field.

ANS.—The roots of this are creeping and perennial. There is no other practicable way to exterminate the plant but by a persistent disturbance of the roots by plowing.

A. R. C., Woonsocket, R. I., inquires as to the efficacy of prepared egg food, mentioning several preparations advertised for sale.

ANS.—Those that we have tried are no doubt good for poultry. They give, in a prepared state, food which poultry need, and which might not otherwise be given them. There is nothing in these preparations, however, that will produce eggs any more than good feeding, good care, and, once in a while, some cayenne pepper and ground bone. As a regular food it would be rather costly for farmers.

N. J. B., Little Rock, Arkansas, says: Please accept my thanks for the "Cricket." It is undoubtedly the neatest, handiest, and certainly the *cheapest* timepiece in existence. I cannot make out exactly what it cost me. I used to pay for the RURAL 10 cents per copy, that is, annually $5.20. Now I send you $3.50, leaving $1.70 in my pocket, and I receive the RURAL and "Cricket." Now, how much for the paper and how much for the clock, and to what account shall I credit the $1.70? Please solve this problem.

ANS.—The retail price of the RURAL should be but six cents.

Wm. T. Martin, Mifflin Co., Pa.—Is it beneficial to cantelope and melon vines to cut off the end? Why, and when? Should it be done with pumpkins, etc.? Please answer in the RURAL, and oblige yours.

ANS.—Cutting or pinching off the ends of such vines restricts the area of growth, inducing lateral shoots. If it is desired to raise large melons or pumpkins, stopping the vine by giving to the fruit more nutriment, will tend to accomplish it. The time for pinching is when they have made a considerable growth and the fruit has set.

L. W. S. What kind of a paper is the Burlington Hawkeye, and where is it printed?

ANS.—The Hawkeye is published at Burlington, Iowa, a daily and weekly edition is issued. It is in most respects similar to papers of its class, but has been brought into prominence by the humorous writings of one of its editors, Mr. BURDETTE. The paper is republican in politics.

CALIFORNIA PECULIARITIES.

W. C. L. DREW.

THROUGH the foot-hills, at this season of the year, the early morn is perfectly enchanting about sunrise. The healthy and invigorating atmosphere is filled with a dewy fragrance peculiarly Californian, making the happy spectator feel as buoyant as if freshly invigorated with a draught from the fountain of youth. On one hand, we behold the vineyards amid the rolling hills, covered with emerald leaves, and the grape in blossom; in the front is an apparently endless orchard, heavily laden trees completely shading the ground, while here and there we notice a giant cherry tree, crimson with ripe, luscious fruit, tempting us to invade the grounds. Looking to the other hand, many a hill covered with tall and waving rye, golden wheat, or newly-mown hay, presents a truly grand and imposing picture. Now is the time to enjoy scenes like this, while all nature is wearing her spring robes, while mankind is happy gathering in the abundance with which she has blessed him, and the ranks of KEARNEY (the San Francisco labor-reformer) are nearly deserted for the harvest field.

The equability, mildness, and dryness of our climate are peculiarly favorable to the sound action of the vital organs of the vegetable world. Vegetable growth is exceptionally vigorous here. Our fruit trees grow more rapidly than in the Eastern States, come to maturity earlier, and bear more abundantly and are free from insect depredations. The variety of our vegetation is greater, our vegetable markets are justly the pride of our people, differing from most of the great markets of the world—they are perpetual. And further, when frost and snow cover most of the Eastern States and cities, the greatest varieties of all kinds are produced here, and are most abundant in the city markets and peddlers' wagons. Winter and early spring are the most prolific seasons, in the summer and fall seasons vegetables are raised through irrigation, and consequently are much less abundant.

Even our flowers are far more prolific; we have not as many roses in June as they probably have in New York or Boston, but we have them all the year round. Further, ours form handsome trees with trunks from two to four inches in diameter, large spreading tops four to eight feet across and growing ten to twelve feet high; our Oleanders, instead of being puny pot-plants, grow in the open air the year round, forming handsome flowering trees twelve to twenty feet high, quite as large as an ordinary-sized apple tree. Our Verbenas and Pansies furnish flowers at Christmas as well as in June, without the aid of protection of glass or green-house. The palm tree and the persimmon, the orange and the apple, the vine and the pine-apple, the fir and the nopal (or prickly-pear), stand side by side to prove that the climate of California is favorable to the growth of plants indigenous to both the tropical and frosty regions.

California has already produced vast changes in the financial and commercial world. So rich has been her production of gold, that its value has been reduced heavily all over the civilized world. Its mines of cinnabar have affected the price of quicksilver to a like extent, and, for many years to come, our mines bid fair to hold their own. In our own vicinity, El Dorado County, the mines are, if anything, improving on what they have been during the last few years; in fact, so greatly has confidence in our mines been restored, that many which have been idle for five or six years were, this spring, started into new life again with new and improved machinery, thus bidding fair to restore California to her "good old days of yore."

El Dorado Co., Cal.

RURAL SPECIAL REPORTS.

ROCHESTER N. Y. July 18, 1878.

FOR the past five weeks we have had dry hot weather with but few showers—until last week when we had several light ones. Haying is nearly over; the crop generally having been good in quality and quantity. The market is overstocked, really fine timothy hay well cured having been sold as low as $8.50 per ton, although the average price is about $10 the ton. Good, clean timothy, of last year's crop, free from chaff, is offered at prices ranging from $10 to $14 per ton.

Wheat harvest has commenced, but few pieces being left standing. The acreage has been large, the straw generally good and in most cases the heads are long and well filled. Farmers are looking for a large number of bushels, but a low price, the general impression being that $1.00 the bushel will be the prevailing price, although some few will hold their crop for $1.10. Spring wheat is not grown much through this section, being considered an uncertain crop. There are some good pieces; but it is generally poor, owing, I think, to late planting, as every piece, so far as my observation goes, put in early, will turn well.

Oats, though a variable crop, are looking well. Barley is a small crop, but few acres planted and these promising poorly. Potatoes are coming on better than was at one time anticipated, still I do not think the crop will be large. Bugs are plentiful, but Paris-green kills them. Beans seem to have been neglected for wheat, particularly this is true of Orleans Co. and Niagara Co., as, in a recent trip through them, I noticed but few acres of this crop as compared with last season.

With a large crop of grain through the country, prices fairly remunerative, and confidence, in a measure, restored, this season should see the dawn of better times. H. T. J.

ALLEN CO., KANSAS, July 13, 1878.

On June 1st my corn was 4 feet 6 inches high; on June 15th, eight feet ten inches; on June 30th, eleven feet eight inches. How is that for high? I am going to cut it in another month, on the 15th, when I expect it will be about fifteen feet!

There is sure to be another rush out of Kansas and I will tell you why. First, we have only one market, namely, Kansas City. Everything has to go through there, and all the immigration is to the Western part of the State. They try to get as far as they can away from a poor market, if they can only get railroad land, and as far away as they can from timber brush also. They will get their eyes open after six months or a year, then they will face homewards. I can buy improved farms here, within one hundred miles of their poor market, all fenced and hedged-up, house, fruit and water, within one to four miles of good timber, for as low a figure as they pay for their railroad land. Fat steers are worth $3 to $3.50 here now; fat hogs are doing better; they sell now for $3, but have been down to $2. I for one go in for good land, coal, wood and water. In some places they have to go 25 to 50 miles for their wood. I spent about eight months looking over Kansas before I fetched up here, and if I stay in Kansas, here is the place for me. A. W. W.

BROOKLYN, N, Y., July 17.

I WAS much interested in the remarks of your correspondent Renoclaf, respecting Rhododendrons, as he saw them at Mr. Hunnewell's. Where a great variety and display are desired, and one has unlimited means, it may be desirable to have half-hardy varieties. But for ordinary collections it seems to me that the choicest of the Catawbiense varieties ought to suffice. With these, when once established, no especial care is needed afterwards. With the Ponticum varieties, there is no end of care, trouble, accident and disappointment. J. C.

PEQUONOC BRIDGE, Conn., July 17, 1878.

THE fore part of June was dry; since then fine showers have fallen at intervals of perhaps a week. Crops are exceptionally good; hay is heavy, and farmers have succeeded in getting it stored in good order. Despite beetles and slugs, new potatoes are plentiful and cheap. We have had some remarkably hot days this month. The fourth was said to be the hottest so far this season; I think times are getting better. I judge so by the smiling faces I meet on all sides.

M. W.

FULTON CO., Ga., July 10th, 1878.

WEATHER warm and dry, occasional showers, not sufficient for the demand. Cotton and Corn promising a full crop and a little surplus.

Fruit is in abundance. Peaches and Apples are now 50 cents per bushel. Irish potatoes very dull at 50 cents per bushel. Sweet potatoes just coming in at $1.50 per bushel. Wheat thrashed, and yield, averages 10 bushels to the acre—very good for this country. Times rapidly improving. CHAS. DECKNER.

PHELPS, N. Y., July 19th, 1878.

WE have had four days of intensely hot weather. Thermometer has ranged from 90° to 96° in the shade. No cases of prostration have as yet, however, come to my knowledge. Half of the wheat crop, which is very heavy, has been secured, and about all will be, in two days more.

Barley is cut, and a good crop. Apples plentiful; peaches will be a small crop. Grass was unusually heavy. W. R. B.

NEW YORK, July 18.

Thermometer in shade, highest, 98°; July 19, highest, 96°; July 20, 11.30 A. M., 86°.

PAINESVILLE, Ohio, July 17.

WEATHER hot, hotter, hottest. M. B. B.

Various.

THE TRUTH ABOUT IT.

[UNDER this heading, a number of articles have been prepared by able writers. These will appear from time to time. Their object is not at all to deal with "humbugs"—but with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

ORCHARD PLANTING AND MANAGEMENT.

T. T. LYON.

VERY many farmers who would not hope to secure a profitable crop of grain without thorough tillage, and with whom the idea of successfully growing a hill of beans, corn or potatoes, without previous preparation of the soil, together with careful after-tillage, would be thought preposterous, so far forget these fundamental ideas that, when they contemplate the planting of an orchard, their first step is to sow the field with grain, and then proceed to plant the trees, leaving the grain to grow up directly about them, while yet others either seed the ground to grass, in advance of the planting of the trees, or do so immediately thereafter. Indeed, I am not sure that I may not be warranted in the charge that the average of farmers act upon the idea that a fruit or ornamental tree only requires to have its roots thrust into a hole and the earth drawn about them, after which the tree is expected to take care of itself.

Whatever may be the conviction of the average farmer of to-day on this subject, and however much he may be disposed to repel so discreditable an idea, the fact remains that, if judged by their practice, they are amenable to the charge that a very large proportion—perhaps fully three-fourths—of the trees annually purchased by them, and planted in farm orchards, fail to pass safely through the first two or three years of their orchard life; not, as in most cases we are compelled to believe, from any defect in the condition of the trees, but rather, as in cases above assumed; because, even when tillage is not wholly omitted, the soil in which they are planted is taxed nearly or quite to the extent of its capacity, in the effort to supply the demands of the accompanying crop, while the newly-planted trees are compelled to acquire a hold upon the soil, and to push their rootlets through a space preoccupied by the hungry roots of the growing crop; and too often to struggle against them for the moisture and food required to supply the means of growth as well as the waste from evaporation of an entire top, left unpruned at the time of transplanting under the fallacious assumption that so much will be gained (saved), in the future growth of the tree; oblivious of the fact that, in the process of removal, the roots must have lost three-fourths, if not even seven-eighths, of their capacity to draw sustenance from the soil, leaving the tree in imminent danger of starvation before the deficiency can be remedied by a renewed growth of roots.

I feel assured of the indorsement of every well-informed and experienced planter, in taking the position that no possible circumstances can render it profitable to plant young trees, in grounds that cannot be subjected to culture with the hoe or cultivator, or both, while many planters, especially on light soils, consider it necessary or profitable to give up the entire soil to the trees, to the exclusion of even hoed crops. In fact, I am persuaded that, upon any and all soils, whether light or heavy, the planting of even hoed crops, among young trees, is mainly to be commended for the reason that it supplies an excuse, not to say a necessity for the kind of culture requisite to the prosperity of the trees, which, beyond doubt, would be the better for such culture, with the entire absence of all other crops.

Agricultural writers not unfrequently recommend the mulching of newly-planted trees as a means of subduing weeds, and preventing the drying of the soil and the hardening of the surface. I would certainly prefer that trees be well mulched rather than allow the earth to become hardened about them, or to become subjected to the exhaustion of its moisture by the roots of growing vegetation of any kind; but, to me, this would be only the choice of a lesser evil: just a little better than nothing. I do not believe that a good crop of corn can be grown under any possible system of mulching; and from the entire absence of practice, in that direction, even among our worst farmers, I infer that they also lack faith in such practice. Indeed, I can conceive no adequate reason why it should prove more successful in the one case than in the other. Few persons, I imagine, can have failed to observe how effectively, even in the hottest weather, or during the severest drought, the deep and thorough disintegration of the soil operates in bringing up moisture from the subsoil, for the refreshment of flagging vegetation. In the nursery, during the season for budding, the occurrence of heat and drought not unfrequently stops the growth of young stocks, rendering budding impossible; in such case the thorough stirring of the soil between the rows, will usually renew the growth, and again render the process practicable.

As a striking instance of the success of this process, I recollect that one of the most extensive planters and thorough cultivators of this State, with from one to two hundred acres of newly-planted orchard, a few years since, in mid-summer, discovered that, during hot, dry weather, his trees were forming terminal buds, indicating the closing of their growth for the season. Not satisfied with this he, by the vigorous use of the cultivator, soon succeeded in the renewal of their growth, and in obtaining a very considerable increase of the same, during the remainder of the season. I will, however, add as a caution against the too persistent carrying out of even a good idea; that, in this case the cultivation was continued, and the growth maintained till so late a period, that the advent of an unusually trying winter found the young wood so imperfectly ripened that the orchard was seriously injured in consequence. The lesson drawn from this untoward experience is, that such cultivation cannot, in this climate, be safely continued beyond the middle of August.

South Haven, Mich., July 8th, 1878.

CATALOGUES, ETC., RECEIVED.

THE Native Flowers and Ferns of the United States, by THOMAS MEEHAN. Published by L. Prang & Co., Boston, Mass.

Parts III., IV. and V. have been received. Part III. presents colored plates of Hellenias bullata, which the author proposes to call Studflower, as it has no common name. This is suggested to him from the specific Latin name "bulla," meaning nail heads or studded ornaments;—Carex stricta (Tussock-Sedge);—Cuphea viscosissima (Blue Wax-Weed);—Thalictrum dioicum (Early Meadow-Rue). This is interesting chiefly to the botanical student, the male and female flowers being borne on different plants. The leaves are delicate and pretty. Thalictrum cornuti, whose foliage is prettier, is blooming now.

Part IV. gives first Anemone patens, var. Nuttalliana (Nuttall's Pasque-Flower);—Orchis spectabilis;—Symplocarpus foetidus—(Skunk-Cabbage)—(Of this we have a very decided variegated-leaved variety found in the woods last year);—Pedicularis Canadensis (Common Wood-Betony), with its bright, curious flowers and fern-like foliage.

Part V. gives our Yellow Dog-tooth Violet (Erythronium Americanum), millions of which may be found blooming in moist woods before the buds of trees and shrubs have thought of breaking. This thrives well under garden culture, and even in dry situations, though seeming to prefer moist ones by nature. There is a white variety of this found North and West (albidum) which with the Americanum, yellow, and the European variety (Dens-canis) should provide the material for a fine race of garden hybrids. It seems queer enough that Mr. Meehan should seem satisfied to call our Erythronium "Yellow Dog-tooth Violet" which mixes up our species with the European, in preference to Yellow Addor-tongue by which it is already quite well known. Besides it is not a violet or anything like one.

The other colored plates are (second) Phlox subulata (Moss-Pink);—Saxifraga Virginiensis (Early White Saxifrage) and, last Arctostaphylos Uva-ursi (Bear-berry). The text of all is exceedingly interesting and filled with instructive and suggestive particulars.

ELEVENTH ANNUAL EXHIBITION, Jersey County Fair to be held at their grounds, city of Jerseyville, Illinois, commencing Tuesday Oct. 15. Premiums $5,000 in cash. MORRIS R. LOCKE, Jerseyville, Secretary. Entries in any department or class can be made at any time before the exposition, by application to the Secretary either personally or by letter, at his office and on the Fair grounds, up to 12 o'clock M., on Wednesday, October 16, except in cases of live stock to be exhibited in the arena, which must be entered before 10 o'clock A. M. on the day of exhibition.

NEW YORK State Agricultural Society. List of Premiums and Regulations for the Thirty-eighth Annual Fair to be held at Elmira, Sept. 9 to 13. Corresponding Secretary, Thomas L. Harison of St. Lawrence; Recording Secretary, William H. Bogart of Cayuga. Copies of the premium list and blank forms for entries will be furnished on application to the Secretary at the Agricultural Rooms. Letters should be addressed to the New York State Agricultural Society, Albany, N. Y.

PRIDE OF THE HUDSON RASPBERRY.—Early in the Spring Mr. E. P. ROE sent to us a number of plants of the above Raspberry. They have made a strong growth and each has borne fruit. Our opinion upon so brief a trial would be next to worthless. So far as it can be judged from the test of a single season, we can confirm the highly favorable reports which have from time to time been published.

We have now to acknowledge having received a quart or more of the berries at this office, in excellent condition, from Mr. ROE's grounds. The average circumference is little less than two and a quarter inches; the color bright red and the flavor as good as that of any variety of which we have any knowledge.

THIRTY-SECOND ANNUAL FAIR of the Burlington County Agricultural Society and the First Annual Exhibition of the N. J. State Horticultural Society, to be held at Mount Holly, N. J., on Tuesday, Wednesday and Thursday, October 8th, 9th and 10th.

PREMIUM LIST of the Indiana State Fair to be held at Indianapolis Sept. 30, to Oct. 5. This fair offers $10,000 in premiums. It is held under the auspices of the Indiana State Board of Agriculture of which Alex. HERON is Secretary.

PREMIUM LIST of the Georgia State Fair to be held at Macon, Ga., beginning Oct. 28, and continuing one week. Premium lists will be sent by mail on application to the Secretary, MALCOLM JOHNSTON, Macon.

VIRGINIA State Agricultural Society. Regulations and Schedule of Premiums for Fair commencing Tuesday Oct. 29. W. C. KNIGHT, Secretary, Richmond, Va.

The Poultry Yard.

PEKIN DUCKS.

SEVERAL here bought eggs of Pekin Ducks this Spring, all have proved a complete failure but mine. Several of my eggs were broken at Chattanooga, though I succeeded in raising three ducks. One is not doing well, I fear I will lose it; so in my trouble I write to you, hoping you will write me what to do for it. Please tell me what they are fed upon. M. L. J.

Brownsboro, Ala.

ANSWERED BY HENRY HALES.

In answer to several inquiries through the RURAL in regard to Pekin Ducks, I will give a brief account of them. As their name suggests, they originally came from China; in 1873 were first exhibited at Hartford in the fall of that year, and rapidly came into favor from their great size, fine laying qualities, and domestic habits. At their first introduction many doubts were circulated as to their laying qualities, and next, their merits as table birds; these points have been fully answered by the birds themselves; they are tamer, larger, better layers, and fully equal to any other domestic duck in flavor and quality. In fact, they are well worthy the praise bestowed on them. Their eggs are very slightly larger than the Aylesbury's, and they average more white-shelled eggs; sometimes they will lay white eggs for quite a while, when suddenly a bluish-green egg appears again. I have kept most varieties of ducks, but seldom had them lay in fall till I kept the Pekins; these will lay heavily in the fall when hatched early and having a river's edge to feed by.

To give these ducks their original large dimensions, a water-edge where fish is obtainable will assist their size; yet, like their cousins, the Asiatic fowls, they are content with small space when well fed; they are not more greedy eaters of corn than other ducks; considering their size, I believe they consume less grain, and they will eat much more grass. They feed on green food almost like a goose, where they can find it. They are fine ducks for the South, but our very cold snaps in the North seem to affect them, still they lay as soon as any other ducks. The young mature very early, when well fed—most kinds of soft food that hens will eat are good for them. Fish chopped up, such as clams or horse-shoe crabs is the finest food; but if one does not live near water, curd is very good if one happens to keep a cow, but there is no necessity to buy either a water-front or a cow to keep ducks. They are such good feeders nothing comes amiss to them: boiled potatoes mashed up with a little ground scrap-cake, corn-meal, wheat middlings, oat-meal, rice, soaked bread, are all good for the ducklings, and they want change of food often; but all meals are best scalded, yet raw meal will not hurt them, but they grow faster on cooked food. Soft food should be given cold and not so stiff as when given to chickens. They should not be allowed to go off to water until they are five or six weeks old; the water does not hurt them in warm weather, but they get into much trouble from their helplessness: such as not being able to get up a bank from the water and so getting left behind to perish; others get caught by turtles and other enemies. I make a yard with four long boards to keep them in before venturing to the water, with a large low pan of water in it, with one side tipped up, or a piece of wood for a step, that the ducklings can get in it; this can be taken up and washed two or three times a day. Also, stand a flower-pot, inverted, in their soft-food pan, so they cannot drabble through it dirtying their food.

When ducklings get over six weeks old, oats in a pan of water make a

GOOD FOOD.

When full-grown, potatoes and turnips boiled and mashed with a sprinkle of meal are very good, in winter a little scrap cake keeps them in health. Any kind of vegetable green food is relished; a little onion at times chopped up in it helps their condition. I should have said there must be a warm box for the ducklings in the yard, and they must be kept in during cold rains, as nothing kills them off quicker than cold rains, when very young, they not knowing enough to get out of the wet.

Doctoring ducklings appears useless, for when once they ail at all, they are hard to cure, except what can be done by change of food and care.

HENRY HALES.

The Swine-Herd.

DUROC SWINE.

RED and sandy hogs, called Duroc, have been bred in parts of New York, for more than fifty years. They have been crossed and recrossed upon other breeds during all these years, and their progeny have always retained characteristics of the original sire first brought into the county about the year 1823. Mr. Isaac Frink purchased him of Mr. Kelsey, of the town of Florida, Montgomery County, N. Y., who claimed to have imported a pair, the immediate ancestors of Mr. Frink's pig, from England. Mr. Kelsey was the owner of the celebrated horse Duroc, and Mr. Frink named the descendants of his pig Duroc, in honor of the horse by that name.

The Duroc pigs were popular and spread into Washington and adjacent counties, where they are still bred. They are undoubtedly descended from the same original stock as the Jersey Reds, now bred in the State of New Jersey, and hogs called Red Berkshires in some parts of New England. They were probably an offshoot or family of old-fashioned Berkshires. This opinion was expressed in the National Swine-breeders' Convention, and no one has yet controverted it. The old type of Berkshires often showed pigs of reddish cast, and at the present time this characteristic breaks out in the form of plum color, sometimes with a hue quite red. It is remarkable that one pig should have so strongly stamped his color and characteristics on his progeny that at this late day all of his scions exhibit more or less marks of the original type. Some of them have been crossed upon the modern Berkshires to such an extent that the old form is changed, the ears being erect and the body shortened, but the inevitable red, or sandy color, is carried along from generation to generation.

The true Duroc, as now bred by those who are aiming to keep the breed perfect and establish them as thoroughbred, should be long and quite-deep bodied, not round but broad on the back and holding the width well out to the hips and hams. The head should be small compared with the body, with the cheek broad and full. The neck should be short and thick, and the face slightly curved, with the nose rather longer than in the English breeds, the ear rather large and lopped over the eye. They are not fine-lined nor yet coarse, but medium; the legs medium in length and size, but set well under the body and well apart, and not cut up high in the flank or above the knee. The hams should be broad and full well down to the hock. There should be a good coat of hair of medium fineness, inclining to bristles at the top of the shoulders, the tail being hairy and not small; the hair, usually straight, but in some cases a little wavy.

The color should be red, varying from dark glossy cherry red, and even brownish hairs, to light yellowish red, with occasionally a small fleck of black on the belly and legs. The darker shades of red are preferred by most breeders. And this is the type of color most desirable. In disposition they are remarkably mild and gentle, and are so docile that they are readily confined by low fences. They are kind and careful mothers and wonderfully prolific. They have a remarkable ability to digest food and to make growth. This is owing to their hardy constitutions and perfection in the proportions of their bodies, and the strong blood which has made its mark so notably for more than a half century. It is a common thing for Duroc pigs at six months of age to weigh 300 pounds, and at eight and ten months to turn the scales at 400 to 500 pounds. Hogs a year and a half old have weighed from 700 to 800 pounds. Pigs four weeks old will weigh from 20 to 30 pounds and measure over two feet in length and from 6 to 8 inches across the shoulders. For rapid growth and ability to lay on flesh the Durocs are not excelled. The meat is not coarse-grained, but fine and tender. Their powers of assimilating food are so great that they readily eat coarse food more dainty breeds would not touch, and will even fatten on grass alone, and in winter will eat with avidity clover hay and roots that other hogs will refuse. They are not subject to mange or liable to get sunburnt.

TABLE OF CONTENTS.

PRACTICAL DEPARTMENTS:

Experimental Farm—J. B. Lawes' (Illustrated)... 469
Notes from Maplewood Farm—Hector Bertram.. 470
Drainage—R. C. Carpenter..... 470
Cooking Food for Stock—A. H. Ward..... 471
Sweet Potato Culture—M. B. Prince..... 471
Raising Flax..... 472
Klasona Notes—Sam'l Parsons..... 472
Notes from the Rural Grounds..... 472
Catalogues, &c., Received..... 475
Jottings at Kirby Homestead—Col. F. D. Curtis.. 473

THE

RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address

RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY JULY 27, 1878.

We offered, some time ago, to sell the cuts used in this Journal for ten cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

KEEPING AHEAD OF WORK.

A WITTY lecturer says that "some people have three hands." They have two hands the same as their neighbors, besides which they have always a little behind-hand. He might well add that this sort of men are wholly disqualified to be farmers, and if they are such, the three-handed farmers can never become forehanded. But, seriously, we have seen enough to prove that keeping ahead of the work from the opening of spring till the last job is finished in the fall, is the only way to farm with either pleasure or profit. The farmer who gets behind at any season works at a serious disadvantage ever after! And it is no easy matter to manage just right to keep abreast of the work. The direction of a large farm demands executive abilities as great as does the management of an army. The farmer has in fact an army; but his men are engaged in the work of production rather than of destruction. To keep two to ten men employed profitably in all kinds of weathers, requires thought and tact. The difficulty with most farmers is that they do not hire enough help. They underestimate the amount of work required, and make too little allowance for rainy days when little or nothing can be done out of doors.

Up to harvest time most farmers do pretty well. But unless work is pretty well advanced before haying and harvesting begin, it is pretty sure to be all in a tangle by the time the grain is in the barn. There are two, three or four weeks when little is usually done except securing the hay and grain crops. Then is the time when weeds run riot in potatoes, corn, beans and other hoed crops. We have often known fields to become so weedy in harvest time that the crops cost more to get out of the weeds than they were worth. Plenty of help at such times is all-important. Keep the cultivator going in the hoed crops though you have to pay harvest wages to do it. One day's work at the right time is worth five a week or two later. In the harvest field itself extra help is almost equally important. The present season is proving very showery and "catching" in many sections. When we have a really good day for curing hay or grain, there should be plenty of help to take advantage of it. We know farmers who at such times fit out an extra wagon and with two teams will keep the barn constantly filling. One or two men, if needed, are stationed in the barn to move away, and an equal number in the field to load. This rapid pushing of work is far the cheapest. Often after one or two days of fine weather we have rains which delay work in the hay or harvest field for twice that length of time. Meanwhile hay or grain is spoiling, and at last it costs more to get it housed in bad condition than it would at first to have it saved in good.

Of course, the good farmer will have all the labor-saving implements. This is the great advantage of using mowers and reapers. They will do the work with less men. The farmers, however, should not hire less; but employ the time and labor saved in getting the work promptly and therefore more cheaply done. Whoever uses mowers and reapers merely to save hired help gets very little advantage from them. In all probability he will lose as much on other crops, and possibly more than he will save in hired help. We know that prices of farm products are low; but labor is also nearly or quite as cheap as before the war, and considering the improvements in farm machinery, farmers can get more done for ten dollars now than they ever could before. The temptation to many farmers is to save in their help-expense account. But if the farm is worth working at all it is surely worth working well, and the larger the amount judiciously expended for farm labor, the larger will be the profits and the greater the improvement of the farm itself. Doing with too little help fills the soil with weeds, and where these obtain control, all hope of profit is at an end.

TRANSPLANTING.

WE once successfully transplanted in July, a young Grape-vine three feet high. The ground was daily watered plentifully for a month. We read that evergreens may be transplanted at *any* season of the year, if—if—if. The fact is small plants may be so transplanted that the slight disturbance to the roots and the after care are equivalent to no derangement of the plant economy at all. But the question is when is the *safest* time to transplant—that is, when is the time that a plant will best stand the disturbance usually attending transplantation. We say that, as a rule, spring is best for all climates like New York and north of it, in which the thermometer falls to ten degrees below zero, and lower, and just so soon in the spring as the frost is out of the ground. For climates like those south of Philadelphia, fall is no doubt better than spring, because the roots make some growth during the winter and a reciprocal action between the roots and buds and leaves is sooner established when spring growth begins.

For this climate, and north of it, many say that they prefer to plant in the fall, as soon as, or before the leaves begin to fall. Then, they reason, new fibrous roots are formed before settled cold weather, and the tree is so much ahead of that transplanted in spring. This reasoning might hold good if we could always be assured of such a mild winter as the last. But we believe that continued severely cold weather, which freezes the ground two feet or more in depth, will kill those tender roots formed in late fall, and that the tree will be found *less* vigorous than the one transplanted in early spring.

When trees make a late growth that has not time to ripen, not only will a severe winter kill the late growth, but the plant itself will be weakened. It is the same with the tender root-fibers.

If the northern farmer or horticulturist is so pressed for time in the spring that he is willing to take the chances of failure resulting from a severe winter and transplant in the fall, let him do so. But if our experience has taught us anything it has taught us that spring-planting is preferable to fall-planting in the ratio of at least three to one.

NEW VARIETIES OF ERYTHRONIUM.

WE cannot find that any attention has been given to the production of new varieties of this earliest of the spring-blooming Liliaceous plants. We have Erythronium Americanum, our native Adder's Tongue; also a white species E. albidum found north and west. Then there is the E. Dens-canis, the European species which is sometimes purple, sometimes rosy-lilac, sometimes white. Here we have as wide a range of colors as in the begining we had with the Gladiolus, a flower that has been more improved perhaps by artificial treatment than almost any other.

If these bulbs be taken up after they are matured, which may be known by the fading of the leaf, and planted in the garden, the size of the flowers will be increased and the bulbs will thrive as well as in their moist native habitats. Crosses between the purple, white and yellow could no doubt be effected which might perhaps result in beautiful intermediate varieties.

REPLY OF THE MAINE FARMER.

"THANK you, Editor of the RURAL. it *was* "an oversight." The enterprise of the RURAL NEW-YORKER (which, by the way, has been somewhat enlarged and much improved of late) secured for its columns a contribution from Mr. J. B. Lawes, of England, which article the London Farmer copied—giving credit, however, to its American contemporary—and we copied a paragraph or two from this article, giving credit not to the RURAL, as we should have done, but inadvertently, to the London Farmer. We are sorry to have been led into this error, but glad our attention has been called to it, that we may give credit to whom it justly belongs."

Upon reading the above we were reminded of the Latin proverb, "*Bis dat qui cito dat*"—he who gives promptly, gives twice as much—except, in this case, the oversight was one so liable to occur to any of us that we feel we have received ten times instead of twice our due from the Maine Farmer. We once knew a man that prided himself upon the fact that he had never made an apology in his life. But how could we appreciate the beautiful in this world if there were nothing ugly with which to contrast it!

BREVITIES.

MAN is "a bundle of habits."

J. J. MECHI is 76 years of age.

IT is now time to make cuttings of Pelargoniums and similar plants for late autumn blooming.

IN the way of green food, we have found nothing that poultry like better than Pearl Millet. The leaves, however, are still young and tender.

CUTTINGS OF HOLLYHOCKS may now be made of desirable roots, and many of the improved varieties are very desirable. The bottom shoots are best. Insert in sand and keep moist.

MR. WM. ROBINSON dedicates the thirteenth volume of his enterprising Garden (London, England,) to Dr. Moore of Glasnevin, in recognition of his long and faithful services to horticulture.

ANY of our readers who have cultivated any of the following Spring wheats will much oblige us by communicating the results: Champlain, Defiance, Mediterranean, China, White Spring Russian.

A HARD shower prevailed here (Rural Farm) this afternoon, Sunday, July 22. Of the spring wheats, one-third of White Russian is lodged and one-quarter of Champlain. Of the five varieties, Defiance is last to ripen.

"THOSE defenders of the faith are more zealous than wise who must needs fire away in their catapults the very bastions of the citadel in the defence of outposts that have become untenable"—*Dr. Asa Gray.*

OAT meal tea is an excellent drink for the harvest field. Put about fiftoen tablespoonfuls of meal into a gallon jug, adding some salt. Fill up with boiling water, stirring briskly. Then let it stand in a cool place until needed.

ENTOMOLOGISTS describe only four varieties of insects parasitic upon the bodies of hens, not including the mites of the chicken-house. Our correspondent, Mr. Hales, has sketched twelve additional varieties. He thinks there are others yet.

THE Michigan Farmer, whose opinion in such matters is entitled to much weight, anticipates that there will be a general drop in the price of wheats from this time till the income of the crop, when it will probably settle down to the lowest figures known here since 1853.

FOURTEEN years ago several fields of the "Rural Farm" were "alive" with the Wild Radish (Rhaphanus Rhaphanistrum). They were wholly extirpated by pulling them up as soon as the yellow flowers appeared. It is an annual, and of course is propagated by the seed. We mention it merely to say that the labor of eradicating this weed was far less than was supposed before the pulling-up process was begun.

"THE farmer who will carefully consult the catalogues of seed merchants and nurserymen, look for markets near home, and keep his wits as busy as the successful manufacturer must do, says the N. Y. Herald, will find in the long run that the most money does not come from the most popular crops or the greatest number of acres under cultivation."

That is true; but it is not the seedman's catalogue that is going to tell him what crop there will be an extra demand for. That gives the list. The farmer must judge for himself.

A NEW USE FOR POTATOES.—Potatoes are to come out as a manufacturing medium, and *Le Cultivateur* says that pipes similar in appearance to meerschaum are made by the following process:—You take a potato, and having peeled it, place it in water acidulated with sulphuric acid, in the proportion of 8 parts acid to 100 parts of water; let the tuber remain in this liquid for 36 hours to blacken, then dry it with blotting paper; you then submit it to a certain pressure, when you have a material which can be readily carved to any design. The counterfeit is marvellously perfect. By the same process a very good imitation of horn can be obtained, sufficiently hard and dense to make billiard balls, &c. A striking resemblance to coral is obtained by treating carrots in the same way.

ALL poultry authorities agree that poultry, especially chickens of course, should be fed "little and often." Our chickens and hens which are confined are fed five or six times every day. Besides grain food they are given all of the table scraps, finely cut meat, both cooked and raw, grass, clover, beet-tops, pea-tops, radish-tops, etc. We are raising chickens and keeping them confined (fifteen to an area about thirty feet square) as an experiment. Fine ashes in which a little flour of sulphur is occasionally mixed, is supplied for them to dust in. The house is whitewashed often and the droppings removed from the floor every few days. We have not yet had a case of sickness.

THE essentials in keeping butter in Summer consist in making it properly, and having a cool place to keep it, and excluding it from the air. No butter can be safely packed in warm weather which is not perfectly made, nor can it be kept if exposed to the air. Dairy-rooms cooled with a cheap refrigerator are coming into use now among butter-makers, both for keeping milk and keeping butter, and with ice and salt, secure a low temperature at small cost. The best packages for keeping butter a long time in warm weather are made of tin, and wood-lined. When filled the cover is soldered on and made air-tight. So says Prof. Arnold in the Weekly Tribune.

HENOPHONES.—The London Farmer says, it must draw the line somewhere. It has so frequently received "facts" from America which turned out "fancies," that it does not accept with implicit credulity the statements of its contemporaries on the other side of the "horring pond." It believes in the telephone but not in the "henophone." An exchange states that an intelligent farmer has invented a henophone. A henophone is modeled on the principle of the telephone. One old, reliable hen, occupying a central office in the hennery, sits on all the nests about the establishment, leaving other fowls free to lay eggs, scratch, and cackle. As soon as a new nest contains the full complement of eggs, it is connected with the central office by a copper wire, and the business is settled. The only trouble with the machine is, that it sits so hard it hatches out the porcelain nest-eggs with the others, so that one chick in every nest is born with glass eyes, and the farmer has to buy and train a dog to lead it around. This, it is said, makes it expensive. Hereafter the London Farmer will draw the line at "henophones."

THE Colorado beetle has been subjected to a series of experiments by a member of the Entomological Society of Ontario. Mr. W. BRODIE, of Toronto, has been studying its peculiar tastes for food, and also its fasting powers. Mr. Brodie, having kept thirty beetles without food for twenty-four hours, they refused leaves of carrot, parsnip, beet, pumpkin, lettuce, sunflower, sage, and cabbage. After eight more hours, when supplied with potato leaves, they ate them freely. A similar experiment was made and repeated with a large number of common weeds, but none was eaten. Again, thirty beetles, after being kept eleven days without food, were given the leaves of a large number of weeds, which remained untouched. Potato leaves were then eaten freely. Three repetitions gave the same results. To ascertain how long they would live without food, of forty-five beetles which were allowed nothing to eat after changing to beetles, four died the fourth day, thirty-three the fifth day, two on the sixth day, and three more by the eleventh day. Over 75 per cent. died within five days, the males dying first. The next experiment was to take thirty mature beetles, which had partaken of food; they were then kept without it. Two died the fourteenth day, six by the nineteenth, five by the twenty-third, three more by the twenty-seventh, while 20 per cent. survived forty-seven days' fasting. Other experiments were made, by which it was ascertained that on an average one beetle will eat an inch square of potato leaves in thirty hours, the maximum rate being ten hours and the minimum thirty-seven hours. One beetle is able to defoliate entirely one plant of potatoes during its beetle life.

FANCY BULBS.—Mr. J. J. Mechi is a believer in the influence of soil, climate and food, on human, animal and vegetable development. Hence there will be always great varieties in all vital subjects. Starvation causes diminution and malformation, especially when accompanied by an unkindly climate. Perfect development results from an opposite state of things. In rich and free soil or highly-manured land fibers are multiplied, and a single tap root does the needful; but where the plant food is widely and sparsely distributed bulbs will send out powerful fangs in search of it. When he impoverished his surface soil by steam ploughing it very deeply, and mixing with it a large quantity of poor and unaired subsoil, the plums in the pudding were too far apart; and the mangels knew it, and accordingly sent out searchers in the form of long and thick fangs, which brought to their bulb the good things which were widely diffused. Feeble-rooted plants could not have done this. He protests against the supposition that these fanged mangels are of inferior quality. On the contrary, they are dense and heavy, and keep well, and have the advantage of having buried their bulbs deeply in the soil, which is always a sign of quality, either in turnip or mangel. When his top soil is again rich, no doubt these mangels will use fibers, and only send the tap-root down to pump up moisture for the circulation. Red clover acts much like mangel, and goes deeply into the soil. A father and son divided some oats which they purchased of him. The father grew an abundant crop of excellent quality, the son's crop was wretched in sample and quantity. The different quality of their farms—both in his county—explained the apparent mystery. Plants, like animals, are grateful for good feeding and other suitable conditions. A turnip in deep rich land will send a single tap root a yard or more deep, but not so on poor, shallow or ill-cultivated and undrained land.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

ON BROADWAY.

SEE! Young America, his active arms
With bundles laden,
Escorting in a slipshod kind of way
A pretty maiden.
Often she drops a yard or two behind
Before he's missed her.
Ah! her relationship is plain—
His sister.

And close behind the couple we have seen
Appears another—
A young man with a venerable dame—
Of course, his mother;
For he has with a patronizing air
Her ear enlisted,
And tells her things of which she was aware
Ere he existed.

Another pair, who walking far apart,
Scorn conversation,
He eyeing all the young and blooming girls
With admiration;
She with a weary air, and loaded down
With goods he should have carried,
Seems filled with care; alas! the fact is clear.
These two are married.

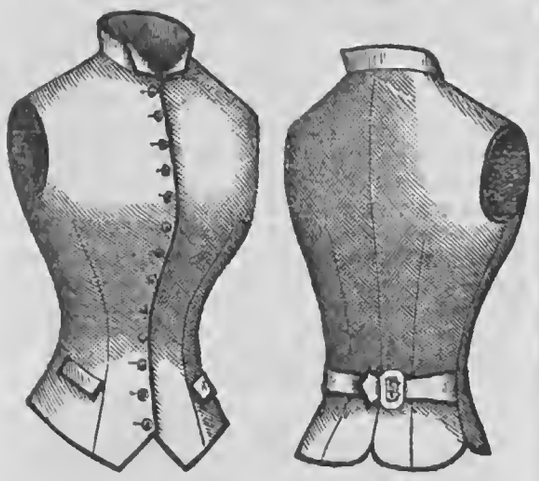
One couple more—their hands are slyly clasped.
They seem devoted.
The glances of sardonic passers-by
Are all unnoted,
Her eyes—the color of the radiant sky
So bright above us—
Look fondly into his. Come, let us go,
These two are lovers! [*N. Y. Sun.*

FASHION NOTES.

THE favor with which ladies have this season regarded costumes of washable goods has stimulated merchants to a display of many elegant novelties in this line of goods, and the prices at which they are offered tempt a woman to spend all her pin-money in buying up a stock of these beautiful materials.

In organdies, *Tilleul*, new gold, *beige* and *Havanne* tints are the newest, although pale-blue, rose, lavender and white are as popular as ever. On tinted grounds, the pattern is generally in the darkest shade of the same and in graceful clusters of blossoms, trailing foliage, sprays of rose-leaves in natural dimensions, wheat-heads, rose-buds, bouquets, &c.

Lawns with white grounds have gay little buds and blossoms, delicate vines, dainty grain-heads and starry flowerets in blue, black, purple, brown, green, drab, pink, etc., and are generally edged at one side with a fancy border, introducing the color of the pattern with or without gay tints. Lawns and organdies also come with unbroken grounds in white or tints, with borders representing gay wreaths on black or dark grounds, or else "lace pattern," borders, either being as pretty as one could desire.



6242 6242

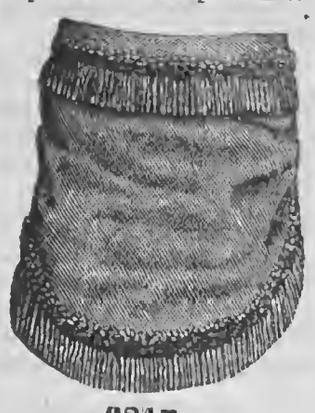
Bordered and unbordered lawns and organdies are about equally popular, the selection of either being more matter of taste than fashion. Coming to the more substantial fabrics, we find gingham, which, though it is nothing more nor less than gingham, is robbed of half its old-fashioned familiarity by new patterns and the new names of "Scotch Zephyr cloth" and "Madras suiting." Those of the plaid patterns which remain show the new colors in many of their commingings, while others still glory in the harmonious blue, gray, soft pink, and pale yellow, which combined in a regular oiass pattern, produce such a mellow, yet distinct effect. A few new ginghams show bourette designs, and others shaded stripes; while plain ginghams are presented to combine with the above patterns in accordance with the "two-shade" mania now affecting all costumes.

In linens, there are a few novelties, some of which may be classed as durable, and others as purely ornamental. Of the latter, there is a transparent variety called *crepe batiste*. It has the effect of very fine Swiss in its weave, but is wiry and has the gloss peculiar to linen. It comes in pink and the most delicate tints of *beige*, blue, cream and pink, and is exquisitely fairy-like in its effect when used for over-dresses to silk skirts that are trimmed with it. While it will wash, it still must be classed as ornamental, as it loses its delicate transparency through the process.

Durable Batistes have dark grounds, the color being a cross between the unbleached yellow and the drab shades. The new ones have tiny, clouded bourette checks of navy-blue, and white, or of brown and white, or bright blue and white cross-lines, and clouded yellow cardinal, blue, green and white lengthwise hair-lines. A bayadere bourette has its lines in cardidal and white, while other Batistes have patterns of self-color, white, black, brown, etc., in honey-comb pattern.

Trimming for Washable Fabrics.

The delicate organdies are prettiest when trimmed with themselves, and a dainty edge of either Italian or Smyrna. When the fabric is to be used it is formed into gathered or plaited ruffles, edged at each side with narrow lace, of widths appropriate for the portion to be deco-



6245

rated. Plaited ruffles are stitched on just below the top, and straight ruffles are gathered with a cord also about an inch from their upper edges. Two or three rows are placed upon the skirt, one on the polonaise and one about the basque, (if that takes the place of the polonaise); and generally two at the wrists, and a standing and falling one at the neck. When a fichu or mantle is worn, one is about all its edges, unless it has a regular neck, in which event two are used, the same as on the basque.

It is now a pretty fashion to take two or three shades of ribbon, about an inch or an inch and a

6245

quarter wide and form natty bows, using one or two of the shades as lining to the other, so that the edge shows at one side of the loops. Short, sharply-notched ends are also used with these loops, generally being no longer than the loops. The lace upon the edges of the ruffles may also have its dash of color. Some of the Italian and Smyrna edgings having pink and blue borders, or the two shades mixed, or else having a mixture of blue, olive, rose, etc. The same suggestions apply to lawn and Swiss, both of which are charmingly decorated with frills and bows

In using borders to lawns and organdies they are applied either as a heading to the trimming mentioned, or as a border to flounces; and when the latter arrangement is decided upon, the border is sometimes edged with lace and gathered or plaited to finish the over-dress and fichu.

In white Victoria lawns, nainsooks, cambrics and other opaque white goods, Hamburg embroidery, either white or colored is selected in preference to lace. In white a frill headed by an insertion is generally used, and sometimes a narrow edge stands from under the upper side of the insertion. In colored, there is deep blue, pale

6246

blue, cardinal, pink, brown and black, either separated or combined. These embroideries are used upon piques, ginghams and printed goods with a very pretty effect

Many materials, such as piques, linens, ginghams and prints are being cut in slashes, scollops, points or tabs, which are either bound with bias strips of the material or white cambric, or white braid: while the latter is put to a variety of uses, such as straight rows, scollops, curves, jacket and Breton outlines, and panel decorations. Bands and folds of the same or a contrasting shade, piped white or dark cambric hold their own, and with the plain mentioned and other fancy braids, form fashionable flat decorations.

Ruffles of the material are now generally cut straight instead of bias and trimmed with bias bands or else plainly hemmed, or perhaps outlined by rows of braid. A bias band for the heading is generally selected, as it irons nicely and produces a flat effect.

Smyrna and *Ecru* laces are principally used upon linen Batistes and also upon ginghams, the tint of the fabric determining the choice of the lace.

Plain linens are generally hemmed or slashed and bound or trimmed with bias bands piped at the edges.

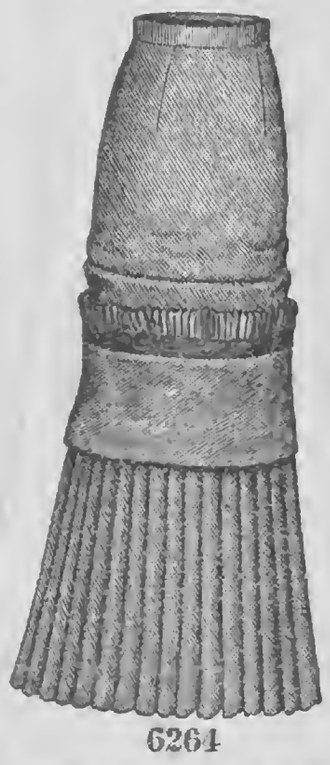
Barege and Crenadine.

This year back comes the old-fashioned barege. It possesses many advantages, among them is its

6246

concealing qualities. An old silk skirt may be used for a lining, with many a piecing seam which this thin fabric refuses to reveal. It may be made over alpaca, or above a silk-dressed Silesia, without injury to its elegance. Bareges are not expensive, and yet they are quite as lady-like as brocades or Mexicaines.

Among the latest novelties in costly goods are grenadines, with bourette effects—chenille lines, knots, loops, and tufts, which are woven into the tissue irregularly. They are intermingled with silks and made up into polonaises.



6264

Among the iron grenadines and bareges and among the *beige* buntings, real buntings and seaside grenadines, much effectiveness of combination is secured by the uses of both a plain and a plaided or striped material of the same quality, a pale blue skirt with a blue polonaise of the same shade, striped or plaided with *beige* pale-rose or silver-gray, and having blue sleeves or other interminglings of the goods, make a most charming costume.

Iron grenadine will be held in respect by elderly ladies, and also by ladies who wear mourning costumes. Barege will share favor with iron grenadine for black costumes, and especially will this be true in dresses for young ladies who are in mourning.

Perhaps the most distinguished material in point of richness of quality, and royalty of effect is the "velours grenadine," as it is sometimes called. It is a brocaded fabric that is thin, but so filled in with flossy or satiny threads, artistically brocaded together, that no figures are distinguishable. This material is very costly and is used but sparingly in combination with silk which it serves to illuminate beautifully.

6264

Veils and Scarfs.

Made veils are straight at the top and rounded upon the fringed or bordered edge; but owing to their inconvenient length, ladies continue to purchase plain or dotted, black or white net of the

FIG. 5—LADIES' HOUSE COSTUME.

length best adapted to their bonnets and arrange it as best suits them. Regular veiling with or without dots and having a chenille or shaded silk-broidered border comes by the yard, and is very becoming to some faces. The preference, however, above all this fancy assortment remains for the strip of plain black Brussels net for general wear, and white illusion for dress, unedged and unembroidered.

By scarfs, are generally meant those of lace. Spanish or Guipure net two and a-half to three yards wide broidered with corresponding edging is worn draped about the shoulders and tied in a single knot over the breast. Shorter scarfs are about a yard and three-eighths long, by one quarter of a yard wide, and are generally secured with a scarf-pin close under the points of the collar. Necktles are worn between the military and linen collar, or inside the linen collar and knotted in a double bow very carelessly under the chin. In silk ties those most in favor have a center of one shade and sides of another; the whole covered with an intricate and minute brocaded vine. Silk scarfs are very fanciful in effect, but have been almost universally laid aside on account of the season for the more suitable ones of sheer muslin, batiste or lace. The newest are white muslin with ends deeply embroidered in the fashionable tint of blue, cardinal, olive, etc. Other all-white ties have ends of an open pique embroidery that is very neat. Lace ties have their edges chain-stitched to hold a half-inch hem, and their ends are broidered in Marguerites, blossoms, scrolls and foliage, either in white or shaded silk.

Description of Cuts.

Figure 5.—Ladies' Costume. The skirt is walking length, and is cut by pattern No. 6053; price 35 cents. It is six-gored and requires no decoration, although plaited or gathered ruffles may be added about its entire circumference or to the front and sides only. The over-skirt is one of the latest models. The *tablier* is deep and wide and forms an irregular outline at the bottom where it is

6274 6274

corded, and then edged with fringe. At each side it is overlaid with a semi-circular portion that with it is joined to the belt and a long back-breadth, the latter seam also confirming a *revers* extending from the belt to the bottom of the *tablier*, and turning backward over the breadth. The bottom of the *revers*, and the rounding edges of the side portion are each furnished to correspond with the *tablier*, while buttons in clusters extend along the *revers*, the lower corners of which are caught together over the breadth by the lower button. The breadth is formed of cashmere, and is laid in plaits at the top, while its edges are square and undecorated, being simply hemmed or forced underneath. Lace, plaitings, bands, or folds may be used in trimming an over-skirt like this, the variety selected depending upon the material used and the taste of the individual. The pattern is No. 6239; price 35 cents.

The basque is very stylish in shape and construction, and is elegantly proportioned. It is No. 6,238, price 30 cents. For plain goods or a combination of grenadine and plain silk, this is a very handsome model.

No. 6,216.—Ladies' Plaited Blouse, with a "Stole" collar.—This model is one of the many designed for washing fabrics. A novelty in collars is worn about the neck. It is called a "Stole" collar, and its shape at the back is a regular sailor style, with which the front corresponds in outline, although a narrow space intervenes between its front edges. It is closed by two frogs, and by its square appearance gives a peculiar effect to the garment. The new bourette cambrics are handsome made up in this way and decorated with folds of the material of a uniform color, or pipings of the predominating tint. Linen, lawn, muslin, organdy, flannel, or any other fabric may be elegantly made up by this model. Price of pattern 30 cents.

No. 6,245, Ladies' Scarf Wrap.—The quantity of material requisite for a wrap of this style is so small that a lady can easily procure one of these dainty articles with but a trifle of expense. The wrap is all in one piece and is deepest at the back, where it falls a little below the waist line. Any of the materials generally employed for the construction of wraps may be made up by this model and trimmed with any of the fashionable laces, galloons or fringes. Grenadines, organdies, lawns or cambrics are also charming made up in this way to complete a costume. A warp of this style made of crape, lined with silk and trimmed with grass fringe, would prove an elegant completion to a morning costume. Price of pattern, 20 cents.

No. 6,242—Ladies' Vest.—This engraving illustrates a charming vest, that may be composed of any material that will either harmonize or contrast with the jaunty out-away jacket with which it is to be worn. The vest requires but a small quantity of material, as the back is always made of lining. Hence a lady may have several vests of different colors and materials, to wear with the one jacket at different times. Price of pattern, 20 cents.

No. 6,274.—This dress is a very stylish one for the little folks, and is so simple in structure, that very little labor will be necessary to complete it. It may be made of fancy, desirable fabric, and ornamented with plaiting, ruffles, bands, braids, pipings or lace disposed in any way to suit the taste. The pattern comes in six sizes for children from one to six years, and costs 20 cents.

No. 6,275.—This jaunty, little costume consists of a jacket and kilt, each made of mixed brown-and-white summer cloth, trimmed with scal-brown mohair braid, and bone buttons. This costume will be popular for boys during summer season, and also during the coming fall and winter. For the present it will be made principally of summer cloth, which can be obtained in all the fashionable mixed gray, brown, and olive shades. To wear in the country, gray or navy-blue flannel will be both pretty and stylish. Linen is also

6275 6275

available, and will be both cool and serviceable. The pattern comes in five sizes for boys from three to seven years of age. Price of pattern, 25 cents.

No. 6,264.—Ladies' round, short skirt, with deep yoke and attached overskirt. This presents a charming skirt, which, in combination with blouse-like model No. 6,245, would complete one of the jauntiest costumes of the season. Pattern costs 35 cents.

Figure 1.—Misses' Walking Costume.—The introduction of cottons that closely resemble the pretty bourette fabrics of the past season, makes costumes of washable goods generally popular, and, therefore, a number of modes suitable for fabrics of this description have been completed for the summer months.

The cut represents a costume including two of them, and also a skirt that is just the accompanying style they require. The jacket which is here used as a basque, is half-fitting, clasped by a bolt which may be of the trimming material as illustrated, or of ribbon metal or leather as preferred. A shawl collar passes across the neck of the back, and extends down the front for a few inches, its pointed ends finally meeting at the closing, which is performed with button-holes and buttons. A bow of ribbon conceals the meeting, and lends a jaunty air to the costume. The collar belt and simulated cuffs are made of plaid material, while a bias band of the same is the bottom of the garment. The overskirt is very simply formed and draped, and is trimmed to correspond with the jacket. The skirt reaches to the ankle, is shirred at the back to keep its fullness in place.

Fig. 1—MISSES WALKING COSTUME.

The bottom is trimmed with a flounce or ruffle of the plain print bordered with the plaid, and is gathered and set on so as to form its own heading. Any other method of trimming may be employed in furnishing the skirt such as kilts or side-plaitings of the plain goods set under a band of plaid or a band of the same piped with the plaid, or the skirt and trimming may be of one material if a combination is not fancied. The pattern of jacket is No. 6,201, and costs 25 cents; that of the overskirt is No. 6,200, cost 25 cents; that of the underskirt is No. 6,058, cost 35 cents.

Any of the patterns mentioned in this article may be purchased for prices named. Explicit printed directions accompany every pattern. The purchaser is told not only how to put the pattern together, but also the number of goods required for the garment.

If ladies who are about to dress-make would like any suggestions about styles, materials, or any hints as to how they can best remodel old dresses, I shall take great pleasure in furnishing any information which will help them out of their difficulties. FAITH RIPLEY.

Literary Miscellany.

MARGARET'S VICTORY.

H. E. CLIFFORD.

(Concluded from page 462.)

Thus, time passed till the approach of Christmas, the anniversary of the time when Marjie first met Herbert Elliott.

It was the week before Christmas, and Marjie had consented to visit the neighboring city of B—— to execute the numerous commissions of mother Edwards, and some of her good neighbors, incident to holiday festivities.

That morning she had received a letter from Herbert, and such a strange letter it was, too; he seemed to feel such a tenderness toward her, and yet there was not a word of love in the whole letter, but it was rather expressive of deep sorrow; as if some great calamity had befallen him: he charged her not to be anxious if she did not hear from him again in several weeks, and said if she lose him entirely, she must not mourn; then, as if to explain, he added, "for you know Marjie, dear, we must all die sometimes."

Taking it altogether, it was, indeed, a very strange letter; and all day Marjie had pondered over it, till the tenor of it seemed mingled with the yards of lace and muslin, and the pounds of confectionery she was purchasing.

At early nightfall, she entered the railway car that was to bear her home, so weary in body and mind, that she was scarcely conscious of her own existence. Only one seat was vacant, and that behind two men, whose appearance was anything but prepossessing. Marjie was too tired to hesitate for this, and, with a feeling of genuine relief, she sank down upon the yielding cushions, and rested her aching head against the casement.

After a few glances at her, the men continued their conversation in a low tone, and when the train started, one of them removed his coat, and carelessly flung it over his seat, allowing some letters and papers to drop from the pocket to the floor, at Marjie's feet. With a muttered "beg pardon, mum," he quickly stepped around and gathered them up, placed the coat in a safe position, and resumed his conversation.

A few moments later a brakeman passed through the car and the light from his lantern showed a letter on the floor of Marjie's seat, that had escaped the man's notice. She bent over and picked it up, in a dreary sort of a way, intending to hand it to the owner, but there was a strangely familiar look about that letter and, turning it toward the light, she read, though partially obliterated with a pen, "Return to Elliott & Co., Wholesale Grocers, N. Y." Instantly her apathy was gone, every nerve was on the alert, and with trembling fingers she drew forth the contents of the envelope and saw it was Herbert's handwriting. Not his usual bold, clear hand; but she was sure it was his—though why should his hand tremble so? It was never so in her letters.

This was only a short note. The printed business heading of the paper had been torn off, and there was no address, simply, "December 24th, 1875, 12 o'clock;" and no signature.

Hastily concealing the strange document, Marjie strained her ears to catch some word from the men that might unravel the mystery. The conductor's call for tickets caused a momentary lull in their conversation, and ere the silence was again broken Marjie had leaned heavily forward as near them as she dared, and was apparently asleep. But their words were guarded and she could get no clue to what was nearest her heart, only now and then a sentence, interspersed with oaths, such as, "Poor speculation fixed him, I guess;" "Of course he'll do it, he has got to or else go up;" "Back out! why I tell you he can't, we've got him in black and white." A whispering, of which she could distinguish nothing, followed, and then the remark by the younger of the men, "Ain't twelve early?" was answered, "Yes, rather, but that street is quiet early."

It was plainly evident to Marjie that mischief was on foot, and that in some way it concerned Herbert Elliott; but how, or where, or what it was, she could not tell.

A moment more and their tones were again audible, and she heard the elder one say, "No! we don't want to cut him much, only tie him fast and bruise him a little." Although this might be a link in the chain, still it gave her no light on the all important subject—how Herbert Elliott was connected with this plot.

As the slackening of the train gave warning of a station, one of the men carelessly remarked, "Ain't this where Ed meets us," and began to watch the door where a few new passengers were entering. Soon a man with a heavy black beard, and a fur cap drawn over his eyes, entered; and the one who had just spoken attracted his attention by a peculiar whistle. He came directly to them, and after a rough meeting said: "How is the York job on Elliott?" Which was answered by an oath and command of silence from the party addressed, and a frightened looking around by the other. The new comer was evidently much under the influence of liquor, and it was a constant task for his companions to keep him from talking audibly on matters they seemed to consider decidedly confidential. He insisted on being fully posted on some subject of which he now possessed only a partial knowledge. And after some hesitation and an anxious glance at the apparently sleeping woman near them, the first two consented to explain.

Now was the critical moment for Marjie. A few moments more would bring her to the end of her journey. It was now, or never, to solve the mystery. The light nearest her burned low and the dim light allowed her to draw still nearer the group in the advance seat. In a low, cautious tone, one of the party began to relate the particulars of the case in question, and Marjie dared scarcely breathe fearing she might lose a word of what she believed would explain how a letter from Herbert Elliott came in possession of these strangers. The first words she could understand were, "Fact is, the youngster got cramped, and the old man shut down on him; the feller must live somehow, and he——" Here she lost a sentence, and, fortunately, the third party in the other seat also failed to understand it clearly, and they repeated for his benefit, and she caught the words, "firm stock did it, and the job will cover up——;" and again their voices were unintelligible, and she heard no more except the careless remark, "Don't want to do it, but we had him foul, and he dare not squeal on us."

That was all, but every word she had heard was indelibly impressed upon her mind. A few moments later she was snugly tucked in Farmer Edwards' sleigh and was soon at home.

"Why! what on earth ails the child," exclaimed Mother Edwards as Marjie entered the kitchen with such a pale face, and a wild look in her eyes.

"Nothing, mother," was her quiet answer. "Only I'm so tired and have a headache; let me go to bed and I shall be well in the morning."

After a cup of strong tea and a feeble attempt at supper, Marjie sought her chamber, but not to sleep.

On entering, she locked the door, and dropping on her knees beside the snowy couch, she poured out such words of prayer as only a heart burdened with sorrow and rich in faith can offer; then rising in the possession of new strength for the task before her, she took the letter from her pocket, and calmly unfolding it, read again "December 24th, 1875, 12 o'clock," but it was still a riddle. Clasping her hands tightly over her throbbing temples, she bowed her head and remained several moments lost in thought. Then, raising her eyes slowly, she spoke low and clear, as if by inspiration, "Yes, I see it now; it is all plain to me. Herbert Elliott has become financially embarrassed, and by some careless indiscretion has incurred his father's anger and dare not ask his assistance; every endeavor to recover himself has only led to fresh reverses. This explains his distraction and coldness in correspondence. In a moment of weakness he has yielded to temptation and appropriated funds not his own, hoping to restore ere the loss was discovered; but the closing of the accounts for the year comes too soon for him. Some one who has gained knowledge of these circumstances has offered him this way of escape, and waiting till every other hope

has gone, he has yielded to this base step by a league with robbers, whom he has promised to admit to his father's store at midnight, December 24. He will allow them to bind and beat him to cover his sin, and perhaps they will kill him." A shudder shook her slight frame at the thought. "It's all clear to me now," she said. "Oh, Herbert, my poor Herbert! He has been tempted sorely, for he is not bad at heart, and I will save him. Yes!" clasping her hands tightly and raising her eyes to heaven, "with the help of heaven I WILL SAVE HIM."

There was no hesitation about her movements now and no tremor in her voice as she spoke her thoughts aloud. What was before her or how she was to accomplish her object she did not stop to consider, but seemed to be led by some unseen impulse and passively obeyed. Her only thought was to reach her lover without delay. It was Thursday night, and by to-morrow at this time she must be in New York. Not a moment was to be lost. Quietly gathering a few necessary articles together, she packed them in a small satchel and selected a plain traveling suit to be worn. Then, taking a railway guide that Herbert accidentally left and a small map of New York city, she occupied herself for an hour in gaining such knowledge of the undertaking before her as was possible from the conveniences at hand, till, overcome by weariness, her head bowed forward on the table and she slept. But it was only fitful naps, made hideous by dreams of unearthly terrors, and the morning found her but little refreshed and poorly prepared for the task before her.

There was earnest inquiry at breakfast for the cause of her strange conduct the previous evening, which she met with smiling explanations of the tediousness of shopping and the unaccustomed sights of the city; then, in her pleading way, asked leave to pass the day with a friend in the village, which was readily granted. Said farmer Edwards: "Yes! let her go, mother; she knows what she's about better than we can guess." And in due time she stepped from the farmer's sleigh at the place designated, and with a request to come for her early in the evening she entered the house, but remained only long enough to write a hasty note to be sent to her home at evening and then hurried to the depot.

It was nearly train time, and she could hear the distant rumble of its approach; it seemed as if her heart would flutter itself into fragments with mingled hope and fear. Summoning all her self-possession, she said to the ticket agent: "I want a ticket to New York, and please, sir, do not tell father Edwards where I have gone, until to-morrow."

Although it was a strange request, the official reluctantly gave the promise, and a few moments more found Marjie on the train whirling away toward the great city. Then such a feeling of utter desolation and loneliness came over her that she could scarcely suppress her tears; but she kept repeating to herself, "It's for his sake, poor Herbert, and I'll save him," and this thought seemed to renew her strength and courage. Hours rolled on, and faster sped the train, bringing her every instant nearer the final consummation of her daring scheme. What if she should be too late? God forbid it! The thought was maddening. The short gray twilight of winter had deepened into early night, and still on they flew. "An hour more, and we shall be in the city," remarked the man in the next seat. "In the city!" Marjie's heart gave a great bound. How much those three words meant to her!

A genial-looking old gentleman had for some time occupied the seat with Marjie, and as he opened his valise to receive some packages, she saw it was filled with Bibles, tracts, etc. Observing her inquiring look, he handed her a card, bearing the name "E. N. Soldier, City Missionary," saying, pleasantly, "You see I am a soldier, but these are the weapons of my warfare." Here was just what Marjie wanted,—a person whom she could trust to aid her, and without delay, she told him her mission was to save one who was near and dear to her, from a great crime; further than this, she refused to explain, and only asked his assistance to reach the locality she desired. "A very strange place for a lady to go alone, at night," said Mr. Soldier; but when he looked at her sweet, earnest face, and thought how far she had come on this journey of love, he could not believe evil of her, and before he had time to reason the case with her, the train had arrived in the depot at Jersey City. So taking Marjie's satchel, and bidding her cling close to his arm, they were soon jostling amidst the hurrying thousands of the great city.

What a Babel for Marjie's ears, so used to country quiet; but in a few moments something of her childhood nature seemed to come back to her, and as she remembered how she had roamed these very streets alone and unharmed in by-gone years, her tread was a trifle more firm, and she clung less closely to the arm of her protector. Marjie had requested to be left at the corner of Barclay and Washington streets, but it was plain the missionary had serious misgivings at the idea of deserting an inexperienced girl in that locality; but Marjie was firm, and bidding him "good evening," when that point was reached, with thanks for his kindness, she turned on Washington Street, and was soon out of sight.

A few steps brought her to the vicinity of the store, and by the light of the street lamp directly opposite, she plainly read the sign, "Elliott & Co., Wholesale Grocers," but the shutters were up and the doors all closed; for a moment she gazed at the place, with a blank stare, too confused to realize the situation; then her thoughts began to gather, but in an instant her mind was again a whirl of excitement. Was she too late? No; for she could inform the Police, and at least prevent the robbery; but this to her was a secondary consideration. Her aim was to save her lover from his temptation, and while she lingered in a vain attempt to form some plan of action, the door opened, and a porter appeared, broom in hand, finishing his day's toil by sweeping the pavement before the store. Marjie stood quiet in the shadow, and could scarcely be seen with her water-proof wrapper closely about her and the hood drawn over her head, and as the man reached the curb-stone, and stood for a moment, looking up and down the street, she slipped in the partly-open door, and had scarcely time to crouch behind a pile of boxes, when he returned, and hanging his broom in its place, gave a general glance around to see that all was right, then putting on his coat and hat, departed, closing the door with a heavy bang! and Marjie heard the bolt fly into its place as the key was turned, and, then his footsteps grew fainter, till lost in the distance; still she remained where she had first sank down, almost unconscious of her surroundings. She could hear the measured tread of the patrolman as he passed along the deserted street, then all was still as the grave.

Marjie was now within the warehouse doors, but with no definite plan of action; the promptings of a sudden impulse had brought her there, she scarcely knew how; the past seemed a dream and the future only chaos. She could only comprehend one thought, that was the necessity of immediate action, but what this action must be, her confused brain refused to dictate; sometimes a faint sense of the rashness of her actions would dawn on her mind, but was quickly overshadowed by the thought, "It is for Herbert's sake,—to save him."

At last, moving like one in a trance, she arose, and, supporting herself by the bales of goods which had concealed her, groped her way slowly toward the center of the store, till, in view of the office, where the gas was burning brightly; keeping in the shadow, she paused, to consider what to do next—but in vain she tried to think—her thoughts were in the wildest confusion; she could realize but one thing—that Herbert Elliott was in some great danger, which she had come to avert. She did not know whether he was near her then or not, but she believed that was to be the scene of his temptation, and moved by the vague impulse that she must save him, she again advanced toward the lighted office; a few steps showed her a man sitting at one of the desks with his head bowed forward perfectly motionless. She remained quiet a moment till he raised his head, and then saw it was Herbert Elliott, but how changed! The noble brow was contracted into painful wrinkles, and there was a look of bitterness and despair in his face—the hands of the clock over the desk, show it was nearly eleven, and its slow, even ticking seemed fearfully oppressive in the silence.

There was a rattling at the street door, which startled Elliott quickly to his feet, and then he smiled grimly at his own foolishness, for it was only the watchman on his usual rounds. "Only this, and nothing more."

A short distance in the rear of this office are two large doors, opening into a court or alley-way used for receiving and shipping goods; these were fastened by a stout, oaken bar placed transversely across them, and secured by a bolt; there was also a heavy spring-bolt at the top of the doors, and a double-lock near the bottom. At this entrance young Elliott glanced nervously, as the hands on the clock move slowly but surely around the dial nearing the fatal hour.

It is twenty minutes past eleven, and he piles up his books upon his desk, walks across the floor a few times, and then, carefully replies them, at least once in every minute of the quarter hour just past, and now examines the safe, leaving the door partially open. Eleven thirty! it is fearful to watch the varying expressions of his face, as with clenched fists he strides up and down that little room, as a caged lion treads his cramped prison-house, and anon drops his head forward and covers his face with his hands, while his whole form shakes with emotion. A glance at the dial shows eleven forty: with a wild groan he presses his hands to his temples, crying, "God, be merciful! Oh! God, be merciful!" What a moment for Marjie—trembling in every nerve, she is wholly undecided how to act—what *can* she do? It is a quarter of twelve, and again the latch of the door clicks at the the watchman's hand, and all is still; soon a faint tapping at the rear door brings Herbert to his feet with a bound. What a look! his eyes are blood-shot, and the purple veins stand out almost to bursting on his high forehead. He cries out, "Great Heaven! is there no help—no help for me?"

Marjie has crept close up to the door of the office, and can watch every motion.

He turns to his desk, and, taking up a small revolver, nervously draws back the hammer as if tempted to take his own life.

Marjie grows faint at the sight, her brain whirls, but she does not lose her self-possession for an instant; if he moves his hand to raise it, she will spring to him. Hark! the warning stroke of the clock—five minutes of twelve.

He hears it, drops the weapon and turning fiercely, almost brushing against Marjie in his haste, passes out of the office toward the doors he loosens the heavy bar and, takes it down, then walks back a few steps—one minute gone—he leans his head on a bale of goods for an instant, then slowly taking up the bar, partly replaces it. Oh! what a moment of anxiety for Marjie: will he have courage to be true? "God help my Herbert," she murmured. But with a fiendish laugh he throws it down again, the clock is on the stroke of twelve, a moment more it will be done and Herbert Elliott will be a felon. Oh! the wild passion that surges through Marjie's heart, her reason wavers, it seems to her that the canopy of heaven is about to fall, and her slender hand is all that holds it back, and now she thinks an awful tempest is to devastate, the earth and the winds are held in her feeble grasp, which she feels is weakening at every breath, the mental strain is too much for human endurance, it grows dark to her, and she cannot speak or move; but her eye is fixed on Herbert and she watches every motion of his hands. He has pulled down the spring-bolt from the top, one turn of his hand will complete the work. He staggers forward and looks wildly around him—his hand is on the key, and—Marjie is spell-bound, will she fail now at this last moment? has she fainted? not a feature moves—her face is livid and her eyes protruding; the clock begins to strike and Marjie moves, she takes a step nearer and at the rustle of her garments Herbert looks around. There she stands, full in the gas-light pale and motionless.

"Oh God! 'tis Marjie's spirit!" he cried, and reeled heavily clutching the door for support. The clock is striking and there is a loud tapping at the door. With a strong convulsive thrust he acts the spring bolt back in its socket, the oaken bar is quickly replaced and secured; then sinking on his knees, Herbert Elliott vowed for Marjie's sake to be *a man*.

There is impatient rapping at the door, but heeding it not he turned again toward Marjie and there she stood unmoved, the shock was almost too much for even his strong nerves, but he spoke calmly—the calmness of fear—saying:

"Is it you Marjie, or am I mad?" and with equal calmness she replied.

"Yes, Herbert, it's your Marjie come to save you."

"And, God be praised, she has saved me," cried he as, catching her fainting form, they both sank to the floor.

The noise at the door grows louder, but they hear it not till brought to consciousness by the sharp report of fire-arms and the rush of feet without.

The cause of this is readily explained by the action of Mr. Soldier, who, after leaving Marjie, met a friendly officer to whom he related what he knew of these strange circumstances. A special watch was placed in the vicinity and the three burglars were taken in the act of signaling to Herbert Elliott.

Their story of his connection with the plot was not believed, and as they were well known to the police as criminals, the proof was deemed sufficient for their conviction.

Thus, by the blessing of God on the intrepid daring of a simple country maiden, the fortunes of the house and the honor of Herbert Elliott were saved.

It is not for us to describe the confessions made, vows renewed, or prayers of thankfulness that rose from earnest hearts as the night hours waned; but we will mention that in the early dawn of that Christmas morning a carriage was driven from a dingy warehouse on Washington Street to a spacious residence on Madison Avenue, and a strange scene was witnessed in the library, where were present only Gilbert Elliott and wife, his son and Margaret Martyn,—and, strangest of all, this same austere Gilbert Elliott found tear-drops on his cheeks, where none had been for forty years before, and as he wiped them off he laid his hand tenderly on a maiden's head, saying, "God bless you! God bless you, my daughter!" A week later, when the New Year dawned, the sign at No. — Washington Street read no longer "Elliott & Co.," but "Gilbert Elliott & Son."

Mother Edwards had company from New York on Christmas week, and there was a long, earnest consultation in the quaint old keeping-room the night before they returned. When the daisies came and the strawberries began to ripen in the meadows, one daisy blossomed from girlhood into womanhood, and the accompanying strawberries were rosy blushes beneath a crown of orange blossoms.

MONKEY COOLIES.—A correspondent of a Ceylon newspaper states that large apes are now regularly employed in the Straits Settlements to pull cocoa-nuts. These monkeys are imported from Acheen in batches, like coolies, and are marched round the plantations by their owners, who let them out on hire. A line is first attached to each of these peculiar laborers, and he is then sent up a tree, where he is said to select fruit with great discrimination, and to twist the nut round and round until it falls to the ground. Each successive fall of a nut is hailed by the hairy operator above with a jump and a chuckle of satisfaction.

THE CONTENTS OF A CROCODILE'S STOMACH.—The stomach contained about five pounds' weight of pebbles, as though it had fed upon flesh resting upon a gravel bank, and had swallowed the pebbles that had adhered. Mixed with the pebbles was a greenish slimy matter that appeared woolly. In the midst of this were three undeniable witnesses that convicted the crocodile of wilful murder. A necklace and two armlets, such as are worn by the negro girls, were taken from the stomach. The girl has been digested. This was an old malefactor that was a good riddance.—Sir Samuel Baker's *Ismailia*.

RECENT LITERATURE.

Dosia. By HENRY GREVILLE. Translated by MARY NEAL SHERWOOD. Boston: Estes & Lauriat. Price, $1.50.

THIS is a charming story charmingly told, and felicitously translated. Dosia is a fresh, original creation, quite too good for the somewhat priggish fellow who won her. While the plot is extremely simple,—it can scarcely be called a plot, in fact,—the dialogue is sparkling, and the narrative is as smooth and graceful as a sun-beam. The story is so unlike the average French production, is so unlike some other stories by the same author, as to create a curious surprise that her pen could produce such dissimilar work. The book must prove a delight to those fortunate enough to read it.

The Cob-web series, to which it is the latest addition, has been very happy in its selections of foreign authors thus far, and if the standard is adhered to, we do not think we can recommend more pleasing translations to those whose scheme of education has not embraced foreign languages.

BRIC-A-BRAC.

IMITATION EBONY.—Ebonized wood is much in demand now-a-days for painted panels and other decorative purposes. In some respects it is preferable to the genuine ebony. Apple, pear, and walnut wood, especially if fine-grained, may be "ebonized" by the following process: Boil in a glazed vessel, with water, four ounces of gall-nuts, one ounce of logwood chips, half an ounce of vitriol, and half an ounce of crystalized verdigris; filter while warm, and brush the wood with the hot solution a number of times. The wood, thus stained black, is then to be coated two or three times (being allowed to dry completely after each coating) with a solution of iron filings in a quart of good wine vinegar. This is to be prepared hot and allowed to cool before use.

ONLY a boy; but he chanced to crawl,
Through a little rent of the circus wall,
And, taking breath, he stood bravely up
Till the clown came in with skip and hop.

Only a boot; but it chanced that day
That that there boot it bore down that way,
And the power that through that boot was sent,
Lifted the boy out of that circus tent.

[*Good Words.*

APPARATUS costing $2,000 has been successfully used in San Francisco to photograph a horse while trotting. A row of cameras was uncovered and covered by electricity, thus photographing the famous horse at successive points of his stride while going at a 2:25 gait. These pictures show that his feet were all off the ground together twice during the stride, notwithstanding the general belief of turfmen that a trotting horse always has one foot down while in action. They also upset accepted theories as to the shape of the fore leg when the foot touches the ground, for Occident is shown with the leg projecting at a considerable angle before him, as straight as an iron bar, with the heel in contact with the surface, and the toe not yet brought down.

"THERE goes a maiden wooed and won,"
Said Robinson to Brown.
As by there passed a dainty dame
With richly broidered gown;
"And there," said Brown to Robinson, with finger placed
A painted form upon
That fronted a tobacco mart,
"There stands a wooden one." [*Yonkers Gazette.*

ENTERPRISE IN HONEY.—A Chicago honey dealer has constructed a floating bee-house large enough to accommodate two thousand hives. This he is towing up the Mississippi River, from Louisiana to Minnesota, keeping pace with the blossoming of the flowers, thus stimulating the honey-making ability of his bees. In his return trip he designs to take advantage of the autumnal flowers at each point, just as he does of spring in going up the river. This plan of moving bees to get the benefit of fresh flowers has been tried in some parts of Europe.

HEAVEN'S PHONOGRAPH.

"For every idle word that man shall speak,"
For every low-breathed curse his lips shall mutter,
I've always read that man shall give account
At the last day, to his confusion utter.

Scoffers have sneer'd, "What, every word recorded
Nothing illegible on pages of gold?"
Earth has its phonograph—is heaven without it!
Scoffer, beware! the phonograph is old.

[*F. H. in Boston Advertiser.*

AN INN IN JAPAN.

THE certainty of having a pleasant resting-place after the toil and trouble of the day is one of the charms of pedestrianism in Japan. The "Pied Bulls" and "Red Lions" of our English highways make no pretence whatever to anything beyond the mere satisfying of the animal wants. How very different it is in Japan! From the moment the threshold is crossed to the moment of departure the visitor is the object of unceasing solicitude on the part of every one connected with the establishment, from highest to lowest. If it is midday, and he has arrived hot, dusty and a little tired, after a long morning's tramp, the whole force of the establishment ushers the visitor into a pretty, light apartment, looking on to one of those marvelious miniature gardens, in which, covering a space of a few feet, the mountains, woods, rivers and floods of an entire province are represented. By one neatly-dressed, pleasant-looking damsel his boots are taken off and his feet bathed in hot water, a second fans him and keeps up a voluble patter of conversation, a third on her knees offers him refreshing tea and sweetmeats, while the host himself with another detachment of waitresses if helping the coolies to unpack the box containing the European food. Everything that meets the eye is contrived to please it. There are pleasant rustic paintings the screens. There are vases with flowers dotted about; from the woodwork outside are suspended gayly colored lanterns, or festoons of glass through which the wind makes a soothing music, so that by the time the traveler has finished his repast, has smoked a pipe, and perhaps drank a cup of "Saki" with the host, he feels thoroughly refreshed and in capital humor to resume his journey. All this enjoyment is procured at a merely nominal cost, and the present of some bread or European liquor to the house at leaving brings out the whole establishment, who say "Sayonara"—that is "Good-bye"—with their foreheads on the mats.—*Belgravia.*

BLUE eyes smile and sorrow dies,
Blue eyes frown and gladness flies;
Smiling, frowning, laughing, weeping,
Blue eyes o'er my heart are keeping. DE.

"You may break, you may shatter the vase, if you will," but the frightful keramics pasted on by women folks will stick to it still.—[*Norristown Herald.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE

THE WAY IT IS DONE.

MRS. A. E. STORY.

When we consider that, given the requisite knowledge, it is as easy to make good butter as poor, providing one is willing to take the needful pains, it becomes a marvel why there should be so much of an inferior quality produced. Plenty of water for the cows not simply night and morning, but so provided that they might have access to it at all times, and a cool airy room for the milk, are the first requisites, and without them it is next to impossible to have good butter.

Western butter, apart from the "creamery," takes a low rank in the Eastern markets, and judging of what is sent out by the other Western States, from what we know of what goes, and *how* it goes, from Michigan, it is not to be wondered at. At present butter brings ten cents per pound in Lansing, and is correspondingly low all over the State, not excepting in Detroit. One would think this price would cause makers to hold on to it; but, in the main, it does not. Butter is at present a drug in the market, the East having a tendency to keep it so.

Every grocer has constituted himself a shipper on a small or large scale, as the case may be, and oh! to see the way in which the butter is "put down" by the clerks. Good, bad and indifferent jumbled together in oily stickings! The golden rolls sent in by some one who knows how butter should be made, go into the firkin along with a lot of greasy-looking stuff out of which the buttermilk oozes unctiously as it is ladled and pressed down.

When the supply throughout the State only about equals the local demand, grocers respect the palates of their customers, in so far at least as to *look* at the butter they take in, but when once the packing season begins, there is an end of this. The butter comes in crocks, pails, pans and various nondescript utensils and generally is not so much as uncovered till it is ready to be weighed out and paid for. Then if a lot is found to be particularly fine, it is put aside for the home trade and the rest is squashed into the firkin, headed up and sent off to be eaten by whomsoever has a taste for it.

It ought to be a shame for a great State like Michigan, that any product of her soil should go forth to bring her discredit. It is not the grocers who are most to blame in this matter, though it would seem that a little care bestowed in purchasing, rejecting such as is manifestly unfit for the table, and properly assorting the lots so as to produce a uniformity in the contents of each firkin, would have a beneficial result, not only as yielding larger returns, but as having a tendency to work a change in the quality of the butter offered; for pride will do sometimes what nothing else will, and the housewife must be sadly lacking in pride who would be content to have her butter of an inferior grade when its inferiority is likely to be noticed, and its value weakened in consequence. But the main trouble lies with the farmers themselves, and instead of complaining of the prices they receive, they should seek the remedy in packing their own butter and holding it till the state of the market will warrant its shipment. This is already done by many farmers, and especially by such as have come to look upon the butter product of their farms as something more than an offset against their grocers' bills. But with too many there seems to be a disposition to be satisfied if the family cow supplies the family tea-pot and sugar-box.

This feeling as to the *littleness* of what might be made a source of wealth, is destined to undergo a change. Even now, in many portions of the State, grain-raising is—though to a limited extent—giving place to stock-raising and dairying. Michigan—many parts of it at least—is as well adapted to the latter, as it has long been known to be to the former. This the reports of the various cheese-factories and creameries scattered through the State fully show.

Clinton Co., Mich., June, 1878.

TO CAN GREEN PEAS.

Seeing an inquiry for a successful method for canning green peas, I append the following experience, knowing if the directions be strictly followed, that success will infallibly be the reward. Never attempt to can peas in glass or earthenware, as all efforts in that line, so far as I have knowledge, have proven unsuccessful. One should provide himself with *strong*, new tin cans, and the necessary conveniences for soldering. Another important feature is that the peas should be fresh from the vines, and cooked as soon as shelled. Boil the peas in water sufficient to cover, for ten or twelve minutes, seasoning with a little salt. Then fill the cans two-thirds full of peas, adding enough of the liquor in which they were boiled to fill to the brim. Wipe the groove dry, put on the cap, and solder air-tight at once. Make a small puncture in the center of the top, and place the cans in a boiler of hot water, to boil for an hour and a half. It is best to have something at the bottom of the boiler—broken crockery, wooden slats, in fact anything to keep the cans off from the bottom. Now, take the cans from out the boiling water, one at a time, and open the puncture with a needle, to allow of the escape of gas and steam. Then solder it tightly, and return to the boiler to boil two hours longer—even three will do no harm. If, at the expiration of this heroic treatment, the cans are still air-tight one need have little fear of fermentation of their contents.

Mary B.

BAKED PORK AND BEANS.

It may be granted that there is not a cook that does not "know beans;" but that there are many who do not know how to cook them properly, is a positive fact. Now, I will give you mother's way which I have never known to be excelled, but if there is a better way I should be pleased to know it. Three hours before dinner-time put on a nice piece of salt pork to boil, and about the same time put the beans to cook in another kettle, with much more water than enough to cover them; stand on the back of the stove at first so that they will swell nicely before boiling. When they have boiled about twenty minutes drain off the water and put on more, which should be boiling at the time. When they are very tender and begin to break, dip enough salt water from the pork to season them. If the pork is not yet tender, set the beans on the back part of the stove, for they will burn very easily after they begin to break. When the pork is boiled enough—it will generally be tender in about two hours—take the beans out into a dripping-pan and place the pork in the center; cut through the rind where it is to be sliced, and sprinkle black pepper over the whole. The beans must be quite juicy when put in the oven or they will be very dry when baked. A spoonful or two of molasses in half a cup of water, spread over before baking, make them brown nicely and also give them a good flavor. We usually boil the potatoes for dinner in the water the pork was boiled in, taking care to reduce it if too salt.

Mrs. S. C.

Wayne Co., N. Y.

DOMESTIC RECIPES.

Greens

Many people are too fastidious to eat greens, but let such remember: "Better is a dinner of herbs where love is, than a stalled ox, and hatred therewith." Mixed greens are far nicer than all of one kind. One-third horse-radish leaves and two-thirds narrow-dock—yellow rooted—make an appetizing dish, while beet leaves and mustard are far better mixed than either alone. All greens should be thoroughly looked over and cleansed from any impurities. Put them into boiling, salt water, and boil until tender, which will be in about one half-hour, although the narrow-dock will be tender in ten minutes' time. Drain, and press out all the water, mix in a lump of butter, smooth off, cut in squares and send to the table hot.

Rose Leaves.

These are nice to put in cake. Gather as many as wished, chop fine, mix in a little white sugar, spread on plates and dry. When perfectly dry, pack in cans and keep air-tight.

D. W. J.

Corn Pone.

Will some of the Rural housewives give a recipe for making and baking the old-fashioned corn pone? Can said pone be baked in the usual baking pans of the stoves of the present day?

W. E. L.

To Pickle Black-Walnuts.

Gather the nuts before the shells are hard, which may be known by piercing them with a pin, and let them soak in strong salt and water for one week, stirring them every day, and changing the water every other day. At the expiration of a week let them drain and remain in the open air until they turn black. Prepare some good cider vinegar, and to each quart allow one-fourth of an ounce each of cloves, black pepper, ginger, mace, Jamaica pepper and an ounce of salt. Bring to the boiling point and pour over the walnuts. When cold, turn off and again heat, pouring it over as before. Tie down with a bladder and let stand three months. If then they are to be kept any length of time, it is best to prepare fresh vinegar, with the same proportions of spice and salt; boil five or ten minutes and pour hot over the nuts.

Pickled Chicken.

Boil three chickens until the meat will fall from the bones; remove the meat as whole as possible and put into a stone jar; add to a pint of the water in which they were boiled enough vinegar to cover the meat; season with cloves, allspice, pepper and salt and pour hot over the chicken.

Clam Stew.

Wash fifty hard-shell clams clean and put in a kettle with a half pint of hot water; let them simmer and steam until the shells open; then take out of the shells, strain the juice and return to the fire with the clams; add half a pint of rich sweet milk; a piece of butter, pepper, and salt if necessary. Roll three crackers fine and add just before serving.

E. M.

News of the Week.

POLITICAL.

Monday, July 22.

The main body of the Potter investigating committee has happily given itself and the public a rest during the sweltering week just ended, but it will begin its labors again to-morrow at Atlantic City. There the "visiting statesmen" will tell as little as they can about how the electoral count was manipulated in Florida and Louisiana, while several other notabilities will add to the mass of information, contradiction, or perjury already accumulated. It is supposed that the committee will, by its presence, advertise Atlantic City as a pleasant sea resort, at least for the next fortnight. The labors of the sub-committee in New Orleans have been but poorly rewarded by the evidence taken during the week. The Secretary of the Louisiana democratic committee swore that J. E. Anderson tried to sell himself to them, but couldn't there find a market; while a number of colored witnesses testified that E. L. Weber endeavored to bribe them to perjury in support of some of his yarns. Judging by his own venality and that of the general run of Louisiana politicians, either he must have offered a ridiculously small price; or they took his money without working for it; or they have been better paid by the other side; or he never made an offer to them, and they are falsely boasting of having resisted temptation—or, well, anything except the supposition that a Louisiana politician was not purchasable.

Among the political parties of the day is a quiet organization known as the Farmers' Alliance, which, originating in Herkimer County, in this State, has already extended to Oneida, Jefferson and Lewis counties, and will soon spread widely abroad. If praiseworthy objects are as favorable to the growth of a political party as those of an indifferent, doubtful or demagogical nature. The reduction of official salaries and public expenditures generally; the election to the legislature of fewer lawyers and more farmers; and the relief of real property from the undue proportion of public burdens which now press upon it, are the chief objects which the Alliance proposes to accomplish. It has no affiliation with the Nationalists, though it may unite with them for common ends; but it is hardly likely that any close union can take place between those who proclaim war against the reaper, mower and threshing machine, and those to whom these implements are a god-send, who have a vital interest in making their ownership of the soil by these means profitable, and to whom the best government is that which rules most cheaply, justly and equitably, giving to each class the weight its numbers and importance merit. It is certainly time that the farming community took a more prominent part in politics, not merely as followers of the old parties, which prize them only for their votes; but as special advocates and representatives of the grandest, most permanent, and most virtuous branch of industry in this or any other country.

The Nationalists of this State will hold a convention at Syracuse to-morrow, and from present indications it's going to be by no means a "happy family," as there probably will be a desperate struggle for the leadership between the various factions of which the new party is composed. The Greenbackers want unlimited money; the Labor Reformers want limited hours of labor, higher wages, and no convict competition; the Communists desire that everyone should contribute according to his ability to the happiness of everyone according to his needs; and moreover, there is a multitude of sub-divisions of each of these factions, the leaders and ruck of which have their own particular axes to grind. Energy, however, is certainly not lacking to the organization, as investigation shows that its members are working vigorously, though secretly, and there is little doubt but that, at the next election, it will display considerably greater strength than the general public has hitherto thought possible. It would be well if the Farmers' Alliance manifested only a tithe of such vigor; but then, farmers have little time for idling, and their dispersion through the country renders it more difficult for them to meet and agitate, while the Nationalists are confined almost entirely to the idlers and workmen hived in cities, and ever ready to push at all risks what they consider their own interests.

Gen. Merritt, the new Collector of this port, has filed a bond for $400,000, and entered on his duties last Saturday. Hayes, it is said, intends to make war on those republicans who, like Conkling, are neither admirers nor supporters of his; consequently, he has removed the Postmaster at New Orleans, whose only offense consists in his being a brother-in-law of Gen. Butler, and ex-Chief of Police, Gen. Badger, has been appointed in his stead. Another effort at crossing the "bloody chasm" is about to be made at Marietta, Ohio, where preparations are under way for a grand re-union of "the blue and "the gray," next September. It is expected that 40,000 Union and Confederate veterans can be induced to meet there, besides a batallion of British regulars from Canada, come probably to see how a "bloody chasm" is bridged. The President and his cabinet, together with Sherman, Beauregard, Sheridan, Joseph E. Johnston and many State Governors, will be on show. Despite the scortcomings of the late Louisiana legislature, the people of New Orleans are jubilant over their prospects. The revenue of the city has been greater this year than any year since the war; the crops are excellent; the mouth of the Mississippi has been deepened enough to allow the passage of large European vessels; the grain trade of the upper part of the great valley is tending more and more, like the cotton trade of its lower part, to seek a cheap water outlet southward; and, altogether, there is a fair prospect of brighter days for that tax-ridden, swamp-begirt, late sink of political corruption—the Crescent City.

MISCELLANEOUS.

Jas. Gordon Bennett, of the Herald, who has been in Europe since his duel with May, returned in a lordly way last Tuesday. He and his sister and their six servants had 125 pieces of luggage—more than all the other passengers together. The vessel which he has purchased for the purpose of discovering the North Pole, and called the Jeanette after his sister, is on her way from Havre to San Francisco. There she will be fully equipped, and go polewards by way of Behring Straits, which has been selected as the most practicable route. During June $5,120,868 were received by the Government for public lands in Dakota, Kansas, Minnesota and Nebraska, an increase of $3,724,527 over the same month last year. This indicates a large prospective addition to the number of our farmers and stockmen—good for the country at large, whose prosperity mainly rests upon agriculture, but not so good for the farmers whose products are already almost too abundant to meet with a profitable market. Mr. Dodge, Statistician of the Department of Agriculture since its foundation, eighteen years ago, has resigned, "as a protest against the incompetency and recklessness" of his superiors. His protest is a trifle vague, to be sure, but his services have always been excellent, and by his withdrawal the public has lost an efficient servant, and the farmers of the country a valuable friend. At Owasco Lake on Wednesday, the Cornell Freshmen won a well-contested boat race against the Freshmen of Harvard University. Judging by the relative *eclat* gained by the various forms of competition in our Universities, it would seem that the main object of these institutions is to train their alumni in muscular Christianity.

The heat during the past week has been unprecedentedly severe in some parts of the country—notably in St. Louis, the hottest city in the United States in summer time. On Monday last, the number of deaths in that city from sunstroke and prostration due to the heat, amounted to forty adults, while upwards of one hundred non-fatal cases occurred. Twenty-five dead bodies, just brought in, lay at the Morgue at one time; and the fatality was exceptionally great among infants and children, not here enumerated. On Wednesday the thermometer rose up to 103 in the shade, and from seven o'clock in the morning patients began to arrive at the public medical institutions and at the Morgue. All out-door business was suspended. Fourteen of the staff of four newspapers were prostrated as well as five policemen, six letter-carriers, and a large number of citizens. In most of the Western States the weather was torrid, work in the heat of the sun generally suspended, and suffering caused to men and animals, and not a few deaths. By Thursday the hot wave had reached the Atlantic sea-board, and there were 123 sunstrokes in this city, and 48 deaths, while in all the neighboring cities from Boston to Philadelphia, the heat was also intense, the thermometer in the Quaker City registering 101. Harvesting everywhere has been considerably delayed by this tropical spell, the like of which only those upwards of a century old could faintly remember as happening in their infancy. No longer, however, does sweating and limp humanity pant for a breath of air, or stifle with that from the mouth of a glowing furnace; for yesterday and this morning the air has been delightfully cool and invigorating, and, moreover, there's a very great deal of it.

FOREIGN.

Across the Atlantic the treaty of Berlin and its consequences still form the chief topic of interest. Last week the terms agreed upon with regard to the settlement of European Turkey were here epitomized; and later advices show that the adjustment of Asiatic Turkey had already been anticipated. Kars, Erzeroum, and Batoum, together with the intervening section of Armenia, become Rusian property; while Bayazid, just at the foot of Mount Ararat, which Russia had set apart as a sop for Persia, has been retained among the Turkish possessions. About two-thirds of the Ottoman European territory still remains to the Porte, and this is the richest, most thickly populated, and most peaceful part of it. Late statistics of the population of European Turkey show the races therein approximately divided into 2,200,000 Osmanlis or Turks proper; 1,000,000 Greeks; 3,550,000 Solavs—half Bulgarians and half Serbs;—1,200,00 Albanians, together with a varying number of Armenians, Roumans, Gypsies, Jews and Tartars, making altogether about 9,000,000 souls. Of these 6,000,000 are still included in the Turkish Empire; while of the 14,000,000 population in Asiatic Turkey, scarcely a million have been transferred to Russia, so that in the words of Bismarck, "Turkey is once more a European Power."

In the Berlin instrument nothing has been said about the money indemnity imposed upon Turkey by the treaty of San Stefano, so that this question remains to be settled by the two parties at some future day, and may be made a cause of later bickering and battle, should Russia feel so disposed. At present, however, the Colossus of the North seems utterly exhausted. The late war cost the Czar upwards of $700,000,000 and 95,000 lives. His treasury is exhausted; his credit a thing of the past; his subjects generally discontented at the results of their heavy sacrifices, while unable, with a bankrupt exchequer, to renew the struggle. While the Muscovite bureaucracy, from the highest to the lowest, are corrupt and dishonest beyond comparison, throughout the Empire there is a growing feeling of discontent at the present government, manifested most openly by

the Nihilists, whose destructive principles were lately condensed here. The Czar accordingly will probably have his hands full of business for some time, in managing the internal affairs of his vast possessions, without intermeddling with Turkey, even to secure a little of the money much needed in his depleted coffers. This, however, would be impossible without depriving other creditors of the Porte of all chance of getting what is due them. Even away back in 1874 the floating debt of Turkey, which was secured simply by public credit, amounted to $64,600,000; while that due to foreigners, secured on special sources of revenue—a security far safer than Turkish public faith—ran away up to $772,000; while official reports in the following year put the entire Turkish debt at $969,600,000, with the outlay constantly growing larger than the income. Most—fully two-thirds—of this debt was due to British subjects; hence not a little of the anxiety felt by the British capitalist at the recent prospect of the death of the "sick man" who owed him so large a bill, all hope of any payment on which would end with the turbaned invalid's life. This debt—enormous for such a semi-civilized nation as Turkey—has since then been greatly increased, so that there is little prospect of Russia ever getting any money indemnity, and she has disclaimed all idea of exacting a territorial substitute.

Austria is about to occupy her slice of Turkey with 70,000 men. It was thought at first that the inhabitants of Bosnia and Herzegovina would resist the invasion of their territory; and the Austrian army of occupation would then have amounted to 140,000; but in view of the more peaceable disposition lately manifested, the army has been reduced one-half. For ages bloodshed and constant robbery and discord have kept these provinces desolate, and it will ultimately be fortunate for the inhabitants that the strong arm of the Hapsburg will make peace among them. Doubtless the presence of Austria here will also be a check upon the pro-Russian tendencies of Servia and Montenegro, as well as a restraint upon Muscovite machinations in that neighborhood.

The chief talk, however, is about the British treaty with Turkey, which caps the feat which Bismarck calls "a great triumph of British diplomacy." By this treaty England has already taken possession of the Island of Cyprus, the third largest island in the Mediterranean Sea. Its greatest length is 145 miles, its greatest breadth 60; it is 45 miles only from the coast of Syria; 250 from the entrance to the Suez Canal; and about 1,000 miles east of the nearest British possession, the Island of Malta. It can be made a second Gibraltar; gives England a masterly position in the Levant, within easy reach of Constantinople and Egypt; and at the same time offers her command of the valley of the Euphrates.

Along this British capital is about to build a railroad to the Persian Gulf, thus opening up the great natural riches of parts of the country, and affording another road to India. True it is that the responsibility England has undertaken, to defend Asiatic Turkey against all aggression, is by no means a light one; but it will lie most heavily on future years, and then it can be abandoned whenever it becomes inconvenient, or at least dangerous, and this with no more deceit and lack of good faith than have been displayed in undertaking it. HERMAN.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 20, 1878.

BEANS AND PEAS.—Medium beans are quiet, and a rather free offering makes prices easier. Marrows of prime shipping quality are not over plenty, and prices are quoted firmer. Extra pea beans have a fair demand. Other marks or remnants neglected. White kidneys dull. Choice red kidneys held higher. The weather has been severe upon stock in store, and about all wholesale trade is transacted at the stations. Canadian peas have advanced; 77@78c. in bulk and bond. Green peas also better, at $1.15@1.20; Southern B. E. nominal, at $3@3.25.

We quote medium beans, prime, $1 55@1 57½; fair to good, $1 35@1 50; marrows, prime, free on board ship, fair to good, $1 57½@1 60; Peas, $1 40@1 65; white $1 60@$1 62½; kidney, $1 40@1 60; red do., $3@3 25; black, $2 35@2 40; Limas, $3 75@4 25.

Receipts of beans, 2,868 bush.; exports, 1,315 bbl.
Exports of peas, 39,031 bu.

BUTTER.—Uninterrupted hot weather has distracted much of the ordinary demand. The quality of State has fallen off, and buyers are frequently compelled to trust to the reputation of marks in both State and western, and indeed, sometimes have waited for the arrival of specials rather than risk lots on sale. This shows the value of establishing a respectable mark. Firkins have sold well. The general stock is kept from accumulating by the export demand; shippers now have increased cold room on steamers. Late sales for Europe have included a wider range of qualities, but fine stock is still receiving surest attention. It is becoming quite a custom here to turn old-fashioned cellars into cold storage. Western, when it arrives right, holds up nicely by the system, and exporters are looking at it more frequently than before; while its easy quotations have called off a number of Eastern buyers from Welsh tubs.

State creamery, choice, 20@21c.; other, 18@20c.; half tubs and pails, choice, 14@16c.; other, 11@14c.; Welsh tubs, best, 12@13c.; other, 10@12c.; poor State, 6@8c.; State firkins, 15@17c.; Western creamery, choice, 20c.; other, 16@19c.; Western dairy, best, 13@14c.; other, 9@12c.; factory (ladle packed), 9½@10c.; other, 6½@8c.; milled Western, 5½@8c.; old and grease, 3½@5c.

Receipts for the week, 30,160 pkgs.; exports past week, 12,675 do.

BEESWAX.—A small trade is in progress at 26½@27½c. for Western and Southern.

BROOM CORN.—There is the quiet trade usual approaching a new crop. Latest prices are 6@6½c. for hurl and short brush; 5@6c. for medium green, and 4@4½c. for red and red tipped per lb.

CHEESE.—Early in the week the market stood up well under the unprecedented arrivals, reaching nearly 60,000 boxes in one day, and indeed on some of the fancy colored lots better prices were possible, the weather then being cool, and the position abroad as well favorable to shippers; 8¼ was made for the choicest, but at the close of the week the life has been taken out of the market; there is found to be a liberal accommodation, and the turn to hot weather discourages exporters. The closing market is 8¼ for fancy-colored, but white and lower grades are very much depressed, and have scarcely a fixed value

Quotations are for fancy, 8@8½c.; 7@7¾c. for good and prime; 6½@7c. for fair; 4@6c. for half skimmed; 2¼@3½c. for skimmed. State, farm dairy at 6½@7½c. for good to choice, 5@6½c. for fair to good, and 2@3c. for poor skimmed. Wisconsin factory, fine to fancy, 7½@8c.; do. good to prime, 6¾@7¾c.; do. fair to good, 6@6¾c.; Western factory, fine, full cream, cheddar, 7@7¼c.; do. fine, full cream, flat, 6¾@7¼c.; do. slightly skimmed, flat, 6@6¾c.; do. half skimmed, 4@5¼c.; do. full skimmed, 2@3c.

Liverpool cable, 44s.
Exports past week, 125,478 boxes.
Receipts, 150,512 boxes.
Gold closes, 100¼.

COTTON.—There is a much better spinning demand, and the general market is stronger. Latest prices are for July, 11.61c.; for August, 11.63@11.64c.; for September 11.23@11.29c.; for October, 11.14@11.15c.; for November, 10.99@11.00c.; for December, 10 99c. for January, 11.03@11.04c.; for February, 11.08@11.09c.; for March, 11.18@11.18c.; for April, 11.25@11.26c. and for May, 11.31@11.32c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

Good ordinary 9¾; Strict good ordinary 10
Low middling 10¼; Middling 11 1-16

DRIED FRUITS.—There is a generally slack market, and prices wholly nominal.

Peaches—Fancy North Carolina at 10@11c.; good to prime Georgia at 8@9c.; unpeeled halves, 3¼@3¾c.; quarters, 3¼@3¾c. Pitted cherries, nominally 13½@14c; raspberries, 26c.; New York State plums, 12@12½c.; southern plums, nominal; blackberries nominal. Apples—State quarters, 3½@4c.; do. sliced, prime, 4½c; good, 3¼@4c; western quarters, 2@3c.; southern at 4@4¼ for prime sliced; 3@3½c. for fair to good; southern quarters, 2@3c.; Tennessee quarters, in bags, at 1¾@2c. New raspberries, 26c.

Exports—419 bbls. dried apples.

EGGS.—Receipts for the week, 7,107 bbls. The market has ruled somewhat firmer, but with the extremely hot weather trade drags, and prices are a shade off from a day or two ago. The receipts of fresh have mostly gone off, but there is quite a supply of cold stored lots. Sellers do not draw largely from these, as they must soon sell after leaving a low temperature.

Near points scarce, quoted, 14@15c.; State and N. J. 13@14c.; Western, fresh, 11½@12c.; Canadian do. 12@12½c.; other, 10@11½c.

FRESH FRUITS.—There is a large supply of apples, quality very good for date, and prices easy. Sweet and sour brought $1.50 2.00; Astrachan, small to prime, $1.25@3; small and windfalls, 75c.@$1.25 bbl., all open heads. Peaches have been scarce most of the week, and a very steady demand has kept prices strong. Georgia and S. C., $3@5. crate; N. C. $1.50@4.; Md. "Hales," $1@1.75; do. "Troths," $2.50@3. The first installment from California orchards arrived this week—a car-load, mostly Bartlett and Doyenne Pears. Pears, $5 box. Fine plums, $3 do. Jargonelle pears, $3@4 bbl.; Harvest do., $2@2.75; Whortleberries, $2@2.50 bush. Raspberries are low; Antwerps, 2½@1½c. third quarts. Brandywine, 3@5c., pint. This latter berry is growing in favor, as it has some shipping hardness and gives almost as much satisfaction as Antwerps in flavor. Currants cheap; small, 3@4c.; Cherry, 6@10c.; Black, 4@5c. Watermelons have begun to sell; market well supplied. Char., $30@40 per 100; Augusta, $30@45; N. C., $15@30; Nutmeg melons, Norfolk, $2.50@3.50 bbl. Black Hamburg, 50@75c. lb.; Muscat 50@75c.; Sweet Water, 40c. Peanuts quiet, at $1.55 for extra hand-picked; $1.40@1.45 for choice, and $1.25@1.35 for good.

FLOUR.—The hot weather has interfered with trade. Good lots that will hold well, not likely to be affected by the heat have sold higher, but otherwise buyers have had the advantage.

Latest prices are $3.35@3.90 for very inferior to very choice superfine State; $3.90@4.20 for poor to very good extra do. odd lots and lines; $4.20@4.55 for good to fancy do.; $3.35@3.90 for very poor to very choice superfine Indiana, Iowa, Michigan, Ohio, &c., $3.90@4.20 for inferior to good shipping extra do. and $4 30@4.55 for good to very choice extra do.; common to about choice white wheat extras, $4.30@5.40; choice to very fancy do. at $5.50@6.50; red and amber winter wheat, inferior to very choice trade and family at $4.15@5.75; round hoop Ohio at $4.00@$4.30, and trade and family brands of do. at $4.35@$5.75, the latter rate for choice, (very choice to fancy lots quoted higher); St. Louis, $4.25@5.00 for very poor to good extra, and $5.00@6.25 for good to very fancy; Minnesota clear, very inferior to very choice at $4.20@5.65; Minnesota "straight," inferior to fancy, at $5.00@6.75, few genuine brands of this class going under $5.40@5.50, and patent poor to strictly fancy at $5.40@8.25; unsound stock at from $2.00@5.25; city mill extra at $5 00@5.20 for West Indies, do. for England, $3.90@4.10; do. trade and family extras, $5.05@6.75; do. for South America, $5.25@5 85 for fair to fancy; No. 2 $2.25@3.25 for inferior to fancy.

CORN MEAL.—Is selling at $2.85@3.90 for Brandywine, and $2.10@2.35 for Western yellow.

GRAIN.—The markets are very sensitive to any reports of the crops, and when the heavy rains occurred, several days since, under the impression that injury would result prices advanced, but at the close prices are weak throughout.

Latest sales of wheat are of No. 2 Milwaukee spring, at $1 05¾; Nos. 1 and 2 spring, mixed, at $1 06; No. 2 spring, at $1 04@1 06; New York No. 2 spring, July option, at $1 04; No. 3 spring at 95c.; No. 2 Northwest spring, August option at $1 02; ungraded spring at 85c.@$1 05; amber Michigan at $1 1½; ungraded red at $1 02@1 09; No. 2 red at $1 08@1 12; do., July, at $1 10¾; do., August option, at $1 03¾; do., delivery by August 27, at $1 04; do., September option, at $1 02¾@1 02¾; No. 1 red, steamer, at $1 07; white State at $1 24@1 26; No. 1 white at $1 25; do., August delivery, at $1 14; do., September delivery, at $1.10@1.10¾; No. 3 white at $1.18; No. 2 amber at $1 07; do., steamer at $1 05; No. 1 amber round, July option, at $1 11; No. 1 red steamer at $1 07. Corn at for New York No. 2, July option, at 47¾@48c.; do., August option, at 47½@48c.; do., September option, at 48¾@49¼c.; steamer mixed, July option, at 46¼@46¾c.; do. August option, at 46¾c.; do., September option, at 47¾@48c.; steamer mixed at 46¾@47½c.; ungraded mixed at 45@48¼c., the latter for very choice: western white at 50¾c., and round yellow at 53c. Oats are for New York No. 2 white at 34c.; New York No. 1 at 34c.; New York No. 3 at 33c.; New York No. 2 at 47¾@48¾c.; Kansas mixed at 48c.; ungraded mixed at 45@48¼c., the latter for very choice: western white at 50¾c., and round yellow at 53c. Oats are for New York No. 2 white at 34c.; New York No. 1 at 34c.; New York No. 3 at 33c.; white western at 32@33½c.; mixed western at 31¾@33¾c.; white State at 33@36¾c.; mixed State at 32@33c.; New York No. 1 white quoted at 37@38c.; New York No. 3 white at 35c.; New York extra at 34¾@35c.; New York No. 3 at 31¾c.

HAY AND STRAW.—Most of the receipts of old are the lower grades, that have apparently been urged forward to make room for the new crop. On this lower grade of stock prices are easy.

Bale hay, 45@55c. for shipping, and 60@75c. for retail qualities; Straw quoted at 40@45c. for long rye, and 40@45c. for short rye; and 30@35c. for oat.

Exports past week 2,139 bales. Since Jan. 1st, 38,500 do.; same time last year, 28,975 do.

HOPS.—There is nothing doing outside of the small lots needed by brewers, but supplies being moderate, prices hold as before. New Yorks, good to prime, 10@12c.; do., low to fair, 7@9c.; Eastern, 7@10c.; Wisconsin, 7@10c.; Yearlings, 2@ 3c.; Olds, all growths, 1@2c.; Pacific Coast hops, 10@12c.

LEATHER.—The sales are at 19½@20c. for light; 19½@21c. for middle; 20@21½c. for heavy and 17½@19c. for good damaged.

PROVISIONS.—Hog products have been very dull, and prices barely supported, but no radical changes. Mess pork quoted $10 25@10 50 for spot lots; $10 10 for July and August; $10 20 for September; and $10 30 for October. Bacon at 6c. for long clear. Lard at $7 22½ for spot lots; $7 22½ for July and August; $7 30 for September. Stearine at 9 for prime. Beef hams at $22. Beef—extra mess, $11 75@12; plain mess, $10@11 50; packet, $12@13 50 for bbls. and $16@17 for tcs.; family at $13@14; extra India mess, $19@20 for city brands; do. Philadelphia, $18@$19.

POULTRY AND GAME.—Prices for live fowls are unusually strong. Chickens in good demand for near watering places; spring chickens, N. J. 18c.; State 16@17c.; Western, 13½@14½c.; Southern 13@14c. Fowls—N. J. 13@14c.; S. & W., 12@13c.; Roosters, 5@7c. Turkeys, 11@14c.. Ducks—Choice, pair, 60@75c.; other 40@85c.; Spring 50@78c. Geese—Choice, $1.25@1.50; other 88@$1.12.

Dressed poultry in good demand, and higher. Dry picked turkeys, 15@16c.; other, 13@14c.; spring chickens, Phila., 23@24c.; N. J. 18@20c.; S. & W. 15@17c.; Pa. fowls, 14@16c.; N. J., 12@15c.; State and Western, 11@12c.

Game still only represented by the stall-fed pigeons, $1 25@1 37 doz., full grown; young, $1@1 12.

TOBACCO.—There is a good degree of life to the market, and prices strong Quotations are for

Missouri, Kentucky, and Tennessee—Washed fleece, 33@35c.; unwashed, 20@26c.; unwashed combing, 28@32c.

LIVE STOCK MARKETS.

Saturday, July 20th, 1878.

BEEVES.—Receipts for the week, 11,316 head: do., last week, 7,933 do. The demand has not been so sharp, as the remarkably hot weather has restricted sales to wholesale butchers. Grass fed Cherokee sold at 7c.; choice do., 9¼c.; Colorado steers, 8¼@9c; native, 8@10c.; a few at 10¾. Receipts large for the season, and especially for the hot weather that prevails.

COWS AND CALVES.—A few head have changed hands at $30@55. During the late high prices of beef some cows went to the slaughterers, but that class of stock does not require replenishment from high-priced milkers.

VEAL CALVES.—Market quiet and low, common to good. Buttermilk, 2½@3¼c.; a few at 3¾c.; ordinary to prime milk, 5@6¼c.

SHEEP AND LAMBS.—Receipts for the week, 27,419 head; do. last week, 20,445 do. Ordinary stock sold at 3¾@4¼c.; fancy sold for export at 5¼c. A few choice N. J. lambs, 7c.; others, 5¾@6¾c.

SWINE.—Receipts for the week, 20,049 head; do. last week, 22,005 do. Quotations nominally, 4¾@4¾c. per lb.

Farmers and Gardeners,
LOOK TO YOUR INTERESTS!
THE VITATIVE COMPOUND,
Or Seed and Plant Invigorator.

The greatest discovery of its kind of modern times, for increasing the vital force and early maturity of Seeds and Plants. Patented April 2d, 1878.
Early Maturity, Sure Crops, Large Yields, and
DESTRUCTION OF INSECTS.
Better than Guano or Plaster, at a fraction of their cost. The Compound is applied directly to the seed before planting, and its chemical properties insure speedy and certain germination, and by creating an artificial warmth aid the young shoot in its first stages, completely overcoming the dangers incident to wet, cold or late springs, and at the same time protecting the seed and shoot from the ravages of worms or insects. Put up in neat packages of three sizes—the smallest sufficient for a peck, the medium for a half bushel, and the largest for a bushel of seed. Price 50 cents, $1 and $2 respectively. Sent by mail or express on receipt of price.
Agents wanted. Send for Circulars containing testimonials. Address WAUGAMAN & CO.,

Reading for the Young.

"POCKET-MONEY FOR THE YOUNG PEOPLE."—No. 11.

ANNIE L. JACK.

"But," says practical Josie, "you know, mamma, the grapes were three years before bearing." "True," I answered, "that was learning to labor and to wait. But, if you want a fruit that yields quick returns, listen to this report of the little boy who planted Black-cap raspberries."

Two years ago, a small, but intelligent lad, of ten, was looking over the catalogue of fruit, when a picture of "Mammoth Cluster" attracted his fancy. He had "pocket-money," and after asking if he might plant his "tips" in the last furrow of the headland nearest the fence, and receiving permission, sent by mail for fifty of said tips. They were planted, grew and flowered the first season, and he was a proud boy in August, when he could bring in a dish-full for tea, as was done several times that year. The next summer a few stakes were put in and a wire run along near the top; the raspberry vines were thrown over, and twined along the wire, and the tips set out in another row; besides a sale of fifty which repaid the first outlay. The berries ripened full, large and black, and were regularly gathered and sent to market, in five-cent gallon baskets, although experience has proved that quart-boxes, as used for strawberries, would be better. During the flush of picking, this boy hired his brothers and sisters who could be spared, paying them five cents an hour, and they seemed to enjoy the business. The profits, after paying expenses, were twenty-two dollars, and this season the oldest vines and last year's planting are alike thrifty and full of bloom. Black-caps, especially the Mammoth Cluster, sell better than any other *black* berry we have seen in the market, and although prices may vary, I think I may safely say that there is pocket-money in this choice variety of raspberry.

One year, not very long ago, one of our girls determined to try peas. She chose "Carter's First Crop," and with a proper forethought, had begged of papa the previous autumn to make a few rows on a high knoll where the ground is first bare in spring. Here, one sunny day in March, the peas were sown, a foot apart, every third row being omitted to form the double rows so convenient for staking. This pea does not need tall stakes, and a girl can chop and point apple branches quite easily, and put them in as neatly as a boy. When the peas were ready to pick they were measured and put into old boxes, holding a bushel each. At the same time roses, lily of the valley, and fragrant honeysuckle were in their first bloom; and this enterprising girl went to the woods for moss; picked and arranged dainty little bouquets, rolling up the stems in moss and placing them around the peas. They were not plentiful on the market, and the flowers paid expenses of marketing the peas, and left a dollar balance, while the Carter's being the first fresh home-grown peas, brought in $2.50 a box, thus clearing $8.50, on the *first* which was, of course, the *best* picking. The chief secret was in getting the peas in *early*, having the rows ready in autumn. It did not injure them when, in April, a heavy snow-fall covered the ground; no doubt the poor man's manure, as it is called, was beneficial to them, and they were soaked slowly and ready to start while the ground was damp. I would impress on the minds of young people the necessity of planting the *best* of everything, as it costs no more labor, and you know, your grand old poet, Whittier, says:

"Give fools their gold, and knaves their power,
Let fortune's bubbles rise and fall;
Who sows a field, or trains a flower,
Or plants a tree, is more than all."

SPENDING-MONEY FOR THE GIRLS.

J. E. M'C.

A little girl called in one day to ask me if I did not wish to have her crochet some narrow edging for me. She showed me some pretty samples, told me how well it would wear, outlasting two sets of garments, and altogether was so convincing that I engaged her to make for me the amount of one spool of cotton. She set her price according to the cotton used, which was a very fair way, as it took about the same amount of crocheting to make up two hundred yards of thread, whether in wide or narrow lace. I was well pleased with my bargain, and found that the trimming wore for several years, though in regular use.

I found that she did a good deal of the work for other people, crocheting a beautiful wide lace for pillow-cases, that would almost last a lifetime.

The reason Susy made her pocket-money by this work was that she had *perfected* herself in it. Any bright, little girl a dozen years old might do the same, with the same painstaking, but not without. Then, she went among her own and her mother's friends, and modestly solicited custom. She did not press her wares offensively, but she went to work in a way that meant business. She was always ready to oblige, and would as readily crochet a strip for a pair of cuffs as for the hem of a skirt.

Half effort, or half knowledge never accomplished much, and a manner that is not pleasing will rarely meet with success.

I wish our good girls, who are so sadly in need of pocket-money, not merely for nick-nacks, but for the real necessities of life, as dresses, shoes and hats, were not so averse to helping a neighbor through her weary summer work. If they would cheerfully engage with some good house-mother for fair wages, for a few months, they might not only save the tax of their board at home, but also earn enough to supply the winter wardrobe handsomely. The experience they would get in regard to new modes of doing work (as each housekeeper has her system), would be worth as much as their wages. It is part of her business education, just as book-keeping is a part of a boy's business education. For as long as the world stands, and is divided off into households, the housekeeper's business will be the main trade for every woman to follow.

Perhaps the lady you live with is not exactly your ideal of sweetness and gentleness; but never mind, be as brave as the boys are in their pursuits. How much do they mind if their "boss" is not of the most approved type, so that they can learn their trade well with him. Don't be outdone by the boys in these days when there is such a buzz about "equal rights." Be brave enough to stick out this new line independently for yourself, and never fear that you will lose the respect of others. Very likely you may induce some good girl to try the same experiment, and so be doing a double good.

But whatever your tastes or aspirations, do not suffer yourself to be a burden to poor, hard-working parents when you can by some means help yourself.

Think over the subject by night and day, ask your Sabbath-school teacher or some other good friend, to advise you in the matter, and, above all, ask daily your Heavenly Friend to show you the way, and no doubt a way will be opened. You will taste the sweets of handling money fairly earned, and nothing else will ever show you the real worth of money. Be helpful yourself towards others, and you will never want for good friends.

OUR FOREIGN COUSIN

Tells of Some Methods of Farming.

Dear Rural Cousins: With great pleasure I noticed to-day in the Rural that two more boys, "Green John" and "Box Boy" desire to join our Cousinly Circle, and I am sure that all my new relatives will greet them with me with a hearty welcome. I think Box Boy is quite right about Slaverei or conceit, and I would advise the boys to take a lesson from this example in using more polite language towards the cousins of the tender sex, because we never can gain any advantage over them; they are too smart, and witty for us boys to dispute with.

In my last letter I promised to write some more about Switzerland and I shall fulfill that promise in describing, first the duties and burdens of the Rural, women and girls, for I believe that the greatest difference in the agricultural life of these two countries is found in the occupations of the fairer sex. To give you a true illustration of the work of a well-to-do farmer's wife or daughter, I will try to describe just one of their usual day's-work in summer, as I have witnessed it very often.

The woman or girl of the house is the first one to rise in the morning, usually at half past three o'clock. She has to prepare a cold lunch for the men, wake them up and wait on them. After the men are gone, she cleans out the cow stable, feeds the cows and milks them, takes care of the milk and cream, and after this is done she feeds the pigs, dogs, cats and other domestic animals; then she takes a tub, goes with it to the public fountain, perhaps a quarter of a mile from her home—fills it up with water, places the tub on her head and walks home straight as a soldier, never minding the weight of about fifty pounds on the top of her head. The next thing is to get breakfast ready. That consists of beefsteak and eggs? Oh no! of nothing but boiled milk, coffee and brown bread. After breakfast, while the men are doing chores and smoking their cigars, the women wash up the dishes, clean the house, make the beds etc., until in a very short time the men with scythes on their backs are appearing before the doorsteps, hallowing for the women to come in the field and to fetch with them the forks, rakes, a jug-full of wine and a loaf of bread, and then the poor women have to drop their housework and follow the men out into the field where they have to handle the forks and hand-rakes until noon. Then all go home together, the women to prepare the dinner and the men to hammer the edge of their scythes thin again, for they never use any grindstones to grind them.

After a hearty dinner consisting of boiled pork and potatoes,—the whole year round the same thing,—plenty of grape wine and bread without butter, the men harness up the oxen and take the whole family out in the field again. The men pitch and load the hay, the women have to rake it up. After the hay is loaded they all go home again to unload it, the men pitch it from the wagon and the women have to store it away: in this way they keep at work until night. About sun-down the women go home, milk the cows, feed the domestic animals, and get the boiled milk and coffee ready again for supper. If the ordinary house-work is all done and it happens to be Saturday evening, the hired girl has to grease the hired men's boots and shoes and mop the floors in the kitchen and dining-rooms, and for all this hard work the ladies belonging to the family don't get anything in recompense, not even a calico dress; they have to make the dresses during the long winter evenings, and the hired girl gets generally only $25 a year, a couple of aprons and a pair of shoes with strings to them, and on Christmas the hired men make her a present of ten cents for greasing their shoes and mending the whole year! In the spring the women have to go out almost every day in the meadows and grain fields to pull out thistles or other weeds, load them on a kind of wheel-barrow, and carry them home to be fed out to the goats. The hoeing, the grain-cutting, or binding is mostly done by female help. I could tell you a good deal more about female occupations in my native country, having had sufficient chance to compare the difference between the female labor in Europe and America, but I am afraid that some of my lady cousins here might feel a little offended towards me, thinking perhaps, that at a future day I would be one of those great lords too, who like to see women doing the work that belongs to the masculine department. Certainly I think sometimes that many of the American ladies are too extravagant. Some of them are too proud to do even the lightest housework, but the greater part of them, and I hope that all our Cousins belong to them, understand their place and future position and make, through their work, the fire-side a pleasant and agreeable place, not only for themselves but for everybody. With the ardent desire that I may not be mistaken in those hopes, I ask once more the girls' indulgence and bid adieu!

Clinton Co., N. Y. John Schwyn.

RUSSIAN COMMUNAL VILLAGES.

Amongst the families composing a Russian village, a state of isolation is impossible. The heads of the households must often meet together and consult in the village assembly, and their daily occupations must be influenced by the communal decrees. They cannot begin to mow the hay or plow the fallow field until the village assembly has passed a resolution on the subject. If a peasant becomes a drunkard, or takes some equally efficient means to become insolvent, every family in the village has a right to complain, not merely in the interests of public morality, but from selfish motives, because all the families are collectively responsible for his taxes. For the same reason no peasant can permanently leave the village without the consent of the commune, and this consent will not be granted until the applicant gives satisfactory security for the fulfilment of all his actual and future liabilities. If a peasant wishes to go away for a short time, in order to work elsewhere, he must obtain a written permission, which serves him as a passport during his absence; and he may be recalled at any moment by a communal decree. In reality he is rarely recalled so long as he sends home regularly the full amount of his taxes—including the dues which he has to pay for the temporary passport—but sometimes the commune uses the power of recall for the purpose of extorting money from the absent member.

Sabbath Reading.

WHAT OF THAT?

Tired! Well, what of that?
Didst fancy life was spent on beds of ease,
Fluttering the rose leaves scattered by the breeze?
Come, rouse thee! work while it is called to-day!
Coward, arise! go forth upon thy way!

Lonely! And what of that?
Some must be lonely! 'tis not given to all
To feel a heart responsive rise and fall,
To blend another life into its own.
Work may be done in loneliness. Work on.

Dark! Well, what of that?
Didst fondly dream the sun would never set?
Dost fear to lose the way? Take courage yet!
Learn thou to walk by faith, and not by sight;
Thy steps will guided be, and guided right.

Hard! Well, what of that?
Didst fancy life one summer holiday,
With lessons none to learn, and naught but play?
Go, get thee to thy task! Conquer or die!
It must be learned! Learn it, then, patiently.

No help! Nay, 'tis not so!
Though human help be far, thy God is nigh,
Who feeds the ravens, hears his children cry.
He's near thee, wheresoe'er thy footsteps roam;
And He will guide thee, light thee, help thee home.

OF READING.

E. J. S. O.

Were we asked to name one of the most important influences that can affect the complex machinery of the brain, or mold the character of the mind for good or evil, we should reply—Reading. And this because we are fully convinced that its subtle power over our moral and intellectual natures is beyond the power of calculation. Memory, that mystery of mysteries, never fathomed because unfathomable, is ever reproducing in endless variety all that has passed into the brain through this medium by the instrumentality of books. Too often, however, does it happen that the good loses its hold but too quickly, whilst the evil is retained tenaciously, and endlessly recurs in thought. Our sinful natures are prone to assimilate the evil impressions produced by reading, rather than the beneficial, which pass but too rapidly away. And it is because we feel that so much of the evil that is in us is due to the influence of reading, and is yet so little realized or considered to be thus introduced to the mind, that we have selected the subject for an essay addressed to Sunday-school teachers. They surely, of all classes, need to be most watchful regarding what they read, since upon the healthy tone of their minds must of necessity depend so much of the good effects resulting from their teaching. Reading therefore is especially an important subject, and we solicit attention to a few "thoughts" thereupon.

The most casual observer must often be struck by the fact that great variety exists amongst his fellowmen as to the *methods* of reading. This, at first sight, might seem a trivial and unimportant matter; but on consideration we think otherwise. To read in a state of true and perfect intellectual enjoyment we firmly believe that solitude is necessary. Buzz of conversation or of company, distracting influences of what kind soever, must of necessity divide the attention of the reader between his book and other objects. Probably, nay likely, this remark will hardly apply to "light reading." This we can quite understand. But to reading that has a didactic object in view, reading which promises something more than amusement for a leisure hour, it does apply; and such classes of reading, to be fully appreciated, and to prove beneficial, ought to be perused whilst the reader is in a state of ease and solitude, with naught to distract the thoughts from the subject or subjects in hand.

A few remarks on fiction, as relating to Sunday-school teachers, will be necessary at this point. Should teachers read fiction? We think that within certain limits they undoubtedly may, and indeed ought to do so. But what, it is asked, are these limits? Where is the line dividing commendable fiction from objectionable? What is the criterion for deciding what is fit for reading, and what only for rejection? Truly important questions these. Yet we imagine that the heart attuned aright, the mind that loves to linger over the sacred pages of the word of God, will not err much in its selection. Fiction which, without partaking of the sensation element, is merely an allegorical mode of inculcating good truths and a pleasant way of increasing our knowledge, cannot be objectionable unless read to excess, when its effects, on the mind must be weakening. But what shall we say of the harmful sensational literature so abundant? Truly such literature, pandering to our lowest appetites, is but a powerful agency for deteriorating the youthful mind. Shun it, teachers; for be assured that its evil effects are beyond the power of computation.

A word, however, regarding *quantity* of reading. We are not of those who uphold what is termed "book devouring," or, to speak plainly, an inordinate desire for new books to any extent imaginable. We are of opinion that the *many* are not at all bettered by the *quantity* of reading they manage to get through. Depend upon it, far greater importance lies in the *quality* than in the quantity of the books perused. The fact of a person having read an immense number of works does not render it certain that a commensurate amount of knowledge has been attained. On the contrary, it very frequently happens that those who read with such astonishing rapidity are as ignorant of the real design and drift of a book when they lay it down as before perusing it. Fast reading is a mistake. To fully master the sense of any work in which thought has been exercised by the author, a certain amount of reflection, varying of course with the intellectual ability of the reader, must be exercised by him when reading. Indeed many books require to be gone through several times before they can be at all appreciated or understood. Of course the more obscure the writer the greater must be the amount of study on perusal. And works of this nature, though popularly called "dry," are particularly suitable reading for teachers, expanding their power of instructing, and giving force to their powers of comprehension.

And, whilst speaking of suitable reading for teachers, let us devote a few thoughts to another branch of the topic. We think that Sunday-school teachers hardly attach sufficient importance to the necessity of understanding in some measure difficult portions of Scripture. They too often lose sight of the fact that the absence of knowledge on such points will probably cause astonishment in their little hearers, preternaturally quick in selecting difficult passages for explanation and seeking a key to hidden mysteries. To the end that all such difficulties may be obviated, teachers should devote more of their time to the study of God's word; and aided by commentaries and other works elucidating difficult texts and passages, they might be more fitted to teach, instead of needing themselves to be instructed (in the most important of knowledge), as is but too often the case. They would then be more ready and able to dissipate the darkness lingering over the youthful minds of their charge in regard to the mysteries of the Bible. There are so many works on these subjects that teachers need never to be at a loss for the means of Bible doctrines that they may have to explain at future times to their children. Careful and prayerful study of the word of God, therefore, should form the most important branch of reading in which the teacher can engage.

Historical and biographical are especially beneficial reading for Sunday-school teachers. A knowledge of the lives of good and great men, and general information regarding history, relating both to our own and other countries—these are almost indispensable adjuncts to the teacher's requirements if he would teach efficiently and well. The power of illustrating his addresses to the young is thus very greatly increased, enabling him to rivet the attention and augment the interest of his class. Such reading, besides fitting him for his labors, is of course extremely expanding in its effects upon the whole tenor of his mind. So also is the study of works relating to nature. Whilst loving the word of God, teachers should not neglect the open book of His works. Truly a marvelous book is this! Reading on natural history, in order to the possession of a knowledge of God's handiwork, is desirable for every Sunday-school teacher. For in teaching the young concerning the goodness of a kind Creator to His creatures, how greatly is the effect deepened and strengthened when the teacher can illustrate his meaning by giving instances of remarkable and interesting facts in the economy of nature! Therefore should teachers never neglect this class of reading, remembering that the young heart is often led, by simple wonder and astonishment at the goodness of the God of nature, to love and serve the God of grace revealed in the word read and explained.

Finally, we particularly wish our readers to be impressed with a sense of the vast importance of the subject. By some this may be considered a trivial matter; but to us it is one of great, nay of solemn moment. Those who have not carefully and thoughtfully considered the question can hardly comprehend how wondrous is the effect of reading on the mysterious tracery of the mind, the under-current of its subtle workings held in memory's casket. Truly we are fearfully and wonderfully made! Reading there is before us, of two classes—good and bad. We choose the bad; and lo! how mighty its evil influence! The unbidden evil thought, desire, imagination, the objectionable morals, and low "mannerism," once implanted in the mind by reading and never effaced,—all these, and many other evils, rise up from time to time, continually reproaching us, everlasting sources of wrong thinking and wrong acting. But if we select the good, how genial and beneficial its effects! How invigorating its influence over our natures, how great its power of increasing our intellectual capacities!

PERSONAL ITEMS.

Mr. Justice Davis will make Chicago his permanent home.

Mrs. Grant now weighs six pounds more than her husband, who tips the beam at 168, the madame requiring 174.

General Fitz Lee and Senator Johnson will visit England for the purpose of capturing Virginia immigrants.

A SOUTH CAROLINA negro says of Wade Hampton: "Fo' do Lawd! but ebery time dat man opens his mouf I feels dat I am turnin' whiter an' gettin' de kinks out'n my h'ar."

One of General Fremont's shoulders is much higher than the other, and the old campaigner is very gray, too. He is now in New York and will not enter upon his Gubernatorial duties in Arizona until August.

When Jeff Davis unfortunately came to life the other day and spoke his secession piece before the army of Tennessee, the star-spangled banner kept up such a patriotic flapping just over his head that it annoyed him.

"Will and Ella," said Mrs. Agent Hughes of the Standing Rock, D. T., Indian Post, speaking of General and Mrs. Sherman, "are my warmest, friends;" and when the profane W. Tecumseh heard about it he wrote a letter denying the soft impeachment.

Beaconsfield was once dining with Princess Mary of Teck, when the hostess said; "You have the Queen with you, Parliament, and the country; what more do you want?" Lord Beaconsfield glanced at his plate, and solemnly replied, "Potatoes, ma'am."

Congressman Schleicher, of Texas, deposited his three hundred pounds avoirdupois in a Houston chair and was interviewed. The Mexicans, he said, want to fight; they must fight; they doubtless will fight, and the only thing for us to do is to guard the Rio Grande in a proper way.

Tilden is an early riser, and the neighbors can see him any pleasant morning he is in Gramercy Square attired in a negligent costume of dressing-gown, slippers and other articles, from which mysterious strings dangle, engaged in interviewing every bud and blossom that springs from the well-kept grounds.

Senor Mata, the newly-appointed Mexican Minister of Foreign Affairs, is a black-haired, black-eyed and black-bearded little fellow, well oiled at the joints of the knee. But what is of more importance, he is a good friend to this country, seeing that we could swallow the land of the Montezumas at a gulp, and wants peace on the Rio Grande.

After he had so dramatically electrified the New York politicians by the suspension of Arthur and Cornell, during his recent visit to this city, Sec. Sherman went down to Long Branch and touched off a sensation there. In a chat with ex-Governor Warmouth and Tom Murphy, Mr. Sherman said: "Grant is now the man I think. If the Republican Convention were held now he would be nominated easily."

Chin Han Pin, the new ambassador to the United States from China, is accompanied by a Consular corps accredited to Cuba, Peru and San Francisco. Chin Han Pin is a highly educated and distinguished diplomat and statesman, and has been commissioner to several countries. He visited this country some years ago to arrange for the education of Chinese students. He will remain here about ten years at Washington.

Mr. Thurman is described as the most unostentatious-looking man in the Senate. He dislikes an undertaker-like suit of black broadcloth, and generally wears light gray clothes of loose and comfortable fit. He is independent enough to carry a snuff-box, as Henry Clay and other statesmen of earlier days did. His daily life in Washington is more like that of an honest, well-to-do farmer than a Senator's, and he thoroughly enjoys the comforts of home.

George S. Appleton, who died in New York lately, was the linguist and business man of the Appleton publishing firm. He understood all the modern languages, arranged for all press contracts and advertisements, and attended to the publication of all the works. His two elder brothers were among the founders of the Century Club, but he only became a member in 1873. Of the completed club roll of 600 members, Mr. William Cullen Bryant was the first to die, and Mr. Appleton was the second.

The Shah of Persia left 25 of his 36 caskets of gold at Paris, where he spent $600,000. His expenses at the Grand Hotel were $680 a day. Extracts from his disputed bill at Fontainbleau are published. He was charged $300 for flowers, $12 for a melon, $5 for a cigar, $160 for three carriage drives, and $4 each for twenty chickens; his rooms were set down at $10 a day each; two boxes of cigarettes cost $10, and $2 apiece for a dozen peaches. He received during his stay at Paris 5,400 begging letters, asking for amounts varying from 50 francs to 3,000,000 francs, the aggregate amount sought being $50,000,000 francs.

Great men are having a bad time of it just now, for besides the pickle Sherman and the other "visiting statesmen" are in, Thomas Ewing has been blown up in a Mississippi steamer; Disraeli is a tramp at Ottawa; James Madison has been acquitted of a charge of burglary at St. Louis; Daniel Webster, a shoemaker of Washington, has been figuring in a law-suit about a pair of boots he made for John C. Breckenridge; George Washington is in jail in twenty different places; Henry Clay was sentenced to be hanged last week; Andrew Jackson was arrested in St. Louis a few days ago under the vagrant clause, and given twenty-four hours to get out of town. The country seems to be drifting to the d—— well, to the dogs.

Wit and Humor.

A STARE-CASE—A telescope.

A SWEET craft—Court-ship.

A WRATHFUL land—Ire-land.

LIGHT work—The gas man's.

SHORT horn—a busted bugle.

TRUTH is mighty—hard to tell.

A MISS-TAKE—Getting married.

A ROBIN' red-breast—The Indian.

AN attached couple—Oyster shells.

WE have had a whole week of sundays.—[*Commercial Bulletin.*

"CAN love die?" inquires Mary E. Nealy in a recently published poem. It cannot, though it gets dreadfully adjourned occasionally.

IT is bad enough to have dog days; but it is almost too much for good nature to be afflicted also with cat nights.—[*New York Commercial Advertiser.*

"TELL your mistress that I've torn the curtain," said a lodger to a female domestic. ".Very well, sir; mistress will put it down in the bill as extra rent."

A LITTLE deaf-mute boy was asked to show his skill in the use of the English language on his slate, and he wrote: "A man ran from a cow. He is a *coward.*"

SWELL—"I want you to make a short coat without tails or seams in the back. Do you know what I mean?" German tailor—"Yaas, yaas, I know vat you vant. You vant a straight jacket."

A BIG Yankee from Maine, on paying his bill in a London restaurant, was told that the sum put down didn t include the waiter. "Wal," he roared, "I didn't eat any waiter, did I?" He looked as though he could, though, and there was no further discussion.[—*Ex.*

THE New York Communists recently paraded with a banner saying "Bread or lead." If that's all they want they can stop into some North-river restaurant and get both in one. These fellows don't want anything containing yeast, as that is inclined to work.—*Lowell Courier.*

IT is said that Richard Grant White's good lady has just presented him with a blessing, and that he is in a quandary as to the correctness of saying "I have got a baby," or "I have gotten a baby," several very fine philologic distinctions being involved. Somebody asks "why don't he keep quiet about it, or say, 'I have obtained an infant.'"

DAN HOOK (the late Dean of Chichester) was associated with one of the late Bishop Wilberforce's favorite witticisms. "What articles of ladies' attire," the bishop used to ask, "give the name of two of the most eloquent men in the Church?" When the auditory gave up the puzzle, Dr. Wilberforce would say, with great glee, at the astonishment at his own egotism, "Hook and I."

AN old colored woman of one of the back counties sings all the good old Methodist hymns, but she gets them mixed sometimes. She sings:

Sweet prospects, sweet birds and sweet flowers
Have lost all their sweetness but me.

And another:

Am I shoulder of a hoss,
A quarter of a lamb?

The old lady probably means well.

AN Irish gentleman writes to *Truth* to say that he has never found a Frenchman who can pronounce this: "Twimblerig Thistlethwaite thievishly thought to thrive through thick and thin by throwing his thimbles about, but he was thwarted and thwacked, thumped and thrashed with thirty-thousand thistles and thorns for thievishly thinking to thrive through thick and through thin by throwing the thimbles about."

AN old pioneer, who was something of a fatalist, lived in a region infested by Indians. He always took his gun with him, and once, finding that some of his family had taken it out, he would not go without it. His friends rallied him, saying that there was no danger of the Indians, as he would not die till his time came anyhow, "Yes," said old Leather-stocking; "but suppose I was to meet an Indian, and his time was come, it wouldn't do not to have my gun."

Surest Tranquilizer of the Nerves.

THE surest tranquilizer of the nerves is a medicine which remedies their supersensitiveness by invigorating them. Over-tension of the nerves always weakens them. What they need, then, is a tonic, not a sedative. The latter is only useful when there is intense mental excitement and an immediate necessity exists for producing quietude of the brain. Hostetter's Stomach Bitters restores tranquility of the nerves by endowing them with the vigor requisite to bear, without being jarred or disturbed unhealthfully, the ordinary impressions produced through the media of sight, hearing and reflection. Nay, it does more than this,—it enables them to sustain a degree of tension from mental application which they, would be totally unable to endure without its assistance. Such at least is the irresistible conclusion to be drawn from the testimony of business and professional men, litterateurs, clergymen and others who have tested the fortifying and reparative influence of this celebrated tonic and nervine.

The Horseman.

THE ARABIAN HORSE.

For ages it has been the fashion to speak of the Arabian horse as the type of equine perfection physically and morally, and down to to-day the fashion has a multitude of adherents, especially among those who go to books rather than to nature for their facts. The Oriental descent of the Arab, his remoteness, the difficulty of securing a specimen, the high esteem in which he is held in the land of his birth, together with his undoubted excellencies, all tend to invest him with poetic attributes, and poetry has to do with the imagination rather than with reality. Moreover, there is little doubt but that in many points the courser of the desert greatly excelled even the best of the horses owned by Europeans a couple of centuries ago; but while with Oriental fixedness, the Arabian of to-day is the same as the Arabian of a century ago, the thoroughbred of our times is a vast improvement on the thoroughbred that excited the admiration of last century. In effecting this improvement, the care and skill of breeders in selecting and coupling the stoutest, best and fleetest for generations, have certainly been more potent than the admixture of Oriental blood to which it is usually attributed by the writers above spoken of. Yet in view of the fact that nearly all of the fleetest horses on the European and American turf, trace their descent more or less directly from some of these Eastern flyers, the Arabian horse will, for ages to come, excite a degree of interest disproportionate with his merits.

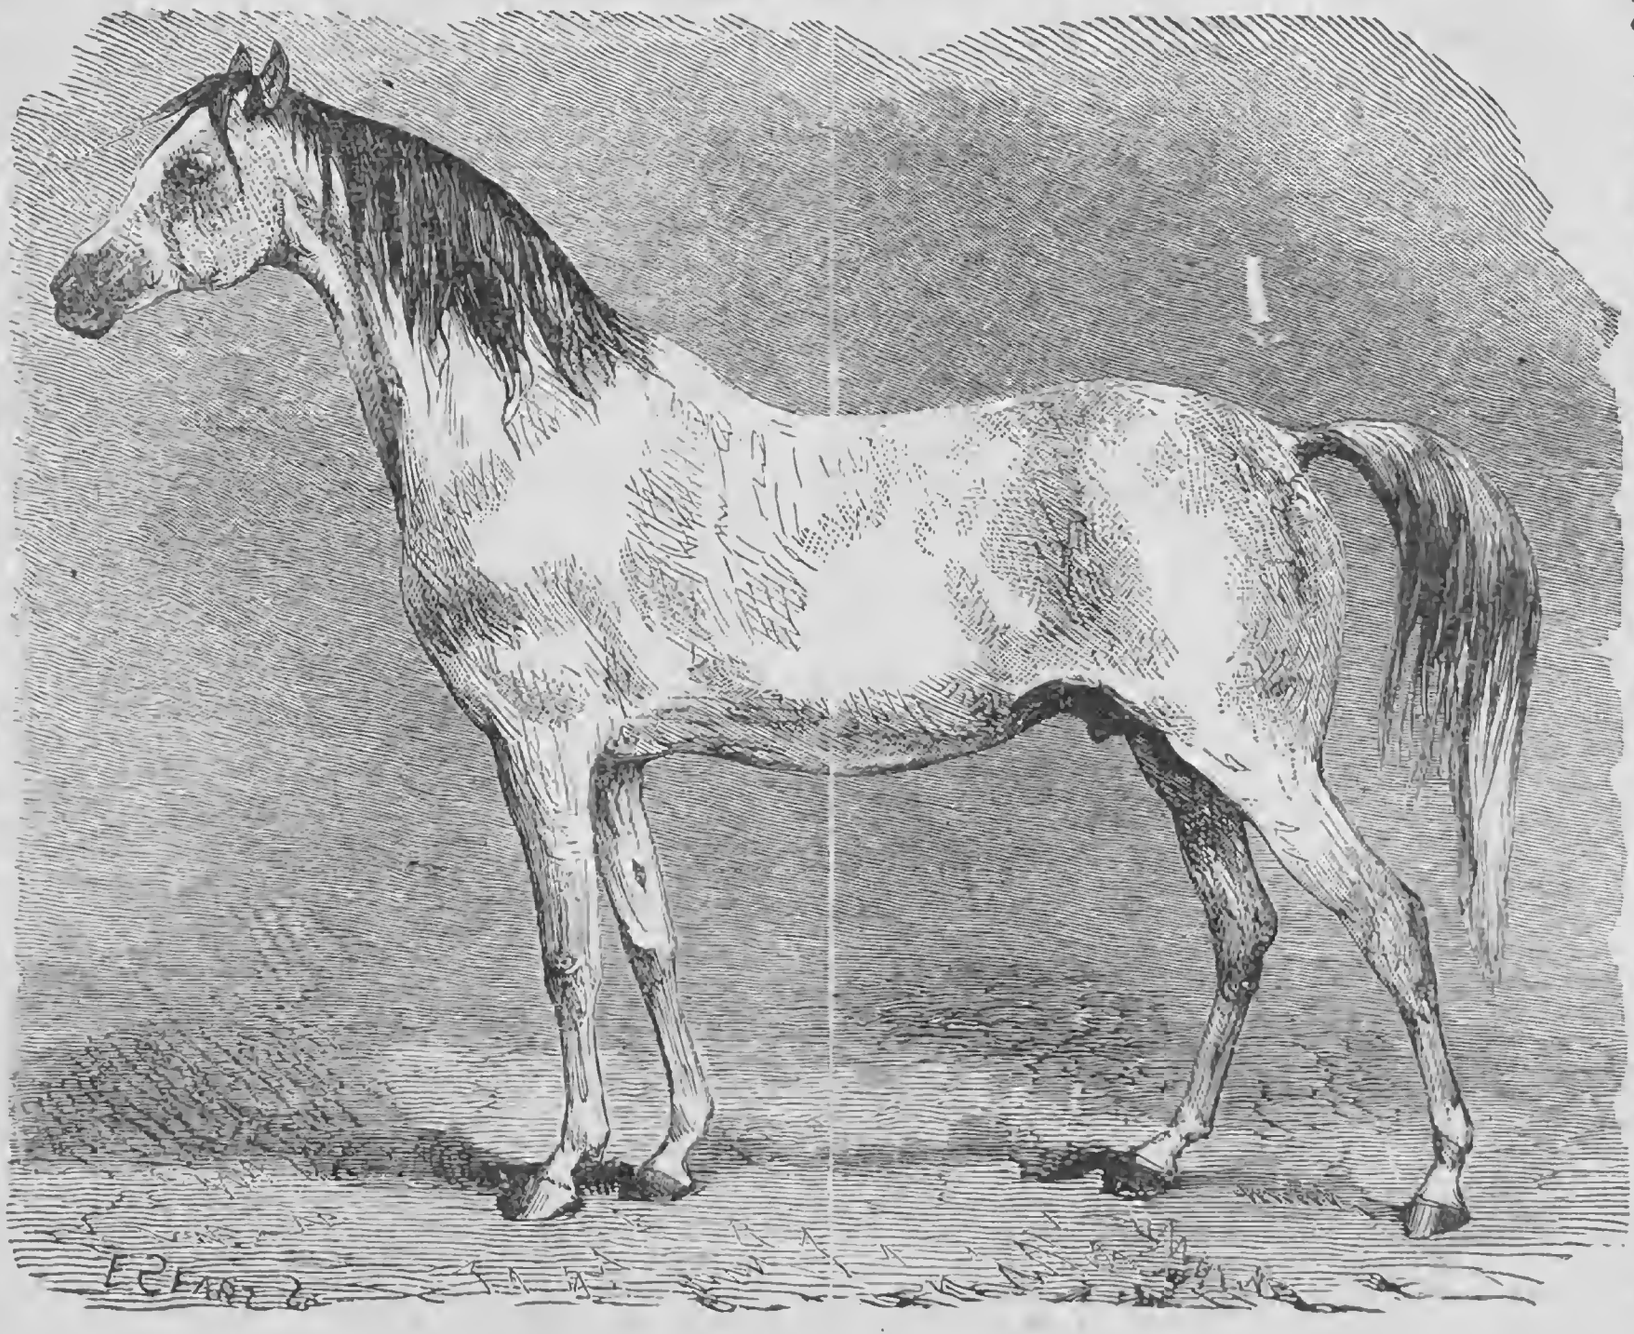
There are three breeds or varieties of the Arabian horse; the Attechi, the Kadischi, and the Kochlani or Koheylani. The last trace their genealogy back two thousand years; are principally bred by the Bedouins in remote desert places, and are much more highly prized than either of the others. Males of this strain can be purchased without much difficulty, at a high price, but a mare is rarely obtainable at any price, as the Arabs set a far higher value on the female than on the male, trace the pedigree through her, and on her alone center their pride and affection. When suckling, the filly is fed camel's milk along with that of its dam; when able to masticate, it is given in addition bruised and softened barley; and after it is weaned, it is fed partly on grass, though through life barley and dates constitute its principal food. It is broken early, the children first riding it, then the youngsters, and finally full-grown men. It lives with the family, shares their tent, plays with the children, and is always treated with tenderness and affection. This treatment it repays with mildness, docility and great regard for its owners, in whose behalf it is at all times rejoiced to strain its utmost powers.

The Arabian horse, though small — seldom much over 14 hands high — is an extremely handsome animal. The forehead is wide and flat; the face short, with a stright, flattened and broad nose; the nostrils wide and open; the lips thin; the cheeks flat; the mouth small. The ears are small, straight and mobile, and placed rather widely apart; the eye prominent, bright, and energetic. The neck is long and arched; the joints large and strong; muscles of great power stand out under a glossy, short-haired, silky coat, underneath which, in every direction, can be noticed the tracery of veins. The chest is broad and deep; the legs shapely and sinewy; the hoofs rounded and hard; the whole appearance mild yet prond. The color is generally white, light-gray or mottled; often chestnut, rarely black or bay. Its form combines great strength and agility; its powers of endurance in traveling great distances over the arid sands, without food or water, are marvelous; and though small, it is a better weight carrier for its size than any other breed.

(CHAMPION HEREFORD.—See Page 486.)

Of the most famous of these horses introduced into England, the first to gain celebrity was the Darley Arabian, imported during the end of Queen Anne's reign. This animal was the progenitor of some of the finest horses that ever ran; among which were Flying Childers and Eclipse, and the 334 winners begot by the latter. The horse usually known as the Godolphin Arabian, imported one hundred and fifty years ago from Paris, where he trudged before a water cart, is now generally thought to have been a Barb. Of his progeny 354 have been winners on different race-courses, and it is generally admitted that no imported Oriental sire, either Turk, Barb or Arabian, has been of any benefit to the English stock, or consequently to that of the United States, since his day.

While the Arabian is more docile and good-tempered, the English thoroughbred is higher, longer, and larger in every way; fully as enduring when not weakened by overtraining; fleeter of foot, as shown in numerous trials; and in all respects a finer and more serviceable animal than the small but shapely courser of the Arabian wilderness.



ARABIAN HORSE.

The Poultry Yard.

POULTRY BREEDING.

A. M. VAN AUKEN.

Many persons keep their fowls in one or more flocks, feed all alike, and set eggs from the lot in the basket. Now, with this course, your chickens will "run out," or at least get no better; you will have to keep one or more cocks with each flock; and if you introduce new blood, you will have to get new cocks all round. Now, I propose to divide fowls into two classes—one class to be designated as breeders, and the other as layers. In this article I shall describe the management of the breeders.

The best time of the year to hatch out the stock intended for breeders is in the month of June, for this latitude; for the reason that, if hatched then, they will not be quite mature enough to begin to lay before February; then, when we begin to set about that time, we shall have eggs to set from fresh instead of from jaded stock, while our chickens will be more apt to hatch and will be stronger when hatched than those from fowls that begin to lay in November and December.

In order to make the matter as plain as possible, let us suppose that we buy a setting of eggs from Mr. Jones, one from Mr. Black, another from Mr. Smith, and still another from Mr. White. Then when the chickens from these are grown, we pick a cockerel from Mr. Jones' chickens and mate it with the pullets from the eggs bought of Mr. Smith, while a cockerel from Smith's chicks is mated with the pullets from the eggs bought from Mr. Black, and so on. Now, then, we find among the pullets in a certain coop an exceedingly good layer; we save all the eggs from her apart from the rest and keep the chicks from them separate, and use cockerels from her for our stock o breeders.

Now, as to mating and feeding: never mate a cock with less than ten hens, and if he is a vigorous cock, twenty will be better. You look surprised! Well, I know that it is usual to say "from five to ten are enough for one cock," but I am not the only one who stands on the above plank. J. K. Felch, says: "According as the cock is vigorous, assign from twelve to twenty hens; there must be no coercion on the part of the cock; let his flock be large enough so that the invitation shall come from the female side of the house." W. A. Burpee, of Philadelphia, says, that he bred his Brown Leghorn cock "All Right" to twenty-seven hens with satisfactory results. J. W. P. Hovey, says, that he "mated a son of Honest Abe—Light Brahma—to eighteen hens, when ten months old, with splendid results, and no decrease in vigor till, when four years old, he was stolen."

As to feeding: while growing, feed all they want; I feed three times a day till the chickens are ten weeks old; after that, twice, and give plenty of bone-making food; not corn-meal, as it will make too much flesh, and not enough frame. After they are put up in the fall, make them work for their living; bury the feed in straw or dirt and scatter it well, so that it will keep them busy. Don't give them very much, and don't make their house very warm. Many will remember the numerous complaints sometimes heard about eggs not hatching.

The following, from the pen of J. K Felch, will be new to some and is worth reading a dozen times: "One man, from sixty-five eggs hatched sixty-two chickens, common grade stock. Another, from six settings, hatched sixty-five chicks, Brahmas. Still another has hatched from nine to fourteen chicks to a clutch, stock Brahmas mated with pullets. In all these cases the stock was mated in the early winter and allowed to go in and out in all kinds of weather, being fed in the morning all that they would eat, and the balance of the day made to shift for themselves."

It will require no little backbone to keep your breeders, your best fowls, in poor flesh, and have people ask you "why don't you feed those fowls better?" and so on, but the progeny of those birds will amply repay you for all such sharp criticism. The owner of a fast horse will not keep him rolling fat, even if all the people that saw him were to remark the scarcity of oats in his stable; and it is just as necessary that we should keep our breeders thin in order to have our eggs hatch as it is for a trotter to be kept thin in order to trot his best. How is it with cows, sheep, and hogs? Do those that are fat breed as well as those which are thin?

Now, let me copy one more paragraph from Mr. Felch: "Breeder, look to your pleasure in choosing nice fat pullets that you cannot injure, while growing, by over-feeding, and in your treatment of your breeding stock, use a little common sense." Be independent, and do not care if your breeding birds are called "scrubs."

Brown Co., Wis.

NEGLECT OF YOUNG CHICKENS.

While the farmer is busy during harvesting, and while his family in the stress of the season is pressed into the service, the growing chickens are sometimes forgotten, and perhaps a few hints may bring to mind their situation. As the hens leave the chicks, they feel lost at night, and poke themselves into nasty corners, or into old boxes, coops, or barrels, where they pile together, sometimes one on the other, crushing the weaker ones to death before this state of things is discovered. Often the filth accumulates so thickly that they lie on a heap of it at night, and become infested with parasites. A very little care will remedy this and keep the birds in health. Sometimes, however, they are very stubborn about a place of their own choosing. They either run back to the same place, after being driven away, or they scatter in all directions, thus running into greater danger.

Provide temporary houses or large boxes with low perches, and place them near the coops which were occupied by the hens and chicks. Gradually move the coops towards the temporary house a little every day. By this means the chicks will get near to the new roosting-places, and by moving away one coop at a time, they will settle into the temporary house. This, in turn, can be moved near the fowl-house which they are to occupy. This will save a great deal of annoyance, for what is more tantalizing than running down chickens night after night, while they are willing that you should repeat the operation as often as you please. If they take to a place where you cannot get in, and they are persistent, you may sometimes drive down a few stakes and block the entrance with an old door, or a few boards. If you have convenient trees for them to roost on, by all means let them use them during summer and early fall. Although it is some trouble and requires a little good temper to get them in their houses for the first time or two, when cold weather comes, yet their healthy condition will repay your pains. Feed them with grain twice a day, even though they get much of their own living; for some grain is necessary for their health, and moreover it lessens any inclination of theirs to do mischief in the garden amongst the fruit.

Henry Hales.

The Herdsman.

THE CHAMPION HEREFORD.

Herefords not unfrequently carry off the big prizes of the Smithfield club, but such an event as a Hereford bull's winning the champion prize over a Shorthorn which had been regarded as the best bull in England, makes the lovers of this admirable beef race not unreasonably jubilant. We published in the Rural of the 13th a portrait of Mr. A. Rogers' bull which won this enviable distinction. Now we recieve from the same source a large photographic portrait of his head alone which, accompanied as it is by the statement that it is regarded by good judges as representing an ideal Hereford head, we think will be of interest to our readers.

Farm Topics.

FARM WORK FOR AUGUST.

WEEDING.

The farmer's life is a busy one. During August there is little time for idling. In this hot weather weeds grow and mature with great rapidity. Weeds should be often mowed or dug up or pulled in the pasture and in waste places. This is an excellent time in which to kill quack-grass by frequent cultivation. Docks, thistles, and other coarse rubbish should be burned or buried, and never thrown into the highway to be run over or to remain in an unsightly pile. It is the best time for killing all sorts of bushes and briars, by cutting off the tops near the ground. After they are so cut, if the place is suitable, sheep are a great aid in the work, and it is work which they do cheerfully.

ODD JOBS.

There is no better time of year for clearing out swamps and digging ditches. Tiles can be laid in low places where needed when the fields are used for pasture or after the hay is cut from meadows. Keep a sharp lookout and work frequently among ruta-bagas and mangels. They should be well thinned, if not already thinned. Most field crops are so conspicuously before the eyes of the farmer, that they are less likely to be overlooked than many other items of equal importance.

If you ever draw manure from town, now is a good time, for several reasons. It is usually plenty in summer, and it is dry and light. The roads are apt to be good, so that twice as much may be hauled at a load as in wet weather. A compost started at this time rots down rapidly. It is a good time for getting out muck. This is pleasanter and easier to have than road dust. It is almost a necessity to have a large lot of dry muck or dry loam to use about privies and stables. A generous layer all around the barnyard will prove an excellent investment.

WHEAT.

Of course, the farmer will be preparing ground for wheat. The land which produced oats, barley, clover or peas will be turned over and well cultivated,

The enterprising man has already selected his seed wheat from the best part of his field, or he has purchased some which was raised on a different soil. The selection should be made for a small part of the seed each year in the manner long ago recommended by George Geddes. That was, to select the best heads from the best bundles before threshing. After this, submit the wheat to the test of a good fanning mill.

When sowing wheat, drill in a little rather thinner than usual, with every other tooth of the drill stopped. In spring, two or three times give this a cultivating or hoeing. Count the cost, and note the result, and thus try to learn whether it will pay to cultivate wheat in our country.

ORCHARD.

The young orchard will be left without cultivation after the first of August. Weeds will be allowed to grow there, or more likely, there is a crop of some kind to cover the ground till winter or next spring.

EXPERIMENT.

Try an experiment on Autumn and winter squashes while in flower. Several persons have much increased the yield by artificially carrying the pollen from staminate to pistillate flowers every other morning. The work is easily done and costs but little.

STRAWBERRIES.

Strawberries may be set in this month and if they were started in small pots, or if they are on good land and watered when the weather is dry, they will produce a good crop next spring. In any case it will hardly ever pay to set strawberries on poor land or on land poorly prepared.

TRIMMING EVERGREENS.

Perhaps it is best to trim evergreens in spring, but that time of year is over-crowded with work. Cut them back now. Shear off the ends of straggling branches; cut off the tops where they run up thin or spindling. In some places they may be allowed to grow in their natural shape, but in most cases, the frequent use of the knife will improve an evergreen or cause it to take on a form which will best please a majority of people.

CARE OF STOCK.

Domestic animals need watching. They should all be kept in a thrifty condition, and young stock should grow all the time. Bucks should be examined for maggots about the horns. They should be fed a little grain. Feed stock some freshly mown grass or corn, or rye or grain, if the pasture is short, or else buy or hire more pasture, or sell off part of the stock. Look especially after lambs, colts and calves. See them often and handle them. Calves and colts should be well broken to the halter when young. Feed swine well. We know several farmers who always begin feeding considerable grain to swine in August. They have a stock of old corn left over for this purpose. The animals take on fat very readily at this time. A pound of corn will make more pork in warm weather than in cold. Again, it is often the case that swine can be sold to the best advantage early in the season. If started early they will be ready early. Of course, swine may be over-crowded in August, but those which are to be butchered in autumn should be started early.

Look to the supply of water in pastures. Do not trust to swamps and low stagnant water, but dig good wells, unless running water is plenty. Remember not to dig wells on the lower side of a barn-yard, where the water will soon become unfit for use. Much of the water, poor as well as the good, soon finds its way into the blood of animals, and from the blood to the milk, in case of cows. Even living germs have been traced through this course. Who wants to drink milk from cows which have drank impure water?

SEASONABLE HINTS.

Apple-tree Borers.—Every one who owns an orchard, or even a single tree, should now be looking after the borers, to see that their trees are not destroyed. If taken early, it is not a very hard task to destroy the pests by the use of a pocket-knife and wire.

Thinning Fruit.—On small trees, at least, fruit should be thinned out so as not to injure the vitality of the tree by its over-bearing; and on large trees, too, it is advisable; for the fruit that is left on the tree will be very much larger and every way nicer, than if it were all left on to mature.

Pruning.—Now is a good time to cut off all suckers from the trees, and remove all superfluous limbs, if it was not attended to earlier in the season; and where large limbs are removed, it is always a good plan to apply a good coat of paint to the wound. Grafts which were set last spring should now receive prompt attention, and if more are growing than is desirable, they should be removed.

Turnips.—It is not too late to sow those for stock-feeding purposes, although I have had better satisfaction with early than late sowing; and as a general thing, I believe farmers do not sow their turnips early enough.

The Garden.—This plot of ground is often sadly neglected at this season of the year, when haying and harvesting are requiring the attention of all hands, but it should not be so, for in the summer season, when we can get green vegetables fresh from the garden, it should by all means be attended to, and the weeds kept from growing. As a rule, the garden is not appreciated by the farmer as it ought to be.

Water for Stock.—This matter should be atttended to by all owners of stock, to see that they have a good supply of fresh water at all times; for in hot weather it often happens that stock suffer for the want of water. I have often seen cows obliged to drink out of a dirty mud-hole, when by a little labor they might have had good water to drink out of a trough. Is it not strange why some men are so slack about important matters?

Draining.—Immediately after haying is a fine time to drain wet land, and there are but few farms that do not embrace more or less land which could be greatly improved by draining, and it would pay a big interest to do it. It is hard work though to make some farmers believe it. I have seen some of them lay out sums of money in some speculation or other business, and not get one-fourth of one per cent. on the amount invested, when if it had been put into ditches and clearing the fields of stumps and stones, it would have paid ten per cent. Why is it they do not have more confidence in the soil? If the land will not pay for improving it, why not sell it and get the money into something else that they will have more faith in?

Meadowbrook Farm, July, 1878. F. H. D.

ENCOURAGE HOME MANUFACTURES.

Insomuch as the farmer increases the density of the population near him, he enhances the value of his farm, and this in a two-fold ratio. The land itself is more valuable, while whatever the farmer has to sell finds a more ready market and at a higher price. Added to this, he sees the advantages of a greater intelligence near him, sees more people and more wealth to bear the expense of public improvements, can have better roads, more direct communication, better schools and advantages for his children, and life becomes in part the recreation of civilization, and not a mere ignorant, uncouth backwoods drudgery.

If there is a water-fall near-by, or some parties can be encouraged to put up steam for a grist-mill, a saw-mill, planing-mill, or carriage factory or for any of the larger industrial operations, no time should be lost in putting the new industry into operation. Every new manufacture and the addition of every new industry not only give greater employment and wealth, but the presence of these enables the farmer to find a market for a great variety of productions at a better profit than can be obtained from growing one or two great crops and sending them to distant points to market. A single acre of vegetables, carefully attended to, and near a town or village, will bring more profit than ten or even twenty acres of corn and wheat, and while raising these vegetables for sale the household can be better furnished, and with a very large proportion of all the food and that most necessary for health.

The parts of the United States where little manufactories have been from time to time established and have grown to be great ones, employing many hands and consuming a great deal of the farmers' products, are the wealthiest and the farms are worth double what they would be without this denser population.

There is but one way in which a farmer can increase the value of his farm as fast, and that is by increasing its fertility and productive power, but the increasing population enables him to increase that fertility to a better advantage, and gives a double value to his improvements. The true interest of the farmer is to have as much of his products consumed near by him as possible, and to have as much of his necessities produced near by him. It not only keeps wealth but brings more.

Field Crops.

TOBACCO CULTURE IN NEW ENGLAND.—No. 1.

The tobacco plant is a native of America, the discovery of the continent and the plant occurring almost simultaneously. It is a tropical plant but grows freely in temperate climes, but requires high culture and unlimited care on the part of the grower from seed-sowing until harvesting. Its culture first began in Virginia as early as 1616, and in 1634 we find the Puritans testing the "sovereign weed" in the Plymouth Colony. In 1757, it was the custom in the various towns in Connecticut and Massachusetts to appoint packers of tobacco, prizing it in hogsheads, the method then employed in "putting up" tobacco. Now all the tobacco grown in New England is packed in cases of from 375 to 400 pounds. About 1835 tobacco growing in the famous tobacco-growing section in the Connecticut Valley—comprising three counties in Connecticut and two or three in Massachusetts—received a fresh impetus which has continued until now. The plant also is being raised quite extensively in the Housatonic Valley, and is also cultivated to some extent in New Hampshire and Vermont. Connecticut and Massachusetts, however, are the great tobacco-growing States of New England, and together with 13 other States, furnish most of the amount grown in this country.

The variety grown in New England is known as "Connecticut seed-leaf," and is justly regarded as the finest cigar leaf wrapper grown in America. In this respect it has no successful rival so far as texture of leaf is considered. Its color ordinarily is a light cinnamon hue, and sometimes dark cinnamon. Of late the demand has been for dark-colored leaf, and in consequence the growers have tried every means within their power to raise a leaf tobacco suitable for the manufacture of "Maduro" cigars. In New England, beyond all question, the art of raising fine tobacco is better understood than in any other part of the world. When war prices prevailed, fine wrappers sold at from 40 to 60 cents per pound, while at present the growers of the Valley realize only from 10 to 12 cents for wrappers. The finest tobacco is grown in Hartford county in the light sandy soil at a little distance from the river. The soil and atmosphere seem well adapted for fine silky leaves of light color and great strength. At this point the plants get a sufficient quantity of atmospheric salt, but further down the river they get too much, while they don't get enough towards the source of the Connecticut. The experiment has been tried of cultivating the plants near the Sound, but the leaves are too thick and leathery to be of any value for cigar wrappers. Unlike the Southern and Western planters, New England growers select old fields instead of "new land," and I do not remember to have seen in all the Valley but one field of tobacco planted on new cleared land.

In order to raise a leaf of fine texture free from large veins, and of large size, the soil requires very high fertilizing by the application of manure well decomposed. Cigar-leaf tobacco

differs in this respect from cutting leaf (for chewing) or snuff leaf. When tobacco designed for cigars is grown in poor land, the leaves are usually small and frequently as yellow as saffron. It is therefore impossible to grow a fine cigar leaf on soil devoid of fertility. In Massachusetts a large amount of Havana seed-tobacco is being grown this season. The plants are grown from seeds imported from Cuba. This variety justly stands at the head of all cigar-leaf tobaccos, and its exportation from the island extends to all parts of the world. It is impossible to grow as fine a quality of leaf in the Valley as in the "Pearl of the Antilles," but we can approximate it rather closely in quality if sufficient pains are taken in securing fresh seed and allowing the plants to thoroughly ripen. Only about half as much can be secured from an acre as of Connecticut seed-leaf, but it sells for double the price, and sometimes fine selections command very high prices. In Massachusetts three-tenths of the growing crop this season are of this variety and its growth is eagerly watched by all of the leaf packers and cigar manufacturers in the country. If tropical varieties of this plant can be grown in the Valley, then unquestionably the growth of Havana seed-tobacco will assume mammoth proportions. Some six years ago its culture began, and now some 1200 acres are in cultivation this season. Our growers are undoubtedly the most progressive cultivators of the plant in America, so much so that of late the seed-leaf growers of Wisconsin have commenced the culture of Havana seed tobacco, which sells at double the rates of ordinary Wisconsin leaf. E. R. Billings.

GROWING BEANS CHEAPLY.

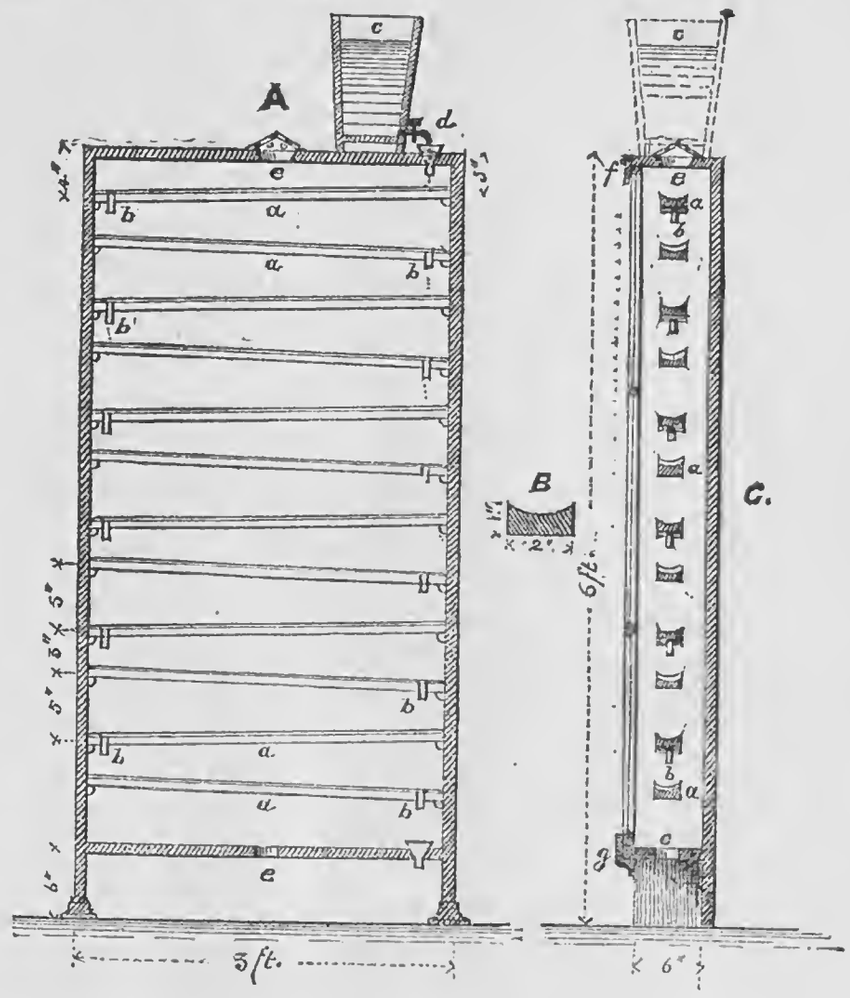
"I won't hoe beans." So said a friend to me a few days ago. I looked up in a little surprise; I had heard the same remark times before, but it was usually the utterance of shiftless farmers who let the crops grow up to weeds through sheer laziness. But I knew my friend for a different kind of man, so I listened respectfully while he continued: "If I can't keep them clean without hoeing I won't grow them. Hoeing beans is a slow, tedious work, and to attend to a bean-crop properly means letting the rest of the farm go with less care than it should." There is a good deal in this. If we can dispense with hoeing for beans, the labor thus saved may be very profitably employed in other farm-work. I have heretofore regarded hoeing as necessary in growing beans, and not only so, but as the cheapest mode of making the crop. What is saved in June and July is more than offset in pulling the crop from among the weeds. But neighbor H. keeps his land clean, and without the use of a hoe. He has his bean rows only twenty-two inches apart, and sown in a continuous drill. This last he considers important as after the first he makes the beans themselves keep down the weeds. He does not plant beans on land where thistles abound—if indeed he is troubled with this pest on his farm. Avoiding stony soil, he drills in a mellow seed-bed, keeping the rows perfectly straight and at the uniform distance of twenty-two or twenty-four inches. For a cultivator, he has what he calls a "bean-scraper"—a piece of thin iron plate about four or five inches wide, sharpened on its lower side and set at a slight angle. This is bolted to a shaft twenty inches high and attached to a light frame with handles. An old shovel-plow makes the best possible frame, removing the shovel-plow irons and substituting the "scraper." This is drawn by a horse walking between the rows, and cutting out the small weeds in the center, at the same time throwing a little loose earth under the bean plants, and effectually smothering weeds on either side. By beginning early, a field of beans may be kept entirely free from weeds with this implement. It is lighter than a cultivator, both for man and horse, and if weeds have not been allowed to grow large, will do as good or better work. Most of the dirt cut up by the scraper falls over its back, and only very little is thrown on either side. If necessary the scraper may be used twice in the row, throwing the dirt to the beans, first on one side and then on the other. After one or two cultivations the beans will shade the ground so completely as to smother the young weeds, except in the center of the rows.

I am satisfied that the implement I have described is a good thing in bean growing; but it needs that the rows should be not more than two feet apart to do perfect work. The ground must also be clear of large weeds and pretty free from stones. Although I use it this year, I am hoeing my beans to take out the few weeds which neither this nor the cultivator can reach. My beans this year are planted wider than I shall plant gain (rows two and one-half feet apart), and there will be some weeds in the rows with the beans, which it is cheaper to brush out with a hoe while young than to allow to grow and mature their seeds. W. J. F.

Monroe Co., N. Y.

RAMIE CULTURE.

The materials for a very large number of profitable new industrial enterprises are lying undeveloped in all parts of the United States; among them that of Ramie cultivation and manufacture, is one of the most interesting and promising. This plant, Bœhmeria nivea, is a perennial, of the nettle family, of the order Urticaceæ, growing to the hight of four feet, and throwing up numerous stems, and as thick as the little finger. It originated in the East Indies, but has been introduced into Jamaica, Mexico, California and Australia, with success, and recently into some of the Gulf States, where



SUMMER PROPAGATION.

the fiber is said to be superior to that produced in China.

Unlike the common nettle, it has no stings, has fertile flowers which, instead of two to five-parted calyx, have a tubular calyx which closely surrounds the small nut-like fruit. It has opposite pointed serrate leaves, six inches long by four inches broad, and long, hairy petioles, the upper surface dark-green and the under surface covered with a white down suggestive of the specific name—nivea—snowy, making the contrasts between the two surfaces very marked. The inconspicuous flowers are in little clusters upon axillary stems.

One species, Bœhmeria cylindrica, a coarse nettle-like wild plant, is native to, and very common in moist, shady places in the United States. Another variety, Bœhmeria tenacissima, is sometimes cultivated, but is a more robust, coarse plant, and the under surface of the leaf is scarcely whitened.

The Ramie plant may be raised from the seed, but the more common practice is to break up and transplant the parts of the old roots. The ground requires to be rich, where the finest fiber is desired to be produced, and well drained, although it stands drought and moisture remarkably, and in California it thrives best where irrigation is practiced. Three crops a year are easily grown in the Gulf States, the second growing quickest, being best, and the yield is 1500 lbs. of fiber to the acre each cutting. The plants are set in rows four to five feet apart, and close together so as to produce slender straight plants. Little care is required after the plants are once set. The crop is cut when the stalks begin to turn brown. At the bottom the useful part is the fiber, or inner bark, and it is stripped from the stems in two long pieces, and cleaned of extraneous matter and dried and assorted according to the character of the fiber.

The greatest drawback to the cultivation is the want of machinery for preparing the fiber for the different uses required; this is done by picking to pieces by hand in the East Indies, and it is a tedious process. The East India Government has offered a prize of $25,000 for the best machine for this purpose, to be presented by September, 1879. The fiber, known as China-grass, has been in use from time immemorial in the production of grass cloth, Japan silk, Nankin linen, Canton goods, etc. Many of these goods have a rich, glossy appearance, equal to silk. The fiber is also largely used in France, England and the United States as a substitute for, or to mix with silk in silk manufacture; and with the prevailing use of jute, instead of or with worsted, in the manufacture of Wilton and Brussels carpets this would, if to be had, take its place as a much more serviceable and durable article; it would also be a substitute for hemp, as it is stronger and finer and more durable than linen, and almost as lustrous as silk, and would enter into the manufacture of these and woolen goods, and mixed with wool to a very large extent. There is no doubt but the Gulf States have it in their power to introduce another fiber to the world, which shall rival cotton in importance and as a source of wealth to the nation.

Farm Economy.

CARE OF VILLAGE REFUSE.

The farmer's greatest want is manure for his exhausted lands. To obtain this economically, near by him, and know its character, that he run no risks, are the all-important necessity. His first resource is the *saving* of everything upon his farm, not merely in returning straw and all kinds of green manure to the land, to be dried up, or burned up in the sun and blown away, but in composting and rotting until it is so dissolved or pulverized, or in other words, "digested," that the roots have nothing to do but to suck up the food they require. When the resources of the barn-yard, the out-houses, and the swamps and woodlands, and roadsides are exhausted, the nearest additional supply is usually at the outskirts of large towns, or in smaller villages, and here the farmer can readily find enough and the best food for his compost heap and for his crops.

The refuse lying around almost any dwelling in the outskirts of towns, especially those of the poorer classes, who do not seem to value the benefits of a healthy atmosphere, of "sweetness and light," will give the farmer ample reward for cleaning up thoroughly and hauling it away, and the inmates will hardly object to the operation.

Of course, there are a great many kinds of refuse which the farmer can obtain if on the lookout for it, some of which from manufacturing establishments, he may have to pay a small sum for, but this is generally better than paying for unknown commercial fertilizers. The organization of scavenger companies should be encouraged by the town authorities of every village or city, and every facility afforded for cleaning the parts of the town not thoroughly cared for by the occupants. Cess-pools and water-closets should be systematically constructed, and so as to allow of the easy application of deodorizers of any kind and a frequent thorough cleaning. This neglect is the great waste of the country at this time, and its perfect utilization is the source of great benefit to exhausted lands as well as of health to the town's people. No other expense of deodorizing is needed than burned peat, or any very dry or burned earth, and that not in large quantities, but just sufficient to render the operation not disagreeable. Any company which could obtain from a city of no more than five thousand inhabitants the exclusive right to clean the city and be authorized so to do, would have the foundation of a profitable business, and would be doing the people of the town as well as the farmers a great benefit.

WASTE OF MANURE ON THE FARM.

The subject of keeping up the fertility of the farm is of interest to every farmer, particularly in the older States of the Union, where many farms are becoming more and more exhausted by constant cropping, without a sufficiency of fertilizing matter being returned to the land. Many thousands of dollars have been expended for artificial fertilizers in these parts, yet only a few farms have been improved in productiveness within the last ten years. Many farmers, since the introduction of the artificial fertilizers, have neglected proper attention to the making and saving of manure about the farm; where, I am satisfied from experience and observation, much more valuable fertilizers can and may readily be made and applied at a less cost, by properly utilizing the waste material about the farm, and by a proper care in preventing waste of the manure after it is made. An observing farmer, let him turn which way he may, can scarcely fail to see the greatest negligence and waste of which the general farmer can be guilty, in the neglect to save and apply fertilizers, or matter that may be turned into such.

A few weeks since I was traveling along a road that was partially covered with hay. For near a quarter of a mile the farmer had carefully mowed the sides of the roadway and raked the grass, weeds, etc., into the middle of the road. The owner of this farm was a young man whom I never saw at a Farmers' Club, and I strongly suspect he is not a subscriber to the Rural. On several other farms I passed, the road-sides were mowed and the grass lying there. In this county stock is not permitted to run at large on the highways, and in many places the grass would be well worth taking to the barn for fodder, and where too many weeds or other rough material are mixed with it for hay, it is well worth gathering for litter and manure, and careful farmers, who take agricultural papers, do utilize it in preference to buying doubtful phosphates.

Pig-pens, with the hogs kept in them the year round, are excellent places to make manure in. Last year I had six pigs in a pen, and I supplied them with all kinds of material for them to work up into fertilizers—leaves from the woods, all sorts of weeds, grass and rubbish from the truck patch and road-sides, potato-tops, straw, etc., and in the fall I drew out eighteen one-horse cart-loads of pretty good manure, although the pens had been cleaned out in early spring of the same year. A neighbor of mine, who buys phosphate, has his pig-pens by the side of a public road, along which I often pass, and I find his pen littered with stones. I never heard of this man taking an agricultural paper, and fear he would not were I to urge him to do so, but I shall try him with the Rural. Many farmers waste a great deal of their manure, after it is made, by exposure in an uncovered barn-yard during summer. S. S.

Floricultural.

ROOTING CUTTINGS IN AUGUST.

The following is a description of my mode of rooting cuttings through the hottest part of the season. It is done in an upright frame the size of a hot-bed sash, and six inches deep. The long sides project about six inches to form feet, and the back is boarded up. In the middle of it are shelves two inches wide, leaving two inches space in front and the same behind. These shelves are slightly hollowed out, gutter-like, to about one inch on either side. In each is a half-inch hole, one a half inch off from one end. These holes are lined with a piece of tube, like bent zinc, protuding one-half inch below. There are also corresponding holes in the top and bottom boards. The shelves are arranged in a sort of slanting manner, the ends diverging from and approaching each other alternately, the explanation being rendered clearer by an inspection of the accompanying cut.

The side with the hole is placed at the lowest end letter. In the middle of each, top and bottom, a two-inch hole serves as ventilator. On the top, a reservoir of water, provided with a faucet, is placed. Any water-tight vessel will answer for this purpose, such as a bucket, keg or kerosene-can. The last of these I employ, and it needs filling-up only twice a week. Two hook-like brackets at the bottom, and a catch above, hold a sash to its place in front of the frame. The whole has to receive a thick coat of paint. It is placed perfectly level on the north side of a building. Thumb-pots containing clear sand, with their holes stopped up with clear wax, are placed all along the shelves.

In these pots the cuttings are inserted. Water is put in the vessel and the faucet opened wide enough to allow, about every second, a drop of water to escape. This falls through the top to the first shelf, runs down to the lower end, from this through the zinc tube to the next shelf, etc., to the bottom, keeping, in its course, all the pots moist which in turn suck up the moisture and impart it to the sand. This procedure, when once started, needs no further attention, except putting in cuttings, taking them out when rooted, and filling up the vessel once or twice a week. The cuttings never flag or wilt; a free circulation of air is about them, and no fungoid growth causes their damping off. The shoots are taken when of the same degree of maturity at which florists generally root them in their heated sand-beds in propagation houses. If possible, no leaves ought to be taken off, except those which would reach in the sand. This method is only applicable when the temperature is above 75°. A frame three by six feet will hold from 250 to 300 cuttings.

In the sketch *A* is front elevation; *a*, shelves; *b*, zinc tubes; *c*, reservoir; *d*, faucet, *e*, place for air holes; *f*, catch to hold the sash to its place; *B*, cross-section of shelves; *C*, sides; *g*, brackets to support the sash. One end of the uppermost shelf is three inches from the top, the other four. All the other shelves are alternately three by five inches from each other.

SALIX LUCIDA?

A Note From Mr. Downing.

In your article on the Salix laurifolia, you say the specific name is not authorized, and that you have not found it even as a synomyn. Mr. LOUDON, in his Aboretum Britannicum, describes between two and three hundred varieties of the Willow, and gives outlines of many of them, and among them is S. laurina, the laurel-leaved or shining dark-green Willow," which he says is "a shrub or small tree attaining the hight of six feet, and if neglected becomes a small tree; the twigs are very brittle and unfit for any useful purpose." Of course, this can not be what we have as S. laurifolia which grows three times that hight, and is probably what Mr. LOUDON describes as S. pentandra, as the description agrees pretty nearly and they may prove identical, and if what I received as such were correct, I think they are. Salix lucida and S. Meyeriana, as described by LOUDON, are very similar to S. pentandra, so much as to require to be grown side by side to come to a correct decision. The S. laurifolia, as we have it, is very beautiful when grown as single specimens on the lawn as a tree of medium size, especially when the young shoots are cut back annually nearly of their last season's growth. It is also useful when planted in a bed to be cut back annually for sticks or rods for florists and nurserymen. They should be cut of suitable lengths, and tied closely together in small bundles until they are sufficiently dried to prevent their growing, when they make the best of rods for this purpose, and a small plot will give a large number from a half inch in diameter to the smallest size, and when cut down annually they grow from five to ten feet high; cuttings strike easily and grow vigorously in almost any uplaud soil.

Horticultural.

TRANSPLANTING CABBAGE, ETC.

ISAAC F. TILLINGHAST.

THERE is still time in many localities to put out cabbage and celery plants for winter and spring use. So far as I can judge from personal observation in my own locality, from correspondence with my patrons in various sections, and from the demand for seeds and plants, compared with that in other years, the acreage of cabbage for late use this season is very much less than at any time during the past ten years. The cause of this is, that the business was entirely overdone last season and the market was glutted, prices ruling so extremely low that cultivators were disgusted with the very name of cabbage. The result will be a scarcity the coming winter, with fairer prices, which will stimulate to renewed exertion another year. But those who make the money are those who produce an article in times of scarcity. Many persons think they cannot safely transplant succulent plants, like cabbage and celery, successfully during the hot, dry months of midsummer. Of course, it can be more easily accomplished when the weather is cool and cloudy, and the ground moist, but by observing the following points, I have had no difficulty in accomplishing it at any time, no matter how hot the weather may be. When removed from the seed-bed, many of the fine rootlets are broken, and the supply of moisture cut off. The first tendency of the plant is then to wilt and perish, particularly if the leaves are exposed to the sun, so that evaporation goes on rapidly. Therefore, if transplanted at once after being removed from the bed on a hot day, the chances are that it will die. But dip the roots in water and place the plants loosely in a cool place where they may be shaded from the sun, but not shut out from daylight, for 24 or 36 hours, and an abundance of new, white rootlets will be formed. The whole plant will have a fresh, vigorous look, as though it had determined to live and grow despite its removal. All its reviving forces are now at work, it is convalescent, and with half a chance, it will rapidly recover. Now remove a few of the larger leaves, that the evaporation of moisture may not be greater than the new roots can supply and "puddle" the roots. This is done by stirring fine garden soil into a pail of water, until it is of the consistency of thick cream. Dip the roots, a few at a time, into this, until a heavy coating adheres to them. A slight sprinkling of dry gypsum or "plaster" will admirably serve to retain the moisture, though too heavy a coating will sometimes bake so hard as to effect more harm than benefit. If the plant is now set in newly-plowed soil, it will live and commence growing immediately, no matter how hot and dry the weather may be. As it is not always convenient to plow the ground just before setting the plants, the fresh moist condition may be attained by ridging it up with a horse-hoe or corn plow, and raking or hoeing down the ridges immediately before setting the plants. When managed in this manner, transplanting may nearly always be made a successful operation. Still, if convenient to put the plants out in the after part of the day, they will get accustomed to their new quarters during the cool hours of night and not mind the sun's rays the following day.

I have frequently put out cabbage plants so late in the season that the heads became but half-formed when winter set in. Just before the ground freezes, a deep furrow is plowed on some dry sandy knoll, the cabbages are carefully lifted and set as thickly as convenient in the furrow in their natural position, with the soil adhering to the roots. The furrow is then covered with three or four inches of dry straw, and this in turn with about the same thickness of soil, which can mostly be done by running a plow along each side and forming a ridge above the straw. The formation of the head will go on during the winter to nearly the extent that it would had the season been prolonged. They will come out in spring white and tender and be greatly relished because of their scarcity. Cabbages to do well should be hoed frequently. The soil around them should be loosened as often as the showers pack it down.

This matter of freqnent cultivation will apply to nearly all vegetables with nearly equal force. It is actually less work to hoe a field as often as a weed can be seen than to allow them to get the start of you and then try to conquer. This is a lesson I have learned many times and yet I confess the weeds occasionally get the better of me. It is so much easier to keep square with this world in all respects than to catch up after once getting behind.

Wyoming Co., Pa., July 20, 1878.

The Vineyard.

GRAFTING GRAPE-VINES AGAIN.

BUT for an error in your issue of 13th inst., under the above head, I should have let this subject remain where I then left it. To those who do not know the difference in the histories, the advents, the size and the qualities of the two grapes—the *Isabella* and the *Israella*—my article of the 13th is well enough as it is, as it merely shows the liability of the stronger stock to eventually obliterate the weaker cion, and that the vine that once produced red fruit may eventually produce black. In the manuscript of the article alluded to, the word *Isabella* did not occur, while in the printed article it occurs seven or more times.

The practical grape-grower doubtless knows that the Iona and the Israella originated some fifteen years since, with C. W. GRANT, near Peekskill, N. Y., and that the Isabella is one of the two oldest varieties under general cultivation in the Northern States. The Israella is claimed by the originator to be a seedling from the Isabella, which it has every appearance of being; and while I am on the subject I venture to express my own experience of the two; that the former is no improvement upon its parent, except that it ripens some ten to fifteen days earlier, while at the same time it lacks the size, vigor, hardiness and productiveness of the parent. Of the liability to disease of either I cannot say much, for here we are not troubled with mildew or rot. All the disease I have ever seen here is a few dark-colored spots on the Ionas, Northern Muscadines and Franklins, which have more effect to disfigure them than to do any material injury.

My experience in grapes is confined to this eastern shore of Lake Michigan, where I have cultivated a few for the past eighteen years, and I am aware that different altitudes, climates and soils, may produce different results in many varieties. The object of this article is not to censure either the type-setter or the proof reader, whom I have found praiseworthily correct; the error is a very natural one with the typo who is not skilled in grape nomenclature, but I feared that some of the RURAL readers might think me foolish or ignorant for paying two and a half dollars each for Isabella grape-vines in 1866, neither of which charges do I admit to have been then, or to be now, true.

Fear of spinning out too long an article, and the fact that the mercury stands 88 in the shade at 2 P. M., hinder me from giving an account of the present grape prospects, which, in ordinary exposures, is not flattering but somewhat instructive.

S. B. PECK.

Miscellaneous

WHAT OTHERS SAY.

RUST.—The Pacific Rural Press (San Francisco) says: Now that the fields come to the test of the reaper, it is seen that nearly everywhere there is severe damage from rust. From the severe visitation in the Salinas valley, the evil extends north and south and eastwards, making some fields wholly unworthy of the harvester, and in others leaving naught but small weights of shrunken and shriveled grain. Sad indeed will be the consequences to many an honest worker, who, surviving the drought last year, put all his labor, his cash, his credit, and his hopes into this year's promise of plenty, and will hardly reap enough to nourish his family through the year.

COL. COLMAN (Colman's Rural World) says that just at this time, when the cheese market is depressed, it is a good opportunity to impress upon cheese-makers the importance of cultivating a demand for cheese in all our rural homes. Not one-fourth of the cheese is consumed which should be. In this respect we are not advocating more costly or extravagant living. But substitute good rich cheese for many of the injurious but fashionable articles now so often on our tables. Cheese can seldom be found in the houses of our common small farmers, for the reason that it cannot be had at consumption prices nor in a state to suit the demand.

MILLET AND BARLEY.—The New England Farmer says that if millet can be sown by the 20th of July, on rich mellow land free from weeds, and the season is favorable to immediate and rapid growth, a good crop may be expected, but if any of these conditions are wanting a failure must result. From present experiences we should recommend barley for very late sowing instead of either variety of millet. Barley will bear colder weather, is not easily injured by light frosts, and it makes a very good quality of fodder, either for feeding green or cured for hay. Millet is somewhat subject to rust, if sown very late after the nights begin to grow cool.

LUCK.—It is not luck says the Weekly Globe (Canada), but labor that makes men. "Luck," says an able writer whose name we know not, "is ever waiting for something to turn up: labor, with keen eye and streng will, always turns up something. Luck lies in bed and wishes the postman would bring him news of a legacy: labor turns out at six, and with busy pen or ringing hammer lays the foundation of a competence. Luck whines; labor whistles. Luck relies on chance; labor on character. Luck slips downward to self-indulgence: labor strikes boldly upward, and aspires to independence."

WATER FOR STOCK.—The Mass. Ploughman remarks, in a sensible article upon this subject, that cows may live if only watered night and morning at the barn yard, but it is not a normal mode of living. If any one will notice cows while grazing near a brook or spring, he will find that they drink half a dozen times in a day, and this is far better for them than to distend themselves, like an inflated bladder, night and morning.

THE TRUE FEAST.—The Phrenological Journal says that when the barbarous practice of stuffing one's guests shall have been abolished, a social gathering will not necessarily imply hard labor and dyspepsia. Perhaps, when that time arrives, we shall be sufficiently civilized to demand pleasures of a higher sort. True, the entertainments will then, in one sense, be more costly, as culture costs more than cake.

CABBAGE WORMS.—A writer in the Weekly Tribune says that he hunted last year cabbage-worms till he nearly crippled his back. One day a neighbor's wife came in and told him to use a tea made of cayenne pepper to sprinkle the cabbages with twice a day. He applied it, and his cabbages and back were saved. He watched the millers, and they would not light on the plants which had the pepper on them.

NITROGEN FROM THE AIR.—Mr. J. B. LAWES says, in the North British Agriculturist, that though it has often been said that broad leaves, such as the root crops possess, obtain the nitrogen from the atmosphere; yet he has no reason to think that such is the case.

RATS.—The American Poultry Journal says that it costs as much to feed the rats and mice of our country as it does to feed our poor, and even more.

Industrial Societies.

ANNUAL FAIR LIST.

THE following partial list of State and Local Fairs will be supplemented as fast as trustworthy advices are received. Corrections and alterations of dates previously announced and published have delayed the list slightly:

STATE AND GENERAL

American Institute, New York	Sept. 11, Nov. 23
California, Sacramento	Sept. 16, 21
Colorado, Denver	Sept. 21, 28
Connecticut, Hartford	Sept. 10, 13
Dakota, ——	Sept. 10, 13
Georgia, Macon	Oct. 28, Nov. 2
Illinois, Freeport	Sept. 16, 21
Indiana, Indianapolis	Sept. 30, Oct. 5
Inter-State, Chicago	Sept. 4, Oct. 19
Iowa, Cedar Rapids	Sept. 16, 20
Kansas City Exposition, Kansas City	Sept. 16, 21
Kentucky, Lexington	Aug. 27, 31
Maine, Portland	Sept. 17, 20
Mechanics' Institute, San Francisco, Cal.	Aug. 13, Sep. 14
Michigan, Detroit	Sept. 16, 20
Maryland, Pimlico	Sept. 24, 27
Minnesota, St. Paul	Sept. 2, 7
Missouri, Madison	Sept. 9, 13
Montana, Helena	Sept. 23, 29
Nebraska, Lincoln	Sept. 23, 27
Nevada, Reno	Oct. 7, 12
New England, Worcester, Mass	Sept. 3, 6
New Jersey, Waverley	Sept. 16, 20
New Jersey Horticultural, Mt. Holly	Oct. 8, 10
New York, Elmira	Sept. 9, 13
Northwestern Agricultural and Mechanics' Association, Dubuque, Iowa	Sep. 9, 13
Ohio, Columbus	Sept. 9, 13
Ohio Central, Mechanicsburg	Sep. 3, 6
Ohio Southern, Dayton	Sep. 23, 27
Oregon, Salem	Oct. 8, 18
Pennsylvania, Erie	Sept. 23, 27
St. Louis Association, St. Louis, Mo	Oct. 7, 12
Southern Cala. Agricultural and Horticultural, Los Angeles	Oct. 14, 19
Southwestern Wisconsin, Industrial Association, Mineral Point	Sep. 3, 6
Texas, Austin	Oct. 29, Nov. 2
Texas Southern, Houston	Oct. 22, 26
Vermont, St. Albans	Sept. 10, 12
Virginia, Richmond	Oct. 29, Nov. 1
Wisconsin, Madison	Sept. 9, 13

COUNTY AND LOCAL.

CALIFORNIA.

El Dorado, Placerville	Sep. 13, 15
Golden Gate, Oakland	Sep. 9, 16
Marin, Petaluma	Sep. 23, 28
Monterey, Salinas City	Oct. 15, 19
Napa, Vallejo	Sep. 3
Northern District, Marysville	Sep. 24, 28
Santa Clara, San Jose	Sep. 30, Oct. 5
San Joaquin Valley, Stockton	Sep. 24, 28
Stanislaus Stock Growers, Modesto	Oct. 9, 11
Solano, Vallejo	Sep. 3
Siskiyou, Yreka	Oct. 2, 5
Sonoma, Petaluma	Sep. 23, 28

COLORADO.

Boulder, Boulder City	Oct. 2, 5

CONNECTICUT.

Windham, Brooklyn	Sep. 24

ILLINOIS.

Adams, Camp Point	Sep. 2, 6
Adams, Quincy	Sep. 24, 27
Boone, Belvidere	Sep. 3, 6
Brown, Mt. Sterling	Sep. 17, 20
Bureau, Bureau	Sep. 3, 6
Carroll, Mt. Carroll	Aug. 27, 30
Cass, Virginia	Aug. 27, 30
Champaign, Champaign	Sep. 3, 6
Christian, Taylorville	Sep. 17, 20
Clay, Louisville	Oct. 8, 11
Clay, Flora	Sep. 24, 27
Coles, Charleston	Sep. 17, 21
Crawford, Robinson	Oct. 8, 11
Cumberland, Majority Point	Sep. 25, 28
DeKalb, Sandwich	Sep. 10, 13
DeKalb, Sycamore	Sep. 24, 27
DeKalb, DeKalb	Sep. 11, 13
De Witt, Clinton	Aug. 20, 23
DeWitt, Farmer City	Aug. 26, 30
Douglas, Tuscola	Sep. 10, 14
DuPage, Wheaton	Sep. 11, 13
Edgar, Paris	Sep. 3, 6
Edwards, Albion	Oct. 1, 4
Fayette, Vandalia	Oct. 2, 5
Ford, Paxton	Sep. 10, 13
Ford, Gibson City	Aug. 20, 23
Franklin, Benton	Sep. 24, 27
Fulton, Canton	Sep. 3, 6
Fulton, Avon	Sep 24, 27
Gallatin, Shawneetown	Oct. 1, 5
Greene, Carrollton	Oct. 1, 4
Grundy, Morris	Sep. 24, 27
Hardin, Elizabethtown	Sep. 18, 21
Henderson, Biggsville	Sep. 17, 20
Henry, Cambridge	Aug. 26, 30
Iroquois, Onarga	Sep. 2, 7
Jackson, Murphysboro	Sep. 10, 13
Jasper, Newton	Sep. 24, 27
Jefferson, Mt. Vernon	Oct. 8, 11
Jersey, Jerseyville	Oct. 15, 18
Jo Daviess, Galena	Sep. 24, 27
Jo Daviess, Warren	Sep. 24, 27
Kane, Aurora	Sep. 3, 6
Kankakee, Kankakee	Sep. 24, 27
Kendall, Bristol	Sep. 10, 12
Knox, Knoxville	Sep. 17, 20
Lake, Waukegan	Sep. 23, 28
LaSalle, Ottawa	Sep. 2, 6
Lawrence, Lawrenceville	Oct. 2, 5
Livingston, Pontiac	Sep. 2, 7
Livingston, Fairbury	Sep. 10, 13
Logan, Lincoln	Aug. 26, 31
Logan, Atlanta	Aug. 19, 23
Macon, Decatur	Sep. 30, Oct. 4
Macoupin, Carlinville	Sep. 30, Oct. 4
Marion, Centralia	Oct. 1, 4
Marshall, Henry	No report
Marshall, Wenona	Sep. 23, 27
Mason, Havana	Sep. 17, 20
Massac, Metropolis	Oct. 9, 11
McDonough, Macomb	Aug. 27, 31
McHenry, Woodstock	Sep. 21, 27
McHenry, Marengo	Sep. 10, 13
McLean, Bloomington	Sep. 3, 6
Menard, Petersburg	Sep. 3, 6
Mercer, Aledo	Sep. 24, 27
Montgomery, Hillsboro	Oct. 2, 4
Montgomery, Litchfield	Oct. 15, 18
Morgan, Jacksonville	Sep. 10, 13
Moultrie, Sullivan	Sep. 10, 14
Ogle, Oregon	Sep. 3, 6
Ogle, Rochelle	Sep. 23, 26
Peoria, Peoria	Sep. 10, 13
Perry, Pinckneyville	Oct. 2, 4
Piatt, Monticello	Aug. 20, 23
Pike, Pittsfield	Sep. 24
Pope, Golconda	Oct. 3, 5
Putnam, Hennepin	Sep. 10, 12
Randolph, Sparta	Sep. 25, 27
Randolph, Chester	Oct. 15, 18
Richland, Olney	Sep. 17, 20
Rock Island, Hillsdale	Sep. 17, 19
Saline, Harrisburg	No report
Sangamon, Springfield	Sep. 23, 27
Schuyler, Rushville	Sep. 24, 27
Stark, Toulon	Sep 24, 28
St Clair, Belleville	No report
Stephenson, Freeport	(State Fair)
Tazewell, Pekin	No report
Union, Jonesboro	Sep. 10, 13
Vermilion, Catlin	Sep. 10, 13
Vermilion Hoopeston	Aug. 27, 30
Vermilion, Danville	Sep. 16, 20
Wabash, Mount Carmel	Sep. 30, Oct. 3
Warren, Monmouth	Sep. 10, 13
Wayne, Fairfield	Sep. 17, 20
Whiteside, Sterling	Sep. 24, 27
Whiteside, Albany	Sep. 11, 13
Whiteside, Morrison	Sep. 3, 6
Will, Joliet	Sep. 9, 13
Williamson, Marion	Oct. 1, 4
Winnebago, Rockford	Sep. 10, 13

Fairs will also be held at Marshall (Clark Co.,) Carlyle (Clinton Co.,) McLeansboro (Hamilton Co.,) Carthage (Hancock Co.,) Libertyville (Lake Co.,) Amboy (Lee Co.,) Salem (Marion Co.,) Waterloo (Monroe Co.,) Shelbyville (Shelby Co.,) and Cazenovia (Woodford Co.)

INDIANA.

Allen, Fort Wayne	Sep. 9, 13
Bartholomew, Columbus	Aug. 27, 31
Blackford, Hartford	Sep. 24, 27
Boone, Lebanon	Sep. 9, 13
Cass, Logansport	Sep. 24, 28
Carroll, Delphi	Sep. 23, 27
Clinton, Frankfort	Sep. 16, 20
Clark, Charlestown	Sep. 10, 13
Decatur, Greensburg	Aug. 20, 23
Delaware, Muncie	Sep. 10, 13
Elkhart, Goshen	Sep. 1, 4
Fayette, Connersville	Sep. 5, 6

Industrial Implements.

THE EUREKA SAFETY-POWER.

We illustrate this week the engine and boiler that scored the first prize in the second-class, at the trial of steam engines under the auspices of the New York State Agricultural Society in Syracuse, November, 1877.

This was, perhaps, one of the most exhaustive, scientific tests that it has been the fortune of farmers to have had made in their interests, and it would be well worth the while of gentlemen who can comprehend the value and importance of such tests (among whom we include our readers), to send to the Secretary of the Society for the Report. We condense from its pages some of the most important conclusions concerning the "Eureka," arrived at by Messrs. D. M. Greene and Henry Waterman, the experts who directed the trial. The totals are reckoned in percentages, and the items will show what qualities of the boiler were tested. It is flattering to the builders of the "Eureka," Messrs. B. W. Payne & Sons, Corning, N. Y., that the result of the test should so closely coincide with the testimony of purchasers of the engine as to its power, utility and endurance. We give the figures without further preface, merely premising that the construction of the "Eureka" reduces danger from explosion to a cipher.

Weight of engine, 1,500 lbs.; price, $250; horse power, rated 4; diameter of cylinder, 4 in.; dimension of grate, 14⅜ in. diameter; fire-box, 18 in. high; volume of water space, 2 cubic ft.; steam space, 1.34 cub. ft.; area of heating surface, 56 sq. ft.; ratio of steam to water space, 0.68: ratio of heating to grate surface, 49.12. Duration of trial, 2 hours; coal consumed during trial, 50 lbs.; water evaporated, 400 lbs.; mean steam pressure, 91.06; mean revolutions of engine, 227.06; mean temperature of water delivered to the boiler, 185°.

The deductions of the experts are:—Effective power expended on pump, 2.0 h. p.; expended by engine, 3.265 h. p.; coal per hour consumed, 25 lbs.; consumed per effective horse power expended by engine, 7¼ lbs.; water evaporated per hour, 200 lbs.; evaporated per sq. ft. of heating surface, 3.61; water evaporated per effective h. p. of engine per hour, 61.26 lbs.; water evaporated per lb. of coal, 8 lbs.; rate of effective power of engine to rate power, 0.816.

The main figures are given only, but they will serve to show that with a consumption of about 7¾ lbs. of coal per hour, eight-tenths, or nearly the whole rated horse power, was exerted on the engine, giving a pressure of 91 lbs. on the boiler, and turning the engine at the rate of 227 revolutions per minute.

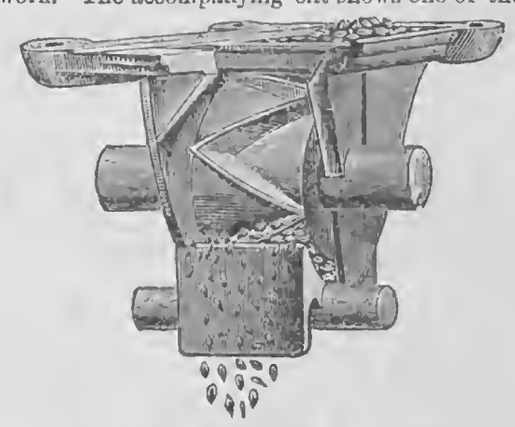
The engine is rated 4 horse power when run 300 revolutions per minute; in the test it developed 3,265 effective h. p., running 227 revolutions; if it had been run at its rated speed it would have afforded 4⅜ effective horse power. Its economy of fuel is in a small boiler unprotected by any non-conductor.

It must be borne in mind also that the experts limited the amount of steam to be carried to one-fifth the theoretical bursting pressure, which demonstrates that the "Eureka" would, if slightly pushed, exceed the rated power considerably.

THE FARMER'S FRIEND DRILL.

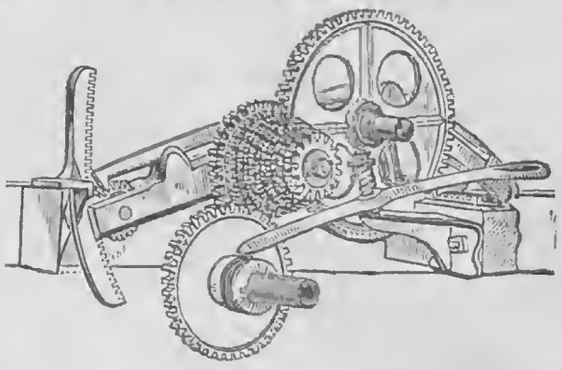
The chief objects to be attained in the making of a drill are the even distribution of the seed in the requisite quantities; a simple and thorough contrivance for covering; an apparatus that will distribute fertilizers evenly and without clogging; as also attachments for sowing grass or clover seed.

The Farmer's Friend Grain Drill claims to cover these points by patented improvements that we shall explain to our readers as clearly as space will allow. We have chosen for illustration the method of securing a positive or force-feed, and the means employed to change this feed at will, without stopping the drill while at work. The accompanying cut shows one of the



feed-cups, and the roller with its eight zigzag ribs. Each alternate rib runs in an opposite direction. During the revolution of this roller the grain drops into the feed cups, and in the delivery the seed is forced out from both sides of the cup, and a regular, even distribution secured. So admirable is this arrangement that at the Centennial Field trials, where the various drills were put to tests that would rarely if ever occur in practical agriculture, the Farmer's Friend varied but a trifle in the distribution of seed from the cups, and was warmly commended for this valuable characteristic.

The feed-rollers are fixed on a central shaft, revolving uniformly, and the rate at which the roller turns determines the quantity of seed sown. The device for controlling the quantity of seed to be sown is a most important improvement. The different sized gear wheels necessary for varying the rate of seed discharge, are bolted in a cone, and the changes are made by merely shifting a lever, which moves over a notched plate. Upon the latter is shown in figures the quantitiy of seed per acre which each wheel will sow. The accompanying cut shows this simple



mechanism, the cone gearing. By it the amount of seed is perfectly under the control of the driver, and may be varied in an instant without stopping the drill or the discharge of grain. This alone is a great gain.

The arrangement by which the alternate hoes can be set forward seven or eight inches, and thus present a broken line, with more space for the passage of clods, stones, or weeds, is not desirable when the soil is in a favorable condition, because the closer the hoes are the more will they act as harrows in breaking and pulverizing the surface; but when the land is new, stony, or badly cleared, the zigzig method of arrangement has its uses. In such conditions the precautions taken for preventing breakage, and consequent imperfect work of the hoes, are effective.

Where the soil is rocky, with large or fixed stones at or near the surface, a spring hoe is of great advantage.

The lower portion of the hoe-frame is hinged, so that in the event of coming in contact with a post, stone, or tree-root, the hoe flies back and accident is avoided. As soon as the machine is set free from obstruction, the hoe, acted upon by a powerful rubber spring, flies back into its place. This is a very perfect and ingenious arrangement. Then either in front of or behind the seed-box is placed a small seed-distributer, driven from the main wheel by a crank. With this the grass-seeds, clover and timothy can be sown at the same time as the grain.

The method of fastening the rubber tube that conveys each seed discharge to its respective box, is simple and durable. On the bottom of the feed-cup are two projecting arms, and the tube hooks over these, and fastens itself; so it can only get off when removed by the hand. No spring, bolt, or pin is used, yet the fixture is complete, at the same time permitting the tubes to be taken off and put in the hopper in an instant, and as quickly replaced.

The various attachments of minor import, such as land measurer, etc., are included in the equipment of the drill, adding to its perfect working without materially affecting the important points.

As regards construction, the machines are strong, durable, well-balanced, and adapted to the purpose for which they are made. The main points are those which we have dwelt upon. The saving of grain, uniformity and certainty in distribution, and convenience in changing gears.

The Farmer's Friend Mf'g Co., Dayton, Ohio, make the drill, and will supply particulars to those wishing to go more fully into its merits.

The Querist.

ANSWERS TO CORRESPONDENTS.

Grasses.

J. P. Corbin, Broome Co., N. Y., sends 16 samples of grasses and asks their names as numbered, together with the merits or demerits of each. He sowed different kinds of seed from their reputation, but cannot tell one from the other, nor does he know their respective qualities.

ANS. No 1. Anthoxanthum odoratum, Sweet-scented Vernal Grass. Naturalized from Europe. One of the earliest in spring and latest in autumn. The plant may be known by its perfume when pressed between the fingers. It is valuable for its early growth chiefly.

No. 2. Festuca nutans, the Nodding Fescue.

No. 3. Bromus secalinus, Chess or Cheat. This valuable to some agricultural editors and writers as affording a standing topic of controversy. There are as many as two or three persons about the country that yet contend that Wheat turns to Chess. While this is so the controversy must go on.

4. 8. 9. Different forms of Agrostis vulgaris, Redtop, Rhode Island Bent, and in the South Herd's Grass. It was formerly called English Grass. Its first value is in its permanence as a pasture grass. It does not yield as largely as Timothy.

5. Holcus lanatus. Velvet Grass, Meadow Soft Grass. This is of little value, cattle not caring for it. It readily spreads when once introduced as the seeds are light, but is not worth cultivating except where other grasses will not grow.

6. Dactylis glomerata. Orchard-Grass, Rough Cock's-foot. Palatable to stock of all kinds and one of the most valuable of all the pasture grasses. See article of PROFESSOR BEAL next week.

7. Poa. We cannot determine the species from the delapidated specimen. 10. is also Holcus lanatus.

11. Lolium. Cannot determine species from specimen.

12. 13. Trifolium. Common Red Clover.

14. Trifolium incarnatum (Crimson C.) This is a very pretty Italian Clover and valuable for soiling or hay. It is largely cultivated in Scotland.

15. Medicago sativa: Alfalfa, Lucern. The yield is abundant and of fine quality in warm deep soils. Suited to Southern States. Its roots grow deep in the ground and the plant therefore stands droughts.

16. Trifolium agrarium. Yellow or Hop Clover.

Manure Ingredients.

R. Saunders, Essex Co., Va., has some sandy and clay-loam land rendered poor by years of neglect, so that there is little grass on it. He wishes to sow it to clover and timothy, but has not enough of barn-yard manure for this patch and for his good land also. He has tried some chemical fertilizers with poor success, and asks for a recipe for mixing the ingredients of a complete manure suitable to this soil, as he has learnt that in this way he would be more likely to get a trustworthy article, while there would be a saving on the cost of materials and transportation.

ANS.—Without knowing the needs of the soil we cannot give such recipe. The following table will show the average composition of 1000 pounds of timothy and clover:

	Water.	Organic Matter.	Mineral Matter.	Nitrogen.	ASH.						
					Potash.	Soda.	Lime.	Magnesia.	Phos. Acid.	Sulp. Acid.	Silica.
Tim'y.	143	794	62.	15.5	20.4	1.5	4.6	1.9	7.2	1.8	22.
R. Cl'r	160	800	39.	24.	11.	1.2	13.5	5.0	4.0	1.6	1.6

Possibly plaster alone would, for a time, render the land fertile. It may require potash, phosphoric acid, nitrogen, one or all. Bone if finely pulverized, or dissolved in sulphuric acid, is immediately available in supplying phosphoric acid. But to pulverize it, a bone-mill would be necessary, and to dissolve it in sulphuric acid in a small way is both dangerous and unprofitable to inexperienced workmen. Wood-ashes would furnish potash; and salts of ammonia, nitrate of soda, fish, horn, hair, dried blood, etc., would supply nitrogen.

Very likely the phosphate used was an inferior article. The bulletins of Prof. JOHNSON, which we publish from time to time, will help to determine what establishments throughout the country sell fertilizers that are, in reality, what they profess to be. Actual fertilizing ingredients have a certain market value, and whenever any article is offered as such, considerably below that value, it is safe to conclude that it is inferior or worthless.

The commercial fertilizers now sold are compounded somewhat in accordance with the needs of the special crops to be raised, so that, unless one makes a business of it, we cannot suppose that it would be cheaper to buy the "chemicals" and mix them one's self.

Telling a Horse's Age by its Teeth.

John W. Glover, Gibson Co., Tennessee, asks how to tell a horse's age by his teeth.

ANS.—A horse has forty teeth, composed of twelve incisors or cutting teeth, placed in front of the dental arch; four tushes or canine teeth, one each side behind the incisors in the upper and lower jaws; and twenty-four molars or grinders, occupying the back of the mouth. The mare has the same number of teeth, except the tushes, which, in her case, are almost invariably absent, thus leaving her only thirty-six teeth. All teeth are composed essentially of enamel, dentine and cement or crusta petrosa, corresponding to bone. The teeth are constantly growing from their first development to the animal's death. As material is removed from their top by attrition, they are forced up from their sockets to supply its place. Tushes are never shed; they make their appearance when the animal is from four and a half to five years old. Hence, if they are just protruding, one can readily know, without any other evidence, the horse's age. Either at birth, or within four days thereafter, the colt has four milk teeth, called centrals. The lateral teeth appear between four and six weeks after birth; the corner teeth about the eighth month. The centrals, or those that first make their appearance, are shed when the owner is between two and a half and three years old; the laterals are shed between three and a half and four years old; the corner teeth between four and a half and five years. About this time, or a little before the tushes are full-grown, horsemen say the animal has a full mouth. On the incisors, in the upper and lower jaws, are black spots, called infundibula. These are worn out of the smooth surface of the central teeth in the lower jaw at six years of age, while those on the laterals commence to disappear at the same time, and have vanished when seven years old. Thus at this age the wearing surfaces of both central and lateral incisor teeth are smooth, the black marks having been worn away by attrition, and the marks of the corner teeth begin to disappear, and have entirely disappeared when the animal becomes eight years old. The horse is now considered "aged," and no conscientious veterinary surgeon or horseman would positively assert the animal's age, only approximately. Some people aver they can determine the exact age by signs other than the teeth, but such indications are unreliable.

As the animal advances in age his teeth gradually grow long, and appear to become more horizontal. The mouth, which at five years old was cup-shaped, now loses this appearance and becomes elongated. The teeth, which were in the age last mentioned nearly perpendicular, are now slanting; and this process increases with advancing age.

As a horse grows old, its teeth lose their beautiful whiteness; assume a cloudy or smoky yellow hue instead, and become streaked with brown and black marks, while not infrequently the tushes drop out.

A Good Potato Store-house.

A Subscriber—No address—has a root-house built of logs; one end extends into a bank and the rest is filled with dirt two feet thick. It will hold about 800 bushels. Last year the potatoes put into it rotted very badly and he inquires what sort of bins should be put into it, and how should it be ventilated so that another time the potatoes would keep well.

ANS.—There were probably two causes for the crop rotting so badly: first, the house was too warm, we should judge from the above description. Second, too many potatoes were placed together. Roots of all kinds require a cool, dry place for storage; just warm enough to be safe from frost. He should have an alley at least three feet wide running through the center the entire length of the cellar, with bins on each side to hold not more than fifty bushels each, narrow and deep, and raised a few inches from the ground by means of scantlings placed under them. The bins should stand with the ends to the alley, with a space between them sufficiently wide to admit of a free circulation of air. Too many roots deposited in a mass, are liable to sweat and be seriously injured by the heat and moisture. A shaft or flue, eight inches square, constructed of rough boards, and descending from an opening in the roof to within a foot or two of the floor near the center of the cellar, would be sufficient for ventilating purposes. The foul odors which arise from the decayed, or decaying vegetables, if retained in the cellar, will materially hasten the decomposition of the sound roots.

Salt and Water in Pastures.

W. L. Chambers, Linn Co., Kansas, asks how often should stock be watered and salted.

ANS.—If animals while pasturing can drink whenever they wish, they will do so often but never take much at a time; but if they can get drink only twice or thrice a day, they will frequently swallow enormous quantities, a thing which cannot be healthy. The same is true with regard to salt. If salt is always within their reach, animals will lick it once or twice a day or once every couple of days, just as their systems may need it; whereas, if they are given salt only occasionally, they should not be allowed all they are inclined to take. Both salt and water should be always within reach of cattle, and where this is impossible, they should be watered at least three or four times a day, especially in warm weather.

Cholera among Poultry.

A Subscriber, Mt. Morris, New York, writes that the poultry in his neighborhood are dropping off suddenly without any known cause, after a sickness of, at most, twenty hours. The first thing noticeable is that the droppings of the afflicted birds are yellow; the birds are dumpish and look as if they were lousy, though they are not. They mope around for maybe only an hour or two, and drop dead sometimes while laying in the nest. The young chicks are going too. A neighbor who had forty old chickens the other day, has now only three left, and these may die any moment. Some try alum water, kerosene, copperas; others, sulphur and pepper, but all are useless, and he inquires whether there is any remedy.

ANS.—The disease which afflicts the poultry is cholera. Green rue chopped up fine and given in thick oatmeal gruel, with about 20 drops of white carbolic acid to half a pint of gruel, is an excellent remedy. Pour two or three teaspoonfuls down their throats three times a day, while they cannot or do not care to eat. We have known this to work wonderful cures. While the fowls are weak, lay them in boxes of clean straw, dusting carbolate of lime over the boxes and through the feathers of the fowls.

Miscellaneous.

Henry Smith, Granville Co., N. C., has a Calla Lily that has been blooming three years. At first it did well in a two-quart can, then stopped growing, until put into a water bucket last winter; and he is, very naturally, anxious whether it will be necessary to go on enlarging the vessel in the same proportion. The bulb doesn't seem any larger than it was at first, and when turned out to dry in the summer it soon starts growing. He sends a leaf of what was sold to him as a Water Lily, but which he thinks a Calla Lily, and also a leaf of another plant whose name he has no idea of, and asks for information.

ANS.—The leaf is that of the Calla Lily, so called, though it belongs to the Arum family. A pot eight inches in diameter is large enough.

The other leaf is a Hibiscus Rosa-Sinensis.

Mary Wager Fisher, Bryn Mawr, Pa., asks: 1. Will Roses be as likely to do well procured from nurseries in the fall as in the spring? 2. If so, what fall month is best suited for their transplanting, special reference being had to climbing, hardy varieties.

ANS.—Roses (hardy) can, on the whole, be moved equally well in fall as in spring, if not better. Planted in the fall, they may, under unusual weather in winter, die; but the chance of their death is equally great, and indeed greater, when planted in spring. They are very excitable in spring, and sudden droughts are therefore apt to kill them. Plant them from Oct. 15th to Nov. 15th. The hardy, climbing varieties will endure more hardship than many other kinds reputed quite hardy.

J. L. Tomlinson, Albion, Ill., asks: Where can a person buy an Automatic Cow-Milker? How much do they cost, and are they good?

ANS.—There are two cow-milkers in the market; one sold by W. F. Ely, Madison, N. J., was spoken of in the RURAL, July 13, by Col. Wold, who had been asked by us to test its value. Another milker—and both of these spoken of are automatic in action—is sold by George E. King, 575 Broadway, New York city. This milker is now being tested for the benefit of the RURAL'S readers, and the report will be published as soon as received. We have heard informally that it does satisfactory work.

In consequence of a number of inquiries of this nature, received lately, we may be pardoned for asking, why do not readers consult our advertising columns on all such matters? The space devoted to the announcements of merchants and manufacturers is as important to our subscribers as any department of the paper, and they throw away one of the pronounced advantages of a high-class journal by not giving the business announcements their due importance and attention.

RURAL SPECIAL REPORTS.

DODGE CO., Neb., July 16, '78.

WE are having a heated term—thermometer, 101° in the shade, and 125° in the sun at 5 P. M., I do not believe we could keep cuttings alive in such a top heat. I am beating the world (of Nebraska) this year in corn. Planted on the 29th and 30th of April, it is now six feet high, showing tassels. It is common Yellow Dent or Horse-tooth as you call it in the East. Have been "through it" with shovel-plow three times and shall give it another touch,—all horse work, not a hoe or a hand put to it in any way. Planted by machine, cultivated by machine, and as regular in the field as machine work, it is a sight to see, and 30 acres of it. This is a small field out here, but a very big one it would be in the East. Nights are so hot that corn fairly jumps. The whole country is one big green, never had a better season for growth, and crops are sure to be very full. Why don't you folks send the tramps and communists out to fight the Bannocks? They complain that they can't get bannocks to eat at home. We have rather too many of them in Oregon, &c. Great country this West! We can feed the world and lick all creation as soon as they've done dinner.

Potatoes are "sum punkins" this year.

S. R. M.

BROWN CO., Wis., July 11.

OUR haying is just well under way and it is keeping up the old adage that "it never rains but it pours," and if we had a little less hay down we would be more complacent in our observations of things. Hay is a good crop and was being got in good shape before this storm played Cain with our calculations. The midge is at work in wheat fields and will probably help to reduce our threatened overplus of that grain. Corn is just beginning to grow, having had a sorry time of it thus far this year. Potato bugs are quite plentiful this year, but they don't terrify us any more. Rye harvest will begin next week and soon after we shall be in the oat fields. By the way, we are growing tall rye in this region this year. The ball was started by some one taking to one of our local papers a stalk six feet eight inches high, and farmers have been going one better until one has brought in one a little over nine feet. Who will beat this?

VAN.

UNICOI CO., Tenn., July 22.

WE have passed through a few months of very remarkable weather. The last half of the winter was unusually warm and dry, the spring but little if any warmer than the winter with not sufficient rains to push the wheat forward, leaving it behind to be overtaken by rust which has injured the crop severely—some fields are not worth harvesting. The weather continued cool till July, and now when the change has come, the heat is almost unbearable to the farmer. Oats are a medium crop, while corn and potatoes promise an abundant yield. A heavy rain storm passed over our town on Friday last, accompanied by heavy thunder. A lightning bolt struck the house of a neighbor instantly killing two children aged 7 and 9 years. Three other members of the family were severely shocked, but it is thought they will recover. Little or no damage was done to the house.

E. S. HULIN.

CLINTON CO., IOWA, July 20, 1878.

THE farmers are in the midst of their spring wheat harvest at present, but they find the crop injured to a considerable extent by too much rain in the early part of the season, followed by excessive heat and superabundant chinch bugs. Otherwise the agricultural out-look is very good; the hay crop is very large, and the pasture is extra good. Wheat, 85 cts.; corn, 30 cts.; oats, 22 cts. per bush.; butter 8 to 10 cts. per lb.; and eggs 8 cts. per doz.

DANIEL CONRAD.

WALKER CO., Ala., July 24.

WE are having very hot and dry weather; crops are suffering severely in some localities; the rain seems very partial. I have had sufficient rain at my place until the last two weeks, while only two miles east of here there has been none for a month; and only two days ago a considerable shower fell four miles south-west of here. The fruit crop is good, and so would be the prospects of the corn and cotton crops but for the drought.

BUEL ANDRUS.

ST. LAWRENCE CO., N. Y., July 15.

WEATHER very warm and dry; rain is needed very much; the hay crop not yet half secured; new meadow good; grain good; potato bugs very abundant; hired help plenty at 75 cents to $1.00 per day and board. Excursions, pic-nics, fishing parties and camp meetings seem to be the order of the day along the St. Lawrence and among the Islands.

A SUBSCRIBER.

JEFFERSON CO., N. Y., July 26th.

WHEAT and early crops were fine. Up to last week the hot weather and drought burned up everything. All things are so dry that fires along the railroad are frequent. Corn is all curled up, and the farmers' blue-grass pastures burnt up.

*

MEEKER CO., Minn.

CROPS of all kinds are promising a good yield. Barley and rye are being harvested and oats will be ripe in about two days. Grain is unusually tall this year and some of it is lodged. Rains very frequent.

M. E. B.

ESSEX CO., Va., July 18.

OUR wheat crop is very short this season and quality is poor.

R. SAUNDERS.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY AUG 3, 1878.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to the Editor, the Publisher, or* THE RURAL NEW-YORKER, *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

WE offered, some time ago, to sell the cuts used in this Journal for ten cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

POTATOES AS FOOD.

THERE are few articles of food which have been used to the same extent, and which have still been so persistently disparaged as potatoes. A few years ago some genius wrote an article, which was copied from Maine to Texas, in which he claimed that potatoes were nearly worthless as food, because their starch was locked up in insoluble cells, and could not be reached by the digestive juices. And, now, one of the leading agricultural journals of the West comes to us with an editorial in which it is claimed that the potato has always been overrated; that as an essential diet it would not be greatly missed; that it is rich only in starch; that this must be converted into sugar before it is valuable as nutriment; that it is by no means sure that even a reasonable quantity of it is ever so converted, and, finally, that, aside from its bulk, the amount of starch converted into sugar is the criterion of its value.

Now, we cannot agree with such views; we consider the potato, both theoretically and practically, an article of food of great value and we propose to offer some indisputable evidence in favor of this view. Taking the average of German analyses, which allows us to make a perfectly fair comparison, we find the composition of the dry substance of potatoes, wheat, corn and oats to be as follows:

Composition of dry substance in per cent.	Albumin-oids.	Fiber.	Carbo-hydrates.	Fat.
Potatoes	8.4	4.4	82.8	0.8
Wheat	15.2	3.5	77.2	1.7
Corn	11.7	6.4	72.4	7.6
Oats	14.0	10.6	64.3	7.0

We may see, therefore, that while potatoes contain a greater proportion of starch than grain, they still furnish a very important amount of the so-called flesh-formers and half as much fat as wheat; in the light of this table, therefore, some of the propositions laid down by our contemporary seem doubtful, to say the least. The Germans have, however, gone further than this and have tested the digestibility of these substances by a great many careful feeding experiments, and the results of these give potatoes a higher comparative value as food than the above table which simply shows the composition. This is shown by a second table as follows:

Digested in per cent. of dry substance.	Albumin-oids.	Carbo-hydrates.	Fat.
Potatoes	8.4	87.2	0.8
Wheat	12.4	73.6	1.4
Corn	9.3	71.0	5.6
Oats	10.5	50.5	5.5

Considered as an *article* of food and not as a *complete ration*, the dry substance of the potato compares favorably with that of our best feeding grain. In speaking of the digestibility of potatoes, WOLFF says that scarcely a particle of potato starch can be found in the excrements of ruminants which have been fed with them.

Now, whatever the transformations which it may undergo before it leaves the body, there is nothing to show that the digestible starch of potatoes does not produce the same effect as the digestible starch of any variety of grain. We believe, therefore, that there is no reason to give potatoes a less nutritive value than is shown by our table of digestibility; it is to be remembered, however, that this only considers the dry substance, and that, as potatoes are 75 per cent. water, and grain but 14.4 per cent., it requires three and one-half times the weight of potatoes for a given amount of dry substance that is required of grain.

The poor opinion of potatoes originates from not feeding them in a proper manner—there is nothing more certain than that, where they are fed in an improperly constituted ration, they may so decrease the digestibility of coarse fodder as to nearly neutralize their own constituents. But if the nutritive ratio is not greater than one to eight (i. e. if the albuminoids are to the carbo-hydrates, including the fat multiplied by 2.5, as 1:8) they may be fed with twice their weight of coarse fodder without occasioning any loss; and, if sufficient oil meal, flax or cotton seed, bran, shorts, malt sprouts, beans, etc., are added to keep the nutritive ratio about 1:6, they may equal the weight of the coarse fodder and still no loss result.

If these important points are remembered and a sufficient supply of salt allowed, which is more necessary when feeding potatoes than with most other kinds of food, there will be no occasion to doubt the food value of this tuber.

THE LATEST CROP REPORTS.

TOWARDS the end of the week gloomy reports of severe injury to all ungathered cereal crops have come from the Northwest. The hot suns of late had there, as elsewhere, produced an unusually large growth of stalk, and now excessive rain and wind storms have prostrated the wheat and corn fields and blighted many farmers' high hopes of a splendid harvest. Those railroads, too, whose prosperity depends mainly on transporting to the seaboard the vast harvests of that great grain-growing region, are sensitively affected by the prospect of diminished business, and already their stocks have dropped heavily in the money market.

Even before the occurrence of the calamity, however, the crop outlook in some parts of the affected section had become somewhat clouded. As early as the 17th inst. reliable estimates placed the damage done to the wheat crop by storms and excessive heat at seventeen per cent. in Wisconsin and twenty-seven per cent. in Iowa. In the southern part of Minnesota it was estimated that there would be a deficiency of twent-nine per cent. in the yield of wheat. And although this deficiency would probably be compensated by an average yield of from 12 to 25 bushels per acre on the larger area planted elsewhere, making the aggregate product the same as last year, yet the quality is held to be considerably below that of former seasons. Throughout the whole country tile-drained lands show superior crops; while crops on undrained lands are slow to recover from excessive rains.

In other parts of the country the latest reports of the Department of Agriculture, corrected by those we have received still more recently from other quarters, show that Illinois falls off in her acreage under corn seven per cent. or about 670,000 acres, and Wisconsin four per cent. or about 40,000 acres, while Texas has planted 200,000 acres more than last year. The yield throughout the country will hardly be above an average one, but in the South the prospects are remarkably promising. The crop of winter wheat gathered in the middle States is very large, and on the whole, the average is 101; while that of spring wheat was as high as 106 before the late disastrous news from the Northwest. Of rye, barley and oats there will be somewhat over an average yield. Reports from the fruit crop are fair, except from the peach region around Chesapeake Bay and the fruit belt of Michigan. Grapes too have been cut down nearly everywhere below the average by the May frosts.

"CORNERS" IN GRAIN.

CHICAGO and Milwaukee commission merchants, stimulated by the late unfavorable crop reports, are just now in the midst of a great "corner" in wheat. For the last two weeks the price has been steadily advancing, and now the interest has become intense in the results. There is a fair prospect that the present or even higher rates will rule for the next week or two, and shrewd farmers may thereby be the gainers. The visible supply of wheat is said to be only about four million bushels, yet it is stated that "short" sales for August delivery, already aggregate nearly twenty million bushels, and still such sales continue to be made. As those who have made sales of this kind have not, as a rule, as yet bought a bushel of the grain they have already sold, should its price increase before the date at which they are to deliver it, they will lose the difference between the figures at which they have sold it and those at which they would have to buy it to fill their contract. Should the price meanwhile fall, they will gain in like proportion. The point in which the farmer is here mainly interested is, that while the speculators when they gain are always willing to fill their contracts, when they lose they often declare themselves bankrupt; the purchases they have actually made are repudiated; an unusually large amount of grain is thus suddenly thrown on the market, and prices at once sink. Hence it is, that after the close of a "corner" in any product, that product generally falls in price, at least for a short time. As a rule, however much the farmer may lose, he gains comparatively little by "corners" in his products; for, apart from the action of middlemen, however high the price of his goods may in this way be temporarily run, it is seldom that the article sold is actually delivered; but instead thereof, the difference in money between the figures at which it was sold and its market price on the day on which it is to be delivered, is usually handed over to the purchaser, or to the seller, according as one or the other has gained by the transaction.

SCIENCE.

AMERICANS think that a love of science is one of the leading characteristics of our people, and attention is directed to a large attendance on lectures of this character as a very pointed demonstration of the fact.

The truth is that we are not scientific in our instincts in the best sense. Men whose bent is to pursue abstract inquiries, the successful result of which is to extend our knowledge and elevate civilization to a still higher plane, are not in the least encouraged, while wealth is freely expended in endowments of a less important kind.

The only science that is appreciated is of the kind that "has money in it;" whose application directly increases wealth in commercial channels. This fact is disgraceful to our culture, and so patent is it that in Europe the debasing result has coined a term—Americanization—that has the force of a stigma among scientific men.

Prof. Tyndall gave the proceeds of his lectures in this country as an endowment for the encouragement of pure science. The fund is in itself insufficient to accomplish the purpose, but not a dollar has been added to it by an American! We have numbers of wealthy farmers, but who among them has shown a willingness to devote his time and fortune to the science of agriculture as has Mr. J. B. Lawes, of England, solely that the science of agriculture might be advanced, and the results published for the advantage of the world?

We are a nation of money-getters, and that is about the best and the worst that can be said of us. And a humiliating confession it is!

NOTES.

Prickly Comfrey.—The RURAL was one of the first agricultural journals to talk about Prickly Comfrey as a forage plant two or three years ago. At that time we recommended its trial upon the authority of our English exchanges, which extolled it as one of the most promising summer forage plants grown, both as regards quality and quantity. The quantity which may be raised upon a given space was not much exaggerated, and Dr. VOELCKER's analysis of the quality is no doubt as trustworthy to-day as when it was made and published. But in spite of Dr. VOELCKER and the unusual amount of flesh-forming and heat and fat-producing substances, which he showed it to contain, our horses and cows are not educated up to the point of any appreciation of its value. We have also offered it to the horses and cows of our neighbors and we find them no less indifferent to their own welfare. Our experimental Prickly Comfrey is thriving splendidly. Some of it was cut early in the season and a second growth of leaves might now be cut again. But what shall we do with it?

A Singular Aquilegia.—Of the many self-sown Aquilegias (Columbines) which sprang up from self-sown seeds, one bloomed this season which bore a flower different from any other we have ever seen. We are tolerably familiar with the several species in cultivation, but this so differs from them that we can not even guess at its parentage. The flowers were as large as those of A. Canadensis—a little larger than those of A. cœrulea. Some were solid blue—some solid white; some were half blue and half white; but the majority were variously striped with those colors. It bore seeds abundantly and this is one of the plants seeds of which (as far as they go) we shall offer to our friends in the fall.

Watering Plants During Sunshine.—Our esteemed contemporary, The Gardener's Monthly, thinks that no harm results from watering plants during bright sunshine, and we have seen the remarks copied by several papers. Is it not true that the globules of water resting here and there upon the leaves, have power to converge the sun's rays, burning the leaf or stem on which they rest, and causing discoloration. We have the impression that these dead spots do occur on plants more frequently during hot summer weather when showers are frequent and brief.

BREVITIES.

THE Hessian Fly—and no man pursueth.

DR. SAMUEL SEXTON says that out of some eight hundred ear-difficulties during last summer, sixty-five were found to have had their origin in salt-water bathing.

MR. ROWE kindly sends us four quarts of his seedling gooseberries Ruby and Emerald. We find that it takes eighty-three of the first and eighty-six of the second to make a quart.

Mr. CHARLES DOWNING writes us that "the Japan Pear with its large, roundish heart-shape, glossy leaves, and showy fruit, makes a very handsome lawn tree and could be used by the landscape gardener with effect.

MISS EMMA A. SMITH, the entomologist, says: "If the birds should entirely leave us, it is a question if any fruits could ripen in all the land. It is impious to talk against the birds, and sacrilege to wantonly destroy their innocent lives."

IT is said that tomatoes fed to cows improve both the quantity and quality of the milk, imparting to the butter a golden color. Does any body know if in this last respect there is any difference whether the red or golden varieties be fed to them?

WE have measured our largest specimen of Salix laurifolia (lucida var.?) planted four years ago. It is eighteen feet high and fifty-seven feet in circumference. In some soils it seems very slow to begin a strong growth. One planted at the RURAL farm, three years ago, is but four feet high.

IN South Africa, Natal, we believe, grass is kept in a fresh, moist state for any time by simply digging a hole in the ground, packing the freshly-cut grass closely into it, and then covering all with a layer of earth well trampled. Thus treated, its character seems to remain unchanged, and cattle eat it with great relish, and thrive on it.

TEN years ago at the Rural farm we tried the effect of a little care upon cherry trees. The care was given to two in a double row of thirty planted along a lane. The earth about the roots was loosened, muck and hen-yard manure applied, and they were well watered through one summer. No further care has since been given them. Those two trees are at this time at least one-third larger than any of the others, both in the main stems and tops.

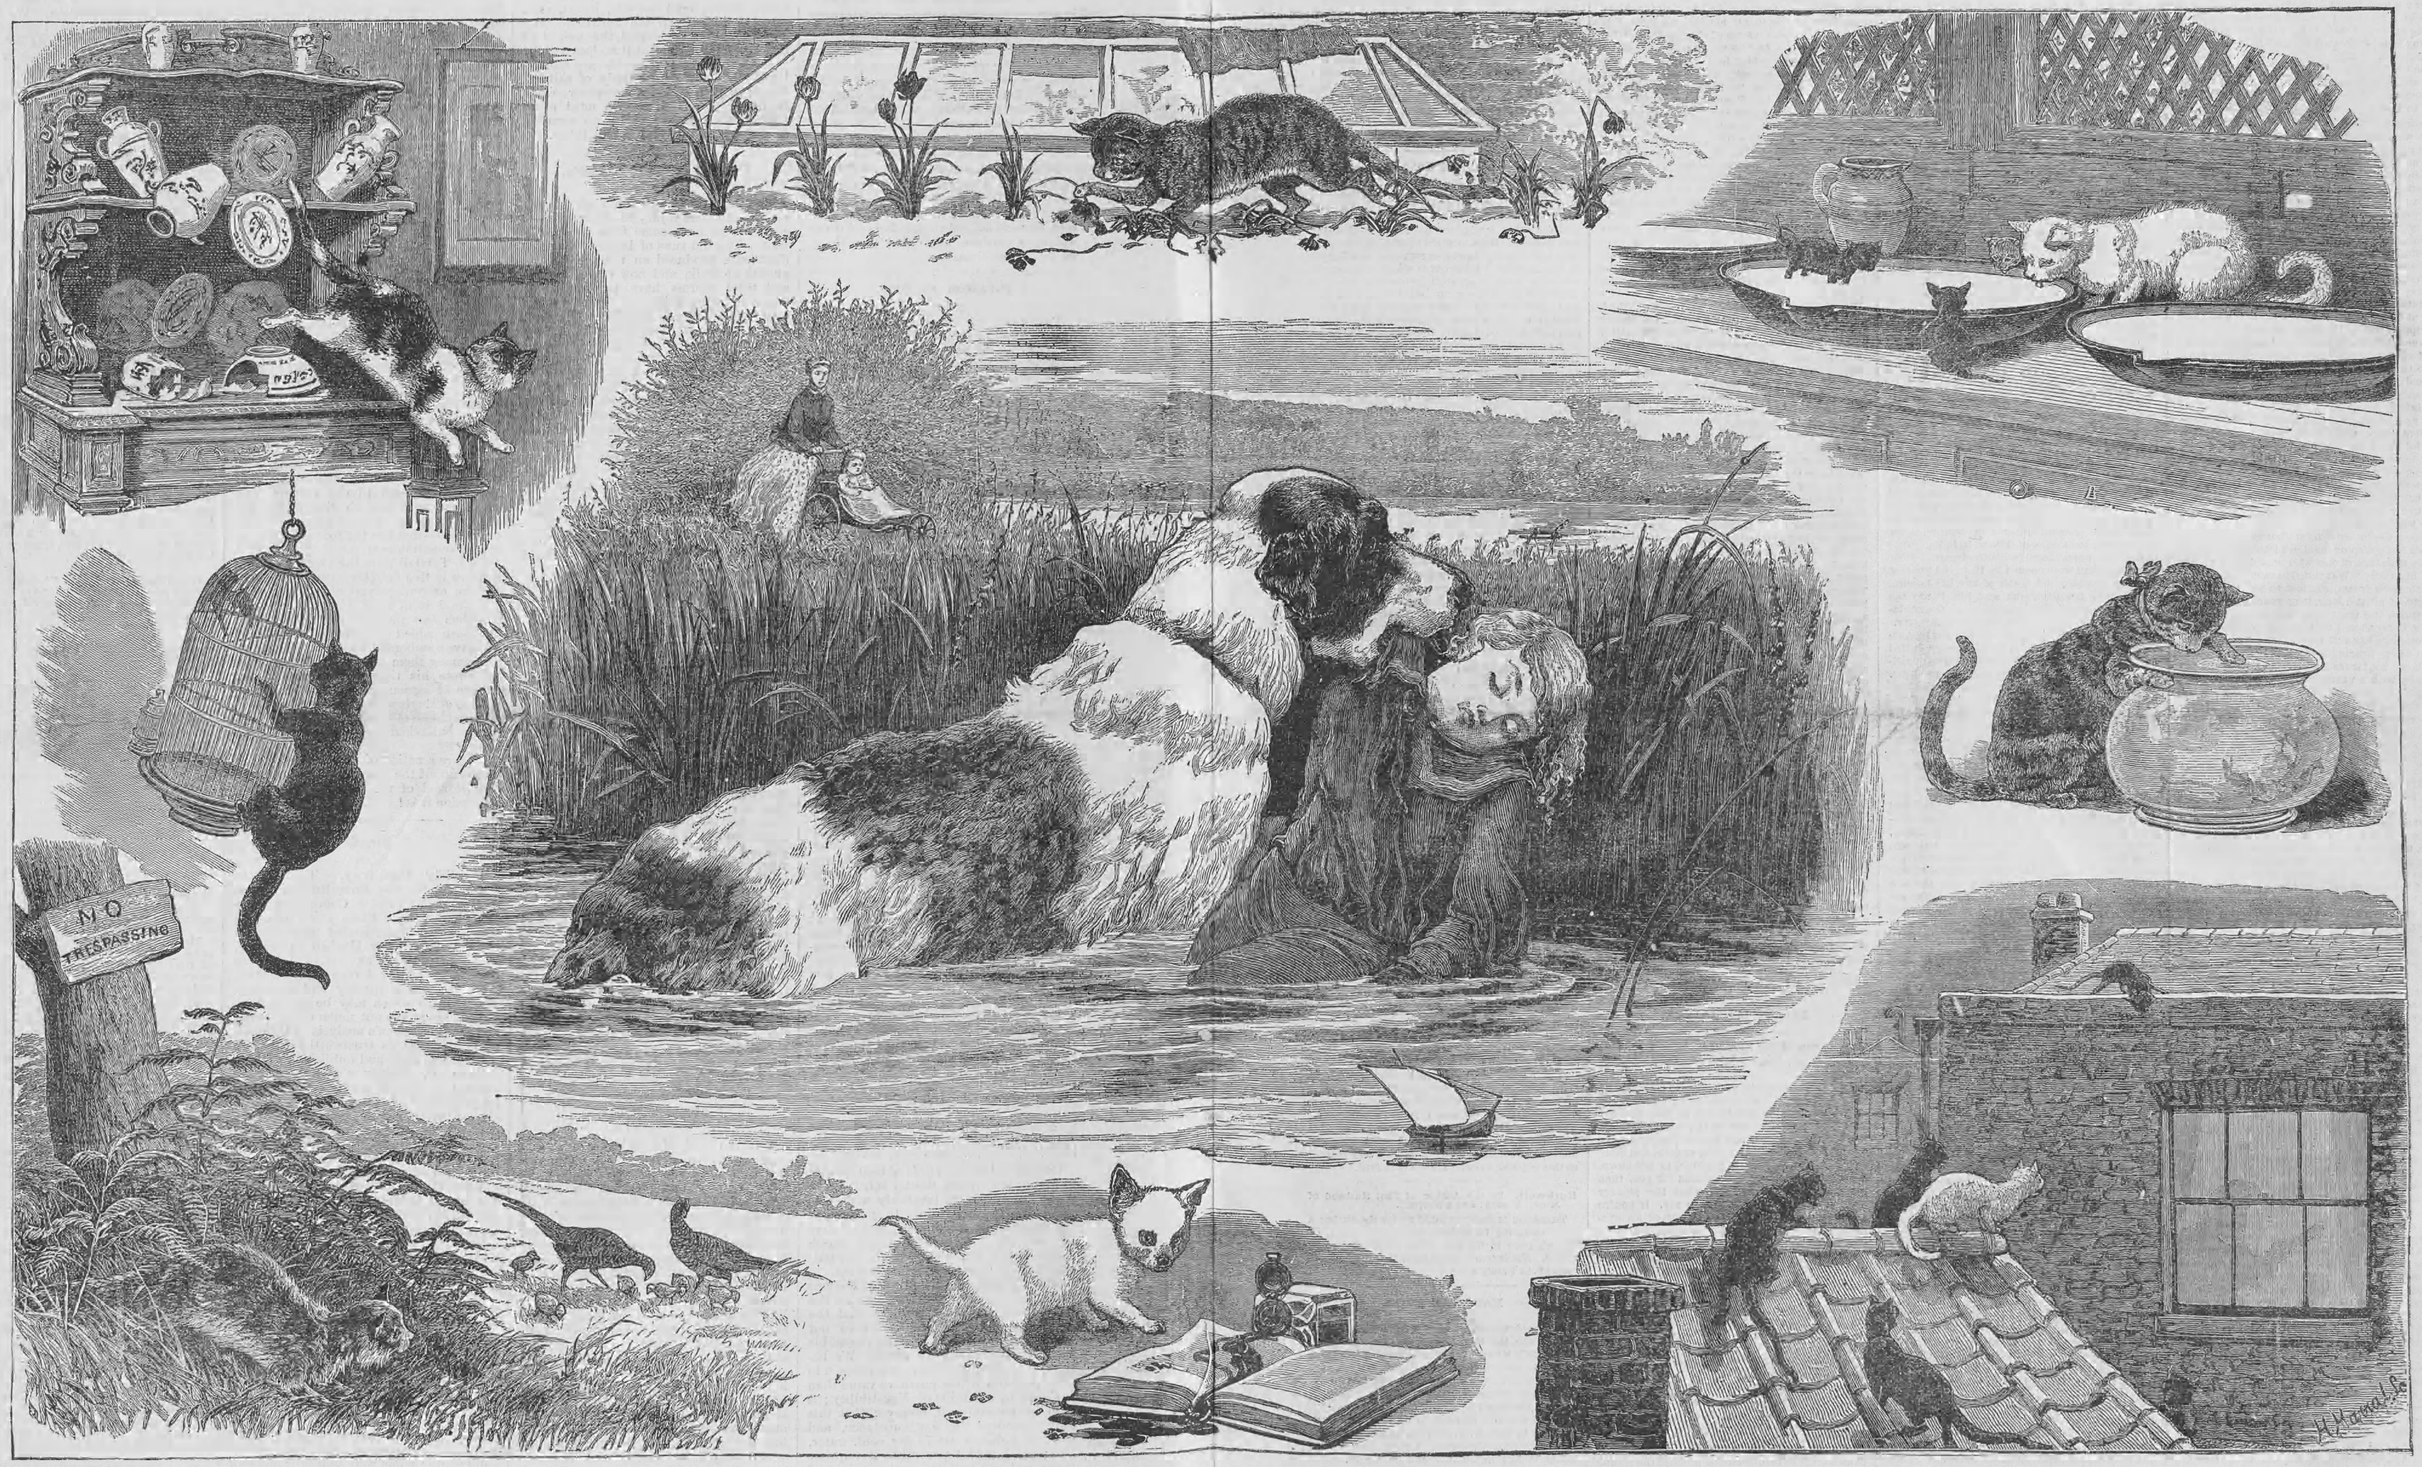
HAVE the objectors to vivisection ever paused to consider that every year millions are mutilated, nay, tortured, to give man pleasure, to make food palatable, while merely scores are mutilated (not often tortured) to discover remedial agents and scientific truths? What could be more inhuman than the torture inflicted on living geese, to obtain an epicurian delicacy, yet who has organized himself into a committee of one to decry the barbarism?

Mr. THOMAS, of the Country Gentleman, states in his American Fruit Culturist, that the roots of fruit trees may be considered to extend in every direction from the base of the trunk to a distance equal to the hight. According to this rule, the roots of a tree occupy a circle the diameter of which is double the hight of the tree. From recent observations he increases this distance so as to make the diameter of the root-circle *three times* the hight of the tree, "believing this to be a fair average for nearly all cases."

THE nurserymen's convention recommended hot tobacco water or a hot solution of whale-oil soap for the aphis of the cherry tree. The ends of the infected branches are to be dipped into the vessel containing the solution. We respectfully submit that there is an objection to this remedy. It is that the time and trouble of applying it would cost considerably more than the crop of cherries would be worth, as we think the members of the association recommending it would admit if they were seriously to consider this method in detail.

Mr. A. B. GRANDELL speaks of having seen a Lilium superbum (our Turk's-cap) seven feet high, that promised an enormous crop of flowers. We have never seen one attain such a hight, and give therefore the manner in which the bed was prepared. The soil had been excavated about 18 inches in depth, and 6 inches of small stones placed in the bottom for drainage; the bed was then filled with thoroughly decayed sods, and a very little old well-rotted manure. Some sharp sand was incorporated with the soil: when planted the bulb was completely surrounded by the same. During winter the bed received a light covering of manure, which was the only fertilizer that had been applied since it was formed.

THE Farm Journal says, that the RURAL NEW-YORKER has an experimental farm, and now the American Agriculturist is establishing one, and then humorously adds: "Just wait awhile till we get ours, and then you will see the dirt fly. We intend to dig a culvert through the middle of the farm for drainage; we shall plow eighteen inches deep and subsoil below that; we will make our own fertilizers by an ingenious mixture of soils; and carry on all operations by steam-power, from rocking the baby to grinding beets for sugar. And we shall let our readers into all our secrets. Subscribe now, before we buy the farm!"



A QUESTION OF EQUITY AND OF COUNTY REVENUE: WHY NOT TAX CATS AS WELL AS DOGS?

Literary Miscellany.

MAMIE GREY'S SACRIFICE.

BY M. B. C.

ONLY a torn, soiled letter lying on the sand at her feet, a few faded water-stained lines, and yet as the sea breeze wafted it hither and thither, a gloomy sadness seemed to cloud that fair young face.

The whole landscape which, but a moment before was lit with the resplendent glory of the departing rays of the sun, now appeared cold and grey to that lone watcher on the beach.

A sorrow seemed pending over her, and for a little while in sad thoughtfulness, she watched the fluttering paper as if she could find some solution of the strange mood that possessed her. Suddenly the breezes grew stronger, and the neglected scrap would have been whirled away to find a resting place beneath the ocean's waves, had not MAMIE GREY moved to rescue it from its insecure resting place. Stretching out her hands, she raised the forsaken waif from the sand, and shielding it from the pitiless wind, she glanced carelessly at it. A gleam of interest awoke at the first glance; the penmanship was not familiar, but the words,—how strange! From the broken, disjointed sentences, she gleaned news of a magnificent bridal in the distant city of W——. The description was so vivid and glowing that in her eagerness to learn the names of the happy couple, she forgot the sad unrest that had brought a cloud to her brow but a moment before; but it was only for a brief space, and then she realized why she had been so sad and lonesome all the long bright afternoon.

Only one clause, one name, and yet it had power to drive every particle of color from the fair rounded cheek,—to send a wild, frightened look into the sweet brown eyes, and to cause the ruby lips to grow pale and quiver with anguish. The whispering sea breezes little knew the sorrow they brought to MAMIE'S loving heart, when they bore to her feet this cruel bit of gossip; for it was news that would drain her life of all sweetness, and make the future a dreary burden.

From the gossiping maiden's letter, she learned of the marriage of one who was dearer to her than life itself. WALTER GRAYSON, the idol of her summer's dream, was lost to her, and as she thought of all the long, long years to come during which she must bear her sorrow alone, it cannot be wondered that she almost prayed for freedom from her suffering. One year before she was a merry-hearted maiden, living in her cottage home not far from where she now bemoaned her fate, with no thought of care, but to-night, how sad the change! The glorious sunset, the glittering foam of the surf, all the beauties in nature were lost to her in contemplation of this one great sorrow of her life. She could not weep, so deep was her emotion; and, as she sat there in mute anguish, gazing forth on the water, the evidence of the tumult raging within could be plainly traced on pallid brow and cheek.

Oh, how short had been her dreams of happiness! It was only in the early summer time, WALTER GRAYSON first came to the little country village for rest and a few months' fishing. His fickle, unstable nature was soon attracted by the lovely grace and modesty which MAMIE possessed; but no thought of more than merely relieving a few of the tedious summer days ever entered his head. Was not his betrothed, IDA PAYNE, at some summer resort whiling away her time by flirting, and why should not he enjoy himself as well? If in the end IDA'S thousands came to replenish his pocket, it mattered not though a dozen country girls' hearts were broken, if he only could enjoy himself. So, by all the arts in his power, he taught the tender, trusting heart to love the tall, handsome stranger who wished only to use her love as a pastime, and, then, when tired of it, to cast it aside, as a worthless bauble.

He succeeded well in his intentions, and when the leaves were tinged with autumn's mellow tints, he went away leaving MAMIE miserable at his cruel faithlessness.

In the early twilight she sat alone on the barren shore, heedless of the cold, dark gloom that was gathering about her.

A boat rounded a distant point, but she heeded it not, until a wild cry for help aroused her from the reverie into which she had fallen, and caused her to think of sorrow other than her own. The occupants of the approaching boat were a man and woman, undoubtedly some of the city guests at the Hall, who had been to the town below and were returning with the sail-boat; but what madness to think of sailing, when the sea is so rough! The slender craft was rocked to and fro by the cruel winds, and again that cry for aid rang out on the still evening air. The boat drifted nearer and nearer, why do they appear so helpless? can it be he has lost his oars? It is so; the oar is floating away on the tide.

Divesting herself of her outer wrap, MAMIE hastened to the place where she thought the boat might drift to land. She reached the spot just as the dainty craft was overturned, but living as she had from a child by the sea, she was an expert swimmer, and plunging into the rolling waves she struck out boldly for the place where she had last seen the dark-blue boating dress of the woman. From the first the man had nobly struggled to rescue his companion, but the rude waves had torn them apart, and weak from his exertion he was simply drifting with the tide nearer the shore.

Grasping firmly the dress of the woman, as she rose for the second time, MAMIE bravely sought to reach the sand; but it was hard, breasting the waves cumbered as she was, and when she recognized in the handsome face of the man her false lover, it was the last bitter drop in the cup she was forced to drain. Giving the form of her rival a push forward, she lost control of her limbs and sank beneath the seething foam. The cruel waves bore the insensible form of the wife to the feet of her husband; but WALTER GRAYSON saw only the white face of the one he had so cruelly deserted, upturned in the dusky twilight, and then the returning wave swept it back in its clutches.

When the morning sunlight came, the lonely watchers collected on the beach, found the dead body of MAMIE GREY. But the life thus sacrificed was not forgotten by one at least, during all the years of his future life. All the dross was burned from GRAYSON'S life by this fearful lesson, and when he appears in society it is hard to recognize him in the silver-haired man whom all delight to trust and honor; and, I think, in her home on high, MAMIE smiles her forgiveness down upon him, and in the glorious Hereafter all will be made right.

DIAMONDS.

F. M. ENDLICH.

As far as our reliable records reach back into the dim and mystic ages, we find the diamond occupying a prominent position in the estimation of man. Above all others of its qualities, which at present determine its value, the superior hardness to all substances then known, seems to have impressed the ancients. There appears to be but little doubt, that at very early ages the East Indians and the original inhabitants of the Chinese Empire knew the value of diamonds over all other gems. It is supposable, too, that the art of cutting was known to them, although it was not employed in the western countries until many centuries later.

Of all the countries which have furnished diamonds, India has been known as a prolific source for the longest period of time. Perhaps the most famous of diamond fields there are the Golconda Mines. Thousands of people have found and many do still find employment there, although much of the wealth has already been exhausted. During the reign of Louis XIV, Tavernier visited the Orient to collect diamonds and precious stones for his king. At that time (about 1680) he found 60,000 persons engaged in searching for diamonds in the mines of Ellore, in India. Next to India in importance is South America. The mines in Brazil were opened in 1727, and the best of them are situated north of the Rio Janeiro. On the Rio Jequitinhouha and Rio Pardo the most remunerative fields are found. Other placers have yielded very good diamonds, however.

On Borneo, in the Ural Mountains, and in Australia, diamonds have been found. In the United States they have been collected at several localities, but only in comparatively isolated specimens. Diamonds have been obtained from North Carolina, Georgia, Virginia and California. The notorious occurrence of these precious stones in what was termed the "Arizona diamond fields," situated in the North-western Colorado, is probably still too fresh in the memory of everybody to require special mention. Diamonds were certainly found there, but, to use a popular phrase, "they had not grown there."

Recently discoveries of extensive diamond fields have been made in Africa. They are situated on and near the Orange and Vaal Rivers, and are being worked with energy. Although their discovery dates back but a comparatively short time, it appears that the existence of diamonds there was already known during the last century. According to Dr. J. W. Morton, the natives have for a long time used diamonds from this locality to drill their stones, and formerly made periodical visits to replenish their supply of material.

As is frequently the case, the present impetus in that region to mining operations was given by the accidental discovery of a diamond. It was found in the hands of some children who were playing with the pretty pebble.

Wherever diamonds are found, they occur in redeposited material. River-drift or boulder-clay may contain them. No matrix for them has been recognized with certainty as yet, although it is claimed that the Itacolumite (flexible sandstone) of Brazil contains them. This assertion is scarcely proved, however, and even if it were so, this very Itacolumite is but the product of re-deposition. It may be regarded as a significant fact, perhaps, that the localities of North Carolina and Georgia, where diamonds have been found, are not far removed from occurrences of flexible sandstone. In the South African diamond fields the gems are contained in a conglomeritic mass. It is composed mainly of volcanic material, but has evidently been deposited by water. In its general, physical character it may be compared to the "blue cement" of California, which is auriferous.

Of all these localities mentioned, India has produced by far the greatest number of celebrated diamonds. The largest diamond of which we have any knowledge, is mentioned by Tavenier. It was found in 1550, was in the possession of the Great Mogul at the time of Tavenier's visit, and weighed 900 carats. The present "Great Mogul" weighs 279 carats, and may be a portion of the original one.

Among all materials the diamond is by far the hardest.

Physically, we may distinguish three varieties of diamond; the crystal, the carbon and the anthracite diamond. The specific gravity of diamond is 3.52, while that of carbon is 3.01 to 3.60, and that of anthracite diamond only 1.66. They show slight impurities, as compared with the crystals, but are chemically diamonds as also in their hardness. The carbon is put to practical uses, on account of its comparatively low price and great hardness. Instead of being colorless it is black, or gray, translucent only in very thin slabs.

Chemically, the diamond is carbon. At a high temperature it will burn, and be completely consumed, giving off carbonic acid gas. In an atmosphere of pure oxygen it will burn on, if once ignited. Between carbon points of a heavy battery, the diamond will become spongy, and turn to coals. In 1694 the first experiments of burning it were made. This was accomplished by means of a very powerful lens, concentrating the sun's rays. Much speculation became rife as to the behavior of diamonds under the action of great heat. Emperor Francis I, of Austria, conceived the brilliant idea of converting or melting a number of small diamonds together into a large one. In 1750 he placed a quantity of them, and some rubies, in a crucible, and subjected them to intense heat for twenty-four hours. After cooling, the rubies were found to be intact, but of the diamonds not a trace remained. Shortly before the French Revolution a Parisian jeweller asserted the possibility of exposing diamonds to a very high degree of heat without injuring them. He made his experiments before the famous chemist, Lavoisier. Maillard, the jeweller, had carefully surrounded his diamonds in the crucible with pulverized charcoal, and they withstood the fire perfectly. So long as the oxygen of the atmosphere can be excluded, the diamond cannot burn, and the only harm that might befall it would be a cracking from the heat. This, however, occurs comparatively rarely. Lavoisier, fully convinced by the demonstration, first offered a correct explanation of the phenomenon.

Impurities in diamonds are partly of a physical, partly of a chemical nature. Among the former must be classed cracks and cavities. The latter generally manifest themselves in discoloration, unequally distributed.

Regarding the formation of diamonds much has been said and written, and many well conceived experiments have been made. More than any other agent, heat has been employed to reproduce these treasures of nature's laboratory. Thus far all experiments have failed to attain any available result. Some of the most eminent chemists of the present century have expressed the opinion that diamonds owe their genesis not to the action of heat, but to an organic process. Newton, when studying the optical qualities of the diamond came to the conclusion that it must be a "coagulated oil." By means of electricity very minute crystals of carbon have been obtained, but all efforts to reach greater size have been baffled. Liebig regarded the formation of diamond as the result of organic decomposition. Though this view may not be perfectly tenable, it commends itself to the poetical mind from its allusion to the rejuvenated phœnix rising from his own ashes. With an ever-increasing knowledge of chemistry and the constant improvement of mechanical appliances, we may yet, some day, be able to produce diamonds that will compare favorably with those fashioned by the skillful hand of nature.

PRACTICAL USES OF DIAMOND.—Dependent upon its physical properties, the diamond is put to various uses. Perhaps the most prominent is that of drilling. The comparative cheapness of "carbon" makes it possible to utilize this material for such purposes. Diamonds with sharp, crystallized edges, are used for cutting glass and small fragments, and splinters are used to arm graver's tools. Dust is employed in cutting other stones as well as the diamond itself. Wherever a substance of very great hardness is required, diamond answers best. On account of its high power of refraction, diamond-lenses were formerly prepared, for the use of very high-power instruments. The application of diamonds for purposes of personal or artistic ornamentation, may perhaps be considered a practical one in a certain sense. For such use the total absence of color and the high degrees of refraction and dispersion of light, place the diamond in the most prominent position among all precious stones.—*Am. Naturalist*

RECENT LITERATURE.

How to Spend the Summer. Where To Go; How To Go. How To Save Money. "Christian Union" Print, 29 Park Place. Price 25c.

Do you contemplate a visit to the sea-shore? Take our advice and before you go read what Frank H. Converse has to say in The Sea-Girt Isle, of a charming spot on the coast of Maine, where for a moderate cost you may enjoy all the delights of Cape May and Long Branch, and more too, and where "dress parade" is unknown. Perhaps camping-out has charms for you, then you ought not fail to read what the pioneer camper, W. H. H. Murray, has to say. If you've a fancy for trout-fishing, Laicus tells of its mysteries and fascinations, and—but space fails us to enumerate all the topics discoursed on in this modest little book, so we'll say that whether your preference is for making a European tour, "doing" camp-meeting, spending your vacation on wheels or at a farm house, taking short trips around New York, or making yourself an amateur tramp, this book will be to you the best of counsellors. Even those of us who belong to that much-to-be-commiserated class who must remain in the dusty town are not forgotten—a chapter is devoted to telling us How To Stay at Home Without Grumbling.

The Fall of Damascus. A Historical Novel. By CHARLES WELLS RUSSELL. Boston: Lee & Shepard. $1.50.

It is seldom that we read a story wherein the causes seem so inadequate to produce the results described and the results themselves are so unsatisfactory. The "Fall of Damascus" is a narrative of a number of inconsequent events with what is supposed to be a sketch, for a background, of the history of Damascus before and after its seizure by the Mahommedans early in the Christian era. The characters are without special attributes and are decidedly insipid, with the exception of one, the Lady Anna, who is wicked, fitfully ambitious, daring, unscrupulous, and hopelessly in love with the hero, Jonas, whose affections have been enlisted by an exceedingly commonplace heroine. Mysterious incidents partaking of the nature of the supernatural are introduced without any connection whatever with the plot, but with intensely dramatic effect. Thus, a chapter full of exciting details is closed with an interjectional communion at midnight between Lady Anna and an apparition who mysteriously appears, professes a desperate passion for her, and as mysteriously disappears. But the nature of the apparition, the cause of the visitation or the connection of either with the story is not made apparent, and one reads on to the end with a vain hope of having the enigma solved. Scenes of Eastern magnificence and laciviousness are fervidly depicted. One must have a keen appreciation of the melodramatic in literature to enjoy the "Fall of Damascus."

Poke O' Moonshine, by Latham Cornell Strong. New York: G. P. Putnam's Sons. $1.00.

The author claims there is much of legendary lore still abounding in this comparatively new country, which the genius of Fenimore Cooper and the other romancers has failed to discover and develop. He is inspired to add his tribute to the small store of American romance, by a legend of the La Mollie Valley, out of which he essays to weave a poem that shall perpetuate it. The story is of the loves of an exiled French maiden and a young French soldier engaged under Gen. Dieskau in 1757, in what are known as the French and Indian wars. Poke O' Moonshine is the name of a crevasse in amountain, through which the rising moon casts its light. The theme is a sombre one and calculated to inspire the poet's pen, but it owes nothing of embellishment to poetic imagery or lofty conception. One might cavil at the outset at the title, which, to say the least, is not poetical, and the meaning is often obscured by the too apparent effort to effect the versification.

Voyages and Adventures of Vasco Da Gama by Geo. M. Towle. Boston: Lee & Shepard.

The Voyages and Adventures of Da Gama is the first of a series of books, called Heroes of History, to be published for the benefit of the young people. Pizarro, we are told, is already in press and others are soon to follow. There is no class of literature that can be read by the young folks with so much profit combined with entertainment, and we cordially commend this volume as an earnest of the fund of amusement and information the series will yield. The adventures of the great discoverer are told in a manner to fascinate the juvenile mind.

Shooting Stars as Observed From the "Sixth Column" of the Times. By W. L. Alden. New York: G. P. Putnam's Sons.

This is a collection of those articles which the regular readers of the N. Y. Times are wont to eagerly look for on the editorial page of that Journal.

Mr. Aldon permits his humor sometimes to run to coarseness and not unfrequently it hints of absolute vulgarity, but in making this compilation the more objectionable articles have been omitted; and those who enjoy a hearty laugh will do well to lay in a stock of "Shooting-Stars."

Gabrielle. By HENRY GREVILLE. Philadelphia: T. B. Peterson & Bro

This lady works out a small part of the social problem with a very free hand, but her estimate of the correct morality of married life does not agree with that set forth by the Puritans as obtaining in the best society. We are getting educated up to the French standard of morality by a series of graduated examples, and we have no doubt that if the publishers persist, we will be able to take our immorality without blushing, in the course of time. We do not, at the present stage of our progression, consider this a good book for general circulation.

Orville College, by Mrs. Henry Wood. T. B. Peterson & Bros. Phila.: 50c. Paper.

Mrs. Wood's admirers will be glad to welcome the advent of Orville College. Though a most prolific writer, Mrs. Wood is strikingly original and there is an endless variety in her stories which will always commend them. The Lost Will is uniform in binding and price with the above, and both stories conform in every respect to this popular writer's known standard.

Rothwell. By the Author of That Husband of Mine. Boston: Lee & Shepard.

This book is likely to build up for the author a more enduring fame than her earlier effort, although each in its way gives proof of decided talent. She is to be congratulated on her success in fields so widely diverse.

MAGAZINE NOTES.

In accordance with a plan of the editor, formed a year ago, the Midsummer Holiday number of SCRIBNER'S MONTHLY opens with a portrait of William Cullen Bryant, engraved by Cole from a crayon drawing by Wyatt Eaton, for which the poet gave repeated sittings during the past spring. The paper on Mr. Bryant's life and homes, which it was also planned to have with the portrait, is by Rev. H. N. Powers, and was written before the former's illness. The illustrations are about twenty in number and chiefly represent points of interest at or near the Cummington and Roslyn residences. Dr. Holland also writes editorially of Mr. Bryant, and The Old Cabinet contains an estimate of his standing as a poet, and a reprint of the curious original version of Thanatopsis. The whole number is beautifully illustrated, and the stories are pleasant.

The ATLANTIC opens with a very pretty story by Miss Olney, One Too Many; Moonshine,

by Aldrich; The Europeans, by James; and The Stage in Germany, by Sylvester Baxter, together with New England Women, John Bull and The Moolid of The Prophet, make an interesting number. The Contributors' Club is very sprightly for dog-day weather. Book reviews have taken the form of essays recently, and add considerably to the interest of the numbers in which they appear.

THE second paper of Impressions of America, by Rev. R. W. Dale, in the August ECLECTIC, is devoted to politics; and a very just appreciation the writer has of our ways and our manners. Johnson's Lives of The Poets by Arnold, The Great Tropical Fallacy by J. A. Wilson, and Midhat Pasha's ideas on Turkey are very interesting papers. It is not every month that the clever editor of the Eclectic can muster between the green covers such an array of interesting matter.

LIPPINCOTT'S has invited Mr. King to cover its first eighteen pages with an account of his impressions Along The Danube, but the most interesting and novel paper is that by Marie Howland on Musical Notation. Every one interested in music should read it, and help give the old method a parting kick.

MR. E. H. KNIGHT of Centennial renown says something on that worn-out subject, the Paris Exposition. Our learned Consul at Cardiff has broken away from the tread-mill of official duty to tell his American readers about A Welsh Watering Place. Lucy Hooper says The Empress Eugenie is not growing old gracefully, and more besides that will interest the gossips. A Saxon God, and the serial, Through Winding Ways, are excellent fiction. The gem of the number is Henry James, Jr's, The British Soldier.

APPLETON'S JOURNAL begins by relating the woes of Flora, the ideal representative of the New York girls who work on artificial flowers. Mr. Rieding has treated the theme gracefully. C. F. Woolson goes Up in The Blue Ridge, and weaves a story about the bad men who make whiskey all the night and drink it all the day,—the illicit distillers. Genius and Labor by J. Henri Brown, Views of Westminster Abbey, Part 1, Beautiful Actresses, and Out of London are articles that would sustain the interest of the most exacting reader.

THE August POPULAR SCIENCE MONTHLY has a varied and attractive table of contents. The number opens with a continuation of Prof. Du Bois-Raymond's address on Civilization and Science, the special subjects of discussion in this installment being The Technico-Inductive Period, and The Dangers which threaten Modern Civilization. The next article is a brief but forcible address, delivered at the Harvey Tricentenary by Prof. Huxley, who, on the strength of his own investigations, gives the most emphatic indorsement to Harvey's title as one of the world's greatest discoverers. The third article in this number is the first of two illustrated papers on the teredo, or ship-worm—the creature which makes such havoc of our marine timber. The author, Dr. E. H. von Baumhauer, brings to his subject the results of a long course of observation and experiment, carried on and completed under the auspices of the Government of Holland. Following this is an article on The Dread and Dislike of Science. Under the title Man and his Structural Affinities, Prof. A. R. Grote discusses our relationship with the apes, illustrating the subject with a variety of new and accurate representations of apo anatomy and physiognomy. Voluntary Motion, by Prof. Payton Spence, M. D., is a paper of great interest, especially to teachers, as it brings out in a very striking way the enormous importance of our inherited aptitudes in the process of education.

Prof. Youmans opens the editorial department with a strong article on Religion and Science at Vanderbilt University, in which he sharply criticises the inconsistency and bigotry of that institution in turning out Prof. Winchell. American Influence in Civilization, and a graceful and appreciative tribute to the memory of Mr. George S. Appleton, recently deceased, complete the Editor's Table. The remaining departments maintain their usual high standard of excellence.

The illustrations in HARPER'S MONTHLY for August are noteworthy, especially Birds and Plumage. The other illustrated papers, The Golden Age of Engraving, The White Sulphur Springs, An Old-Fashioned Spa, and A Glimpse of Nature from My Veranda, are just the kind of food that pleases the literary palate in the summer. The serials, Macleod of Dare, and the Return of the Native, are probably the two best of the year. The Chinese Question is expounded by a writer who uses John Comprador as an example. It is shown that John is not only able to hold his own among the outside Barbarians, but is equal to beating European traders at their own game in his flowery native land. The Editor's Easy Chair, Scientific Record, and The Drawer are as full and interesting as ever.

ST. NICHOLAS is as sprightly as if he were not a hoary old fellow, but as young as the most enthusiastic of his youthful admirers. Under the Lilacs, and Dab Kinzer are charming serials, so diverse that the tastes of the Magazine's wide circle of readers must be met and satisfied. Jack in the Pulpit, The Letter Box, and the department for the very well people are as pleasant as an iceberg in July.

DEMAREST'S MAGAZINE for August has a colored plate of Rip Van Winkle for a title-page, and it is further embellished with some half dozen full-page illustrations. The stories, excellent miscellany, useful hints on etiquette, and about the cuisine; answers to correspondents, fashion intelligence, with illustrations of the latest novelties in jewelry, ficlus, coiffures, combs and costumes, must interest every lady who is so fortunate as to see a copy of the magazine. The younger people cannot but be pleased with the Young America department.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

IN THE GARDENS OF KEW.

A Memory of 1849.

How well I remember the day that we went!
We sailed up the Thames in the Duchess of Kent;
And we both sat apart from the holiday crew;
And we landed at last by the Gardens of Kew.

And I wore a poke bonnet—they give one the blues,
When one looks at them now in an old London *News:*
But you said I looked lovely—it mayn't have been true—
But I liked it, I know, in the Gardens of Kew.

And Love spread his glorious glamour around
As you told me you'd been down to Fulham, and found
A small house with a lawn and an exquisite view—
O, it sounded so sweet in the Gardens of Kew.

But I doubted—you kissed me, and bade me be sure
That "the gas was laid on and the water was pure"—
It was foolish perhaps; but what could a girl do?
I gave you my heart in the Gardens of Kew.

I was only a governess, toiling till dark,
And you were an underpaid Government clerk;
But though friends said we'd multiplied sorrow by two,
The sum total was bliss—in the Gardens of Kew.

How we loitered and dreamed through the mid-summer day!
Was grass ever so green, were flowers ever so gay?
And a sunset, seraphic as Paradise knew,
Streamed its splendor that night on the Gardens of Kew.

Then the mellow moon rippled the flood with its gold,
And you put your coat round me for fear I was cold,
Though the balmiest zephyr July ever blew
Sped us blissfully home from the Gardens of Kew.

Three months after we took, a poor husband and wife
Our joint ticket, third class, for the journey of life;
We've had griefs, but the power of true love pulled us through—
The love that we sealed in the Gardens of Kew.

And sometimes, though now we have wealth and to spare,
With a house in Hyde Park, and a carriage and pair,
As we take our hebdomadal walk in the "Zoo,"
I cast a fond thought to the Gardens of Kew.

Well, taking the years as they've flashed by us fleet,
The sweet with the bitter, and bitter with sweet,
I don't quite regret it, my darling, do you?—
Our saunter that day in the Gardens of Kew.

[*London World.* H. B. F.

KEEP OUT OF THE KITCHEN.

J. E. M.

Now that the summer heat is upon us, I would urge mothers and housekeepers generally, to spend as little time in a hot kitchen as possible. It may seem like an idle piece of advice to a great many who, like the late Pope, regard themselves as "prisoners," with no chance of escape from their enthrallment. Yet the busiest worker can lessen the hours she spends in its torrid heat, if she will only practice a little headwork over the matter.

In the first place, much work may be done towards preparing meals before the fire is lighted; when the room is at its coolest, vegetables can be prepared, and the baking got well under way before striking the match. Then put on all steam and let the work go on with the greatest dispatch, while you betake yourself to the well-darkened dining-room and set your table, or do whatever work comes next to hand. You can keep your eye well on the kitchen and all its operations, without actually remaining in it.

I have seen women take their sewing into the kitchen on a July day, with the stove in full blast. I would not do it, if I had a wood-shed I could move my chair into.

The desire to keep the house well shut up and in order, induces many a poor woman to sacrifice health and life on that "American Moloch,"—as good Mrs. Blackwell calls the modern cooking-stove. Remember, that nothing you have is too good for you to use, toiling mother, and that too on every day of your life. Do not save up your house and furniture for your children's step-mother; very likely she will never appreciate your sacrifice and will be far more careless in its use than ever you were. Is it worth while to hoard for a stranger?

As far as you can, carry on household operations outside the kitchen. Never iron there. If you value health and comfort, choose the coolest spot you can find to spread your ironing blanket; though it takes a few steps in and out to get your irons, it will save ten times the labor in strength and comfort as you go along. Do not prepare your vegetables beside the hot stove, but take them into the back porch if possible, or some other shaded spot, in the fresh air if you can.

It is attention to these "little things" which are in reality great things, which will bring you through the summer heat with health and vigor unimpaired, instead of laying up in store the germs of a long, low fever, through the fall.

Keep out of the kitchen all you can, and while there, mitigate its severities so far as lies in your power.

THE LITTLE PLEASURES OF LIFE.

ELLA F. MOSEBY.

ONE of these is an observance of family festivals; the remembrance of the children's birthdays, the marriage anniversary, the rejoicing on the day of Thanksgiving, when all the fruits of the kindly earth are gathered and stored away, and the whole household, old and young, come together at the home with which their childish memories are all associated. The good cheer, the smiling faces, the friendly greetings, do much to foster a spirit of mutual love and thankfulness, which may keep a heart of warmth in the working days that follow. No nation, no family, no individual, can afford to lose his days of thanksgiving—the open recognition of the tender watchfulness and liberal bounty of a Divine Providence who numbers all our steps.

The marriage anniversary; how pleasant it is to see husband and wife, who have long borne the heat and the burden of the day, looking back to the joyous dawn of love and its fair anticipations of coming delight, with the earnest trust that all has been fulfilled in a higher and better sense than in their dreams, and that all the experiences of life, the sad as well as the bright, are working out a more perfect fulfillment in the great hereafter. The brothers and sisters in that home love each other more for the love which the father and mother bear each other. That love is like a fountain, sending down its pure influence and power into all the affections, the friendships and charities of the home.

The birthdays come like a succession of fair stones on the chain of gold. The baby's first birthday, with its dimly seen roses, its one summer and spring, and the dainty, pretty gifts that a baby has, the little dresses and wraps of the softest texture and the most delicate colors—all the household loves the baby's birthday! Then, perhaps, that of the big boy of the family—his fishing-rod and tackle, his balls and books of adventure, and kites, that overlop the roofs of the houses, and games to be shouted over. What a contrast it is; but it brings a breezy stir of muscular life and strength that is good for the quiet members of the household, carrying them closely into the out-of-doors flavor and zest of things.

A pretty German custom has upon the table of the birthday party as many candles grouped around the child's birthday cake, in the center, as the years it has lived, beginning with the one bright taper in the middle for the baby's first anniversary, and adding light after light to the brilliant collection of the fifteen-year old son or daughter with the shining ring of lighted candles.

I think the loveliest birthday of all is that of the grandmother—placid, gentle, serene, not caring overmuch for the things of this world, yet full of sympathy for every joy or trouble or care of others. Around her come the older sons and daughters, married and entered upon middle-life, with its responsibilities and labors. Then the younger children, or the elder grand-children, in all the flush of expectation and purpose, the younger ones, reveling in a hey-day of unconscious enjoyments, and, last of all the circle, the infant lying in its grandmother's loving arms, with the same serene look of peace on its young face, that shines in the sweet aged face that bends over its slumbers.

OLD SETTLERS' DAY.

B. C. D.

IN the comparatively newly settled States, there are societies organized in many places called Old Settlers' Societies. A residence in the State of a quarter of a century or more is necessary to gain admission. I had the pleasure of attending the annual reunion of such a society a few days ago. There is always an interest connected with the day which belongs to no other holiday of the year. It is a fourth of July with all the coarse and disagreeable elements omitted.

It was refreshing to see so many old people together, all manifesting such a lively interest in the proceedings. There were vigorous old men and others bowed with the weight of years, yet all enjoyed adding their share of pioneer experience to the common fund. The farmers recalled the time when they sold their wheat for fifty cents a bushel after hauling it to distant markets, and were paid in wild-cat money, which would hardly pass current until they reached home. Business men spoke of the convenience which they regarded a weekly mail in the olden time. The old ladies told of the time when they wore bonnets of such ancient shape that they would have cost them their social position in the Eastern homes where they were reared, yet the equality on which they all stood here made it quite endurable.

Housework in those days required the exercise of the heroic virtues: economy, to make a small income take the family through the year free from debt; energy, to accomplish a large amount of work without any of the modern conveniences; patience, to wait for returns for labor and capital invested in a new farm.

The pleasant-faced, gray-haired old ladies of the audience looked as if they felt rewarded for their early sacrifices, and one and all agreed that they had never taken more comfort in their lives than in those early days in a new country. One of the speakers remarked, that "in comparing the present with the past we seemed to be burdened with too much civilization, there were so many things required to keep up our state, that we exhausted ourselves in trying to enjoy ourselves, and that a departure towards the simple habits of the early pioneers would be profitable to all concerned."

WAITING FOR THE BOYS.

MRS. M'CONOUGHY.

"How I do miss my little sewing chair," said Grace as she seated herself to sew in one of the common sitting-room chairs, "I never feel at home in these chairs. But mine has been disabled six weeks, and I never can get the boys to take it to the cabinet-makers to get it fixed. I suppose a little glue would make it all right in two minutes."

"I would'nt wait for the boys," said Cousin Hester decidedly.

"Take it on my own shoulder and carry down the street? I fancy I see myself."

"No, just step down the street and buy five cents' worth of glue and we can fix it ourselves."

"But we have no glue-pot."

"But we can improvise one; take a little tin can and set it inside a larger one, that will make a first-rate glue pot. Pour a little water in the outside one, and put the glue, with a little water in the inside one, and thus set it on the stove to melt. That is all the fuss there is about making glue. Now there is Willie, who, I know, will do our errand for us, and we will mend his wagon to pay for it."

Cousin Hester was unlike most people. While they talked of doing things, and exploited on what a good idea it would be to have them done, she went to work and *did* them. So it was not an hour before she was tinkering that rocking chair which only needed a rocker glued on, and tied fast with a string for a day, and thus it was as good as new. Willie hovered around delighted to see his little wagon once more put in order; there were too or three books whose corners were glued on, and then Gracie remembered her Sunday fan which had a stitch broken. A tiny drop of the strong glue was enough to make that all fast, and thus the children set out to explore the house, and see what else needed mending. There seemed enough virtue in that five cents' worth of glue to put together a houseful of loose pieces. In fact they did not know how much things were out of repair until they came to look into the matter, nor how snug and comfortable they would feel to have the furniture all safe and sound again.

In the afternoon Grace and Hester warmed up the glue again and sat down to make the prettiest kind of a shell and rice frame, a little chromo for the mantle.

"Never wait for the boys to do what you can just as well do yourself, Grace," remarked Hester. "I never do; I can pound a nail as well as the best of them, and harness a horse, or dig up a flower bed; and you can learn, dear."

UNCONSIDERED TRIFLES.

IN making up handsome costumes, ladies buy a cheap silk for the skirt proper, as the trimming used upon the foot covers it, and the richer material is thus saved for more important portions of the toilette. Skirts are seldom lined now-a-days, and ladies think they wear quite as well if they are not stitched up with too fine a thread and too close a tension of the sewing-machine.

A great deal of work that once was thought important is now known to be of little consequence, and so, instead of carefully blind-stitching or hemming flounces, these are very generally prepared by the sewing-machine. The best French dresses are made almost entirely by machine-work, but in this country ladies prefer trimmings at least arranged by hand-work, unless in the case of muslin and other wash-dresses.

It is no economy to use black thread for hemming black silk flounces, for long before the dress is worn out the black thread is green, blue, or yellow, and shows a marked line wherever it has been used.

A fanciful style of trimming on a plain material or a showy mixture of colors upon a dress which is to be worn for service, only makes a poor return for the thought and labor expended. Some of the prettiest dresses recently prepared were made of striped seer-sucker, at twelve cents a yard, trimmed with a braid lace with a crocheted edge.

Some of the pleated yoke dresses sold in the shops this summer have been lined throughout, making them too warm for comfort. It is only the yoke which requires strengthening; the sleeves and pleated body are more satisfactory if not lined.

In remodeling it is easy work to cut off the long or old-fashioned fronts of polonaises and make the reversed apron, called the "washerwoman's;" the pieces cut off require to be fitted to the outline of the front, and the back may be draped in any way most liked, or most easily done with the material in hand.

Sometimes, in renovating a dress, the fabric is so handsome, and looks so new after having been turned, pressed, and generally revived, that a new trimming seems indispensable. In the case of really good material, it is economy to provide this, as the second wearing of a dress is frequently more satisfactory than the first, in every sense. This is always the case where the frugal woman has spent all the money devoted to a dress upon the bare material, exclusive of the trimming.

Buyers, or other managers, find the new Bonaz embroidery a great convenience in the work of renovation, as the manufacturers will supply it in every shade, and of every combination, at nearly the same price as is asked for it in the shops. Most of the blended embroideries on lace are also excellent garnitures, to which the perplexed economist may resort when a shade that is not at the moment a leading tint of fashion, is to be provided with a match or a contrast of color.

Industrious ladies will be glad to know that some of the handsomest piece trimmings promised for the autumn trade, are bands worked with fine split zephyr, in long sketchy stitches—effective but extremely simple. Borders worked in this manner will be used as headings, above lace or fringe.

CALIFORNIA is, for women, the modern Utopia, a judge of San Francisco having decided that under the laws of that State, a wife has full and exclusive control over her own property, and is competent to execute morigages or transfers of real or personal property held in her own right. In the words of the decision, the laws of the State are "intended to make the wife entirely free from the husband's care and guardianship and more free and independent in all things than the husband himself."

Domestic Economy.

CONDUCTED BY EMILY MAPLE

ABOUT MOSQUITO NETTING.

In the first place, buy it by the piece. It will probably cost half-a-dollar, and will cover all the sashes for windows that you will require—probably—and enough be left for a door or two. Most people know its value in summer time, but there are many farmers' families that do not, and upon such I urge its use. It saves in labor, ten times its cost in labor and money. It adds to the comfort of a room, beyond measure. Anybody who is clever with a carpenter's tools can make frames enough for doors and windows, in two or three days of the winter time, when there is no other driving work. Especially for the windows and doors of the dining-room is the netting a necessity for keeping out the flies. The frames for the doors should be hung on hinges, such as will admit of their being lifted off after the reign of the flies is ended. Nothing is more tantalizing and vulgar than to sit at table in a swarm of flies. With netting at the windows and doors—especially the outside door, if there be one—the room may be darkened between meals, leaving a tiny crack for the flies to crawl out, and in such easy wise, the room may be kept comparatively clear of them. Try it, and be gratified. MARY WAGER-FISHER.

Bryn Mawr, Pa.

MOP-HANDLE PAPERS—NO. 2.

I HAVE had occasion to wonder on cleaning days at the carelessness of house-keepers, who have little toddling children just beginning to run about. Perhaps I ought not to call the fault *carelessness*, but there surely must be a lack of calculation when the mother can not clean her kitchen floor—and, as it frequently happens in country places, the kitchen includes the nursery—without the use of boiling water. In how many incidents do we read of children being scalded by falling into the pail of boiling mop water! And all too often are we obliged to witness the agonies of the little household pet who has met with this frightful accident. The afflicted mother presses the darling to her heart, and crying over her own negligence, moans: "If I had only watched my darling closer, or tied him in his high chair out of the way, I might have kept him with me for long years to come, but now I must witness his dying agonies, and know that I am to blame for all this suffering and for the loss of his precious life. How can I ever forgive myself!"

And yet, strange as it may seem after such stern experience, the very next cleaning day, although there are other little toddlers about, she must heat the water to its boiling point, as though no other degree of temperature would do the work as well.

Now, I know from experience that luke-warm water, or even cold water, will cleanse wood from all ordinary impurities. I do not pretend that it will bleach a floor; but is it necessary that it should be snow-white? If it is, why not *paint* it the desired color, and thus save one's-self a "deal" of hard work, and do away with the last chance of scalding the little ones to death.

An innocent, God-given life and a clear conscience are of vastly more importance than a chalk-white floor. So I enter an earnest protest against the use of boiling water for cleaning purposes, so long as there are helpless, toddling children in the house or vicinity.

MAY MAPLE.

DOMESTIC RECIPES.

Blackberry Pie.

Make the paste as usual, and place the under crust upon a deep tin, and the upper one, cut the right size, on a flat tin; prick both crusts to prevent blistering, and bake until nicely browned. Fill the under crust, while hot, with *ripe* blackberries; sprinkle powdered sugar over them, cover with the flat crust, and return to the oven for a very few minutes—just long enough to heat the fruit. This pie may be served with cream and sugar, and, according to our taste, is preferable to the average berry pie with its soaked and heavy crusts. E. M. B.

Carbonate Ammonia Cookies.

For the benefit of Mrs. Martha Hinds, I send my recipes for the following:

One ounce of carbonate ammonia, one pint of sweet cream, two teacupfuls of sugar, half a grated nutmeg, and flour to roll very thin.

Ammonia Sponge Cake.

Three eggs, one cup of sugar, one cup of flour, one tablespoonful butter, one teaspoonful pulverized carbonate of ammonia, dissolved in a very little hot water and added the last thing. Flavor with nutmeg. MRS. M. ALDRICH.

Baked Tomatoes.

Scald and peel a sufficient quantity of smooth, round tomatoes; put into a deep earthenware dish, sprinkle plentifully with salt and pepper; have a teacupful or more—according to the quantity of tomatoes—of fine cracker crumbs, and spread over the top. Bake in a quick oven from thirty to forty-five minutes. Drop a few lumps of butter onto the tomatoes and serve.

Tomatoes on the Half-Shell.

Have toasted a few slices of bread nice and brown; butter, cut in half, and place where it is warm. Select tomatoes which are smooth, and not over-ripe; cut in two—flat-wise—and put, skin down, on a hot grid-iron; serve on slices of toast with butter, pepper and salt. We have eaten them with a teacupful of hot cream poured around the slices of toast and tomatoes—the addition of which did not improve them to our taste.

Scalloped Tomatoes.

Peel as many ripe tomatoes as required; cut into slices, and place in a pudding dish first, a layer of tomatoes, seasoned with butter, pepper and salt, then a thick layer of bread crumbs, also seasoned with butter, pepper and salt. Thus alternate the layers until the dish is nearly full, having tomatoes last; cover tightly, and bake one-half hour or longer if the oven be not hot.

Tomato Soup.

Take of a neck piece or from the round, two or three pounds of beef; remove every particle of fat, and cut the meat into very small pieces; put into the kettle, with two or three quarts of cold water, and simmer for one hour; as the scum arises, remove, and keep the kettle covered; strain the meat from the broth, and add a quart of tomatoes, which have been pressed through a colander, with a bunch of parsley, and boil twenty minutes; cut and scrape the kernels from three ears of sweet corn, and add to the soup, with a half teacupful of sweet cream, two small tablespoonfuls of flour, pepper and salt; boil fifteen minutes and serve.

Tomato Salad.

Skin, remove the seeds and pulp from fresh tomatoes; chop what is left with the heart—if it may be so called—of a cabbage and a little parsley, and serve with a good salad dressing.

Cucumber Relish.

This pickle may be made from those cucumbers which have grown too large for pickling whole.

Peel, cut in half, remove the seeds, and grate on a coarse grater; drain the water from the mass, season highly with pepper, salt and ground cloves, cover with cold vinegar, bottle and seal.

Stuffed Eggs.

Boil ten eggs until hard; plunge into cold water for a moment or two, remove the shells, cut in half, take out the yolks, chop, and mix with them some chopped cold chicken or veal; season with a little parsley, pepper and salt, and with a little melted butter, shape into a form to fill the cavities; press the two halves together; roll first, in a beaten egg, then in bread or cracker crumbs, put into a wire vegetable basket, and dip into boiling lard; when delicately browned serve with a tomato sauce. E. M.

QUERIES ANSWERED.

Stuffed Ham.

PLEASE give directions for stuffing a ham.

E. B.

ANS.—Wash and scrape the skin until it looks white and clean; cut out quite a large piece from the thickest part—which by the way may be used for frying—and steam four hours. The skin should be left as whole as possible on the ham as it answers for a sort of cape for the stuffing. Fill the space cut out with a dressing of bread-crumbs, seasoned with pepper, salt, sage, a little onion if liked, and all mixed together with a couple of raw eggs; bind a strip of cotton cloth around to keep in place; score the skin in slices a quarter of an inch deep and bake an hour and a half, turning so as to brown on all sides. The last half hour sprinkle with bread crumbs and baste frequently with butter and water. Many peel off the skin before baking and cover with a regular cake-icing just before it is done—it should be then left in the oven only long enough to brown.

Stuffed, baked or boiled ham, providing it has been nicely cured, can be made into the most tempting and healthful—so the writer thinks—dishes. The nicest portions may be cut into slices and served, while the ragged parts may be chopped fine and with pickles and other ingredients be made into sandwiches, omelet, grated ham on toast, etc.

News of the Week.

POLITICAL.

Monday, July 29.

The National party, now generally known in this State as the Greenback-Labor Party, held a convention at Syracuse on Tuesday and Wednesday. The greenback element of the party from the outset took control of the assembly, completely throwing the labor party into the background. Three sets of rival delegates, belonging chiefly to the later faction, presented themselves for admission from this city, but all three were stoutly excluded. In the main, the body was made up of farmers, country merchants and labor representatives, together with a fair sprinkling of lawyers, political enthusiasts and other adventurers. The political papers are loud in their sneers and jeers at the scenes of excitement, disturbance and recrimination that took place, but in reality, judging from even prejudiced accounts, these were hardly worse than those witnessed at most conventions of democrats or republicans.

They nominated Gideon Tucker as Judge of the Court of Appeals, and adopted a platform demanding, in brief, repeal of the Resumption Act; the withdrawal of national bank notes; the issue by the government of irredeemable legal tender notes receivable in payment of all debts, and the immediate payment of the whole of the national debt in such notes; a protective tariff upon all articles grown or made here; a graduated income tax, bearing heavily on the very rich, and more lightly on the less wealthy; a wise and judicious system of internal improvements; the adoption of a tax designed to limit the amount of land one man can own; a prohibition against competition with convict or Chinese cheap labor, and a few other planks of minor importance.

This seems to be a fair sample of the principles of the party throughout the country, judging from the platform adopted by it at the late convention in Ohio, and from other authorized declarations. Among many thoughtful men in this section, the notion is growing strong that the system of contempt, abuse and ridicule, with which this party has hitherto been generally treated by the Eastern press, is a false one; and that the principles of the new organization should be combatted by arguments as seriously and temperately as are the principles of the old political organizations. An allied organization, known as the Knights of Labor, a secret and professedly non-political party, claims a membership throughout the country of 870,000, of whom 500,000 have joined within the past year.

Yesterday morning Kearney, the California agitator, arrived in Boston, after a journey of eight days from San Francisco. Shortly after his arrival he was waited upon by a large crowd of workingmen, to whom he made a speech full of boisterous language—death to monopoly! death to debased capital! death to Mongolian as well as to African slavery! death to political plunderers!—blood-suckers of all parties, etc! etc! etc! Afterwards he attended a meeting—with his mother—a respectable, old Irish woman, who had not seen him for fourteen years. He goes in for Butler for governor of the old Bay State.

Sherman, Garfield, Trumbull, Kelly, and a number of other visiting statesmen, were before the Potter Committee during the week at Atlantic City. Their testimony directly contradicts that of Anderson and other "Fraud" witnesses on most points; but the public, all over the country, are getting tired of the endless mass of contradiction, perjury and corruption, and RURAL readers will, doubtless, wait with patience for a synopsis of the evidence later on when all is in, and it is possible to arrive at some definite conclusion as to its bearing and importance.

MISCELLANEOUS.

A farmer near Faribault, Minn., shot and instantly killed a couple of tramps whom he caught setting fire to a harvesting machine in his wheat field. He surrendered to the authorities, but was immediately released. The railroad presidents lately held a conference at which it was recommended to the Western roads to advance grain rates from Chicago to New York from 16 to 20 cents, and other freight in proportion. Another monster defalcation in Boston! The guilty party this time is John G. Tappan, Treasurer of the Boston Belting Co; President of the McKillop and Sprague Commercial Agency Company of this city and largely engaged in several other branches of business. His misappropriations will probably amount, when all are discovered, to over $1,000,000. He has surrendered property nominally worth that amount and claims sympathy for his dishonesty. It is the old story of reckless speculation. There has been a scare in Brooklyn and this city at the appearance of half a dozen cases of yellow fever on board a government vessel lately arrived from the West Indies. No new cases have appeared, however. The pest has already made its yearly visit to New Orleans, where some 40 odd deaths have already taken place, and that city has been quarantined by Memphis, Shreveport, Galveston, Mobile, and Pensacola.

Three men were killed and four others seriously injured by the explosion of the boiler of a threshing machine near Belleville Ill, a week ago. Such items might truthfully be very common for the next couple of months at least. A meeting of about 200 of Jay Cooke's creditors met a week since in Philadelphia. But after waiting five years they could learn nothing of the sum they are likely to get out of the assets of the bankrupt. As yet only five per cent has been paid on the $5,000,000 for which Cooke failed; and naturally some indignation is felt at the delay in closing up the estate. But then the receiver etc., would lose their present fat salaries and pickings. Forty per cent, it is hoped, will ultimately be realized from the assets. By a decision just rendered by Secretary Schurz all land granted to railroads to help to build them, and which have not been sold within three years from the date of the entire completion of such roads, are declared to be subject to the right of pre-emption at $1.25 per acre. It is unjust that these lands, after having been accepted distinctly on this condition, should be indefinitely held at much higher prices or for speculative purposes. This righteous decision will throw a vast extent of excellent land open to settlers on favorable terms, and though the Supreme Court has not yet been called upon to decide the question, it has given undoubted indications that its decision would coincide with that of the Secretary of the Interior. The land is some of best to be found, lying, here and there, right along the railroad and never far from it, and therefore it is probable most of it will soon be "entered."

Gross frauds in the accounts of the Indian Agent at the Crow Creek reservation have been discovered by Gen. Hammond, a recently appointed Indian Agent. The Government has been charged for a vast quantity of goods never purchased; agents, clerks and employes of all kinds, together with their families have been supported on supplies that ought to have been distributed among the Indians; trains to the Black Hills have been loaded with goods from the same source, and every form of peculation infamously practiced. The thing has been going on for years, enriching numbers of public plunderers, but just now the detected culprits are Dr. Livingston, the agent, and a number of subordinates, all shining lights of the Episcopal Church. It is much to be feared that this robbery is only a flagrant sample of what is going on, or has been going on, at many other Indian agencies. Out in Oregon, friendly Umatillas under Gen. Forsythe, have contributed greatly towards ending the war by falling upon the hostiles near Baker City, utterly routing them, and capturing many scalps, women and horses. Subsequently Howard joined Forsythe. The combined forces followed hot upon the trail of the hostiles, who soon separated, the Piutes heading for their reservation, probably there to surrender, and live on Uncle Sam until the next outbreak, and the Bannocks making for Camas Prairie and Capt. Jack's famous Lava Beds, which they too may use as a stronghold. It is thought, however, that this war is now virtually over. The Sioux, under Spotted Tail and Red Cloud, are about to move peacefully and contentedly to their new reservations on White Earth River and White Clay Creek, Missouri.

In the year ending June 30, 1879, the entire appropriations made by Congress for the benefit of all Indians amount to $4,741,076, and besides this, some of the tribes are nearly self-supporting, others have annuities from the proceeds of the sale of their lands, etc.; while a few claim no assistance; yet the chief cause of Indian disturbances every year is a scarcity of supplies. If, in addition to the above sums, we take into account the injury they do in war, the expenses of the army needed to keep them in order, and the value of their possessions, it would seem a cheap plan to bring them all East and board them at first-class hotels.

Sugar-cane culture is extending into all the Gulf States, and as far north as Georgia; the area under cultivation this year is considerably larger than hitherto, and the outlook is promising. The wool clip is about three per cent. larger than last year. There has been a falling off of 5 per cent. in New England, of 3 per cent. in the three northern Middle States, and of 9 per cent. in California, and an increase everywhere else, amounting to as high as 14 per cent. in North and South Carolina, Georgia, Florida, Alabama and Tennessee, with a very large increase in Texas also. A considerable weakening in prices, however, is indicated. Tramps are busy committing all manner of outrages through the country. A partial list of their crimes during the past week, as reported in the RURAL exchanges, would fill a couple of columns. The patience of farmers is getting exhausted, and it is not improbable that ere long many districts will be made too hot for the reckless vagabonds.

FOREIGN.

Escobedo, the Mexican general chiefly implicated in the death of Maximilian, and who has lately been trying to effect a revolution in favor of Lerdo across the Rio Grande, has been captured by the troops of Diaz, taken to Monteray and sentenced to death. A couple of weeks ago he issued a pronunciamento violently denouncing Diaz, and threatening him with Maximilian's fate should he ever fall into his hands, and accordingly he has but little right now to expect mercy from his captors. Gen. Mackenzie has crossed into Mexico at the head of 800 men in pursuit of cattle thieves. A strong party from the Texas side of the Rio Grande have retaliated on Mexico by stealing a large number of cattle from the other side of the river. There is doubtless a large number of men throughout Texas trying to embroil this country in a war with Mexico in expectation of feathering their nests with the results of land and other speculations as well as by the fat contracts that must then fall into their greedy hands. Many emigrants from this country have lately been induced to go to Brazil; but most of them are trying to get back by sending to their friends for money or by working their way on shipboard. They soon grow sick there, many of them die, the others get disgusted with the climate, the fare, the natives, broken promises, and their own foolish expectations.

Across the Atlantic lords Beaconsfield and Salisbury have both been made Knights of the Garter, in reward for their diplomatic services. Much dissatisfaction, however, exists among the majority of Liberals at the responsibilities put upon England by the late treaty; at Desraeli's consent to Turkey's dismemberment and his share in its spoliation; and at the Conservative triumph generally and the defeat of the policy they themselves advocated. Austria is ready to cross the frontier into Bosnia, although the Porte has not yet formally consented, and most of the inhabitants oppose the movement. The republican party in Italy are violently agitating for the cession by Austria to Italy of the southern part of the Tyrol about Trent, as well as of Trieste. Garibaldi has just written a letter warmly approving the popular demonstrations being made in favor of the annexation. The Italian government is opposed to the project; Austria disregards it; and Bismarck says such a measure is now and always will be inconsistent with German interests. The Russians are still negotiating for the purchase of fast vessels to be transformed into men-of-war, and people are naturally asking why so. Shumla has been evacuated by the Turks and occupied by the Russians; Varna is soon to share the same fate; whereupon the Muscovites will retire from before Constantinople. Peace is causing a brisker business and better times through most of Europe.

HERMAN.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 27, 1878.

*BEANS AND PEAS.—In Mediums there is no special change to note; summer buyers make careful selections, and pay the extreme for small parcels. Marrow have a fair demand; extras have sold a shade above quotations. Stocks here in general are light compared with last year, but the fact does not help prices, as there is quite a large surplus in the country. Crops are looking well, but they are yet not beyond possible disaster. Red kidneys are in few hands, and have again advanced. White quiet. Peas firm for choice Eastern qualities. Canadian peas are scarce and stronger, 77@78c. for good and 80c. for choice, to arrive in bulk and bond. Green peas ll m at $1.20; do. B. E. peas steady for old at $3@3.25. Receipts of beans past week, 1,084 bush.

Exports, 775 bbls. Exports of peas, 1,087 bush.

We quote medium beans, prime, $1 55@1 57½; fair to good, $1 35@1 50; marrows, prime, free on board ship, fair to good, $1 57½@1 60; Pea, $1 40@1 65; white $1 60@$1 62½; kidney, $1 40@1 60; red do., $3 25@3 50; black $2 35@2 40; Lima, $3 75@4 25.

BEESWAX.—Exporters have taken small lots at 26½@28c. for Western and Southern.

Exports past week, 2,313 lbs. Since Jan. 1st 110,200 do. Same time last year, 75,628.

BROOM CORN—Has a light sale, pending marketing of the new crop. Quotations are: 6@6½c. for hurl and short brush; 5@6c. for medium green, and 4@4½c. for red and red tipped per lb.

BUTTER.—Supplies are liberal, but the want of really fancy has been felt more during the week than for the season. In fact, butter that has had the favorable features of fine quality, and near-by make has had almost a special market. To some degree the higher prices of extra selected creamery and faultless pails has stiffened some well-kept marks of remote made, but wholesale buyers can do about as well as they did last week. Exportation is of great assistance to the summer market, only the call it makes upon high-priced stock, is something New York has not been used to. Still this will be in the future interest of producers, and sellers put up with more or less grumbling on the part of local buyers. Western butter has a good run, as prices are decidedly in its favor: quality compared with State. Refrigerator space is lower on steamer; about 20,000 pkgs go abroad in this week's fleet.

Exports for the week, 23,909 pkgs.

State creamery, choice, 22c.; other, 19@21c.; half tubs and pails, choice, 18@19c.; other, 12@17c.; Welsh tubs, best, 16@17c.; other, 11@13c.; poor State, 8@10c.; State firkins, 16@19c.; Western creamery, choice, 20c.; other, 16@19c.; Western dairy, best, 13@14c.; other, 9@12c.; factory (ladle packed), 9½@10c.; other, 6½@8c.; milled Western, 5½@8c.; old and grease, 3@5c.

Receipts for the week, 33,772 pkgs.; do. past week, 30,149 do.

COTTON.—There has been a brisk movement in spot cotton, and considerable inquiry as well from the "shorts" has tended to the higher prices. Latest quotations are for July, 11.7½c. for August, 11.73@11.7½c.; September 11.41c.; for October, 11.25@11.26c.; for November, 11.09@11.10c.; for December, 11.07@11.08c., for January, 11.11@11.12c.; for February, 11 17c.; for March, 11.25@11.26c.; for April, 11.31@11.33c. May, 11.40@11.42c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	9¾	9¾	9⅞	9⅞
Strict ordinary	10¼	10¼	10¼	10¼

Fair	13 9-16	13 9-16	13 11-16	13 11-16

Stained.

Good ordinary..... 9¾; Strict good ordinary. 10¼

Low middling..... 10⅝; Middling..... 11 3-16

CHEESE.—Shippers this week have been a little inclined to hold off since the English markets have been slack, and fully stocked by the large shipments that have been made thence. Receipts have been large again here, and although prices have declined there is left a larger accumulation to be carried over than previously this season. Latest sales are at 7¾@8c. for fancy white and colored.

Quotations are for fancy, 7¾@8c.; 7@7½c. for good and prime; 6x6½c. for fair; 4@6c. for half skimmed; 2@3½c. for skimmed. State, farm dairy at 6½@7½c. for good to choice, 5@6¼c. for fair to good, and 2@3c. for poor skimmed. Wisconsin factory, fine to fancy, 7½@8c.; do. good to prime, 6½@7¼c.; do. fair to good, 5@6¼c.; Western factory, fine, full cream, cheddar, 7@7¼c.; do. fine, full cream, flat, 6½@7c.; do. slightly skimmed, flat, 6@6½c.; do. half skimmed, 4@5½c.; do. full skimmed, 2@3c.

Exports, 88,305 boxes.

Gold closes, 100¼.

Liverpool cable, 45s., which is better.

DRIED FRUITS.—Small lots of new blackberries have been placed at 7@7¼c., and new cherries at 13½@14c. The general market is yet very dull. New blackberries, 7@7¼c. Peaches—Georgia at 7@8c.; unpeeled halves, 3½@4c.; quarters, 3@3½c. Pitted cherries, 13½@14c.; New York State plums, 12@12½c.; southern plums, nominal. Apples—State quarters, 3½@4c.; do. sliced, prime, 4½c.; good, 3½@4c.; western quarters, 2@3c.; southern at 4@4½c. for prime sliced; 3@3½c. for fair to good; southern quarters, 2@3c.; Tennessee quarters, in bags, at 1½@2c. New raspberries, 22@23c., and evaporated, 26c.

Exports past week, 90 bbls. dried apples. Since Jan. 1st, 10,050 do. Same time last year, 23,125 do.

EGGS.—Receipts for the week, 7,913 bbls.; do. last week, 7,107 do. Eggs are turning out so badly that buyers are neglecting nearly all marks; in Western and State a few shipments have a steady hotel and restaurant trade, but generally buyers will not invest even with the most liberal loss off included.

Near points, 14@15c.; State and Penn., 12@13c.; fresh Western and Canadian 10@11c.; inferior and ice-house that have missed a prompt sale after exposure, 8@10c.

FRESH FRUITS.—Apples are in good supply and bring very fair prices. Nyack pippins, bbl., $2@2 50; Sweet and sour boughs, $1.50@2; Astrachan, poor to fine, $1 50@2 50; Windfalls, 75c.@$1 25. Southern pears are making quite a display: Va. Bartletts, $2@4 crate; Georgia, $5@6 do.; Bell, barrel, $5; Common to good summer pears, $2@4. Whortleberries, $3@3.50 bush. Raspberries scarce, close higher; it has been a poor season for growers. Antwerps, 4@5c. thirds; Blackberries have sold very low, but now show some recovery; Wilson's 6@10c. quart; Lawton's 6@8c. Peaches arrive in limited quantities, rather endorsing the reports of a light crop: Geo., crates, $2.50@4.50; Tenn., $3@4.50; S. C., $3@4; N. C., $2@5; Md. and Del. Troth's, $2@2.50; Hales, $1@1.37. Melons in good supply and easier. Chas. and Augusta, Watermelons, $22@35; N. C., do., $10@25; Muskmelons, $2.50@4. Peanuts are unusually slack for summer; prices almost nominal. Va., hand-picked, $1.55; good to choice, $1.25@1.45. A late car-load of Cal. plums sold at $5 a box for McLaughlin, Purple Duane, German Prune, and Columbia; Hot-house grapes, Black Hamburg, lb., 50@75c.; Muscat, 50@75c.; Sweet water, 40@50c. The western crop of cranberries will be larger; easterward fair.

SUGAR—Refined at 10 for cut-loaf, 9⅞ for crushed; 9⅝ for powdered; 9⅜ for granulated; 8¾@9¼ for soft white, and 8¼@8 for soft yellow.

FLOUR.—The Minnesota grades have been especially active and higher; this is due largely to expected deficiency in qualities of the Minnesota wheats this year, otherwise there has been more activity and a strong market.

Latest prices are $3.35@4.00 for very inferior to very choice superfine State; $4.00@4.20 for poor to very good extra do, odd lots and lines; $4.20@4.50 for good to very choice do.; $3.35@4.00 for very poor to very fancy superfine Indiana, Iowa, Michigan, Ohio, &c., $4.00@4.20 for inferior to good shipping extra do. and $4.20@4.50 for good to very fancy extra do.; common to about choice white wheat extras, $4.30@5.40; choice to very fancy do. at $5.50@6.50; red and amber winter wheat, inferior to very choice trade and family at $4.15@5.75; round hoop Ohio at $4.00@$4.30, and trade and family brands of do. at $4.35@$5.75, the latter rate for choice, (very choice to fancy lots quoted higher); St. Louis, $4.25@5.00 for very poor to good extra, and $5.00@6.25 for good to very fancy; Minnesota clear, very inferior to very choice at $4.20@5.65; Minnesota "straight," very inferior to very fancy, at $5.15@7.00, few genuine brands of this class going under $5.60@5.65, and patent poor to strictly fancy at $5.50@8.50; unsound stock at from $2.00@5.25; city mill extra at $5 00@5.35 for West Indies (the latter rate for fancy in new packages); do. for England, 4.10@$4.25; do. trade and family extras, $5.05@6.15; do. for South America, $5.25@5.85 for fair to fancy; No. 2 $2.25@3.25 for inferior to fancy.

CORN MEAL.—Is selling at $2.85@2.90 for Brandywine, and $2.15@2.35 for Western yellow.

GRAIN.—For wheat through the sharp, speculative manipulation, and buoyant Western markets, with improved English markets, prices are decidedly higher. Corn has also been active at an advance, and oats have sold a little better.

Latest sales of wheat are of No. 1 red at $1 12; No. 2 red at $1 10@$1 12; do., July option, at $1 11@$1 11⅛; do., August option at $1 07@$1 08; do., September option, at $1 06⅞@$1 07; steamer No. 2 red at $1 10; old amber Michigan at $1 15@$1 15½; ungraded red, August 1st to 25th, at $1 07⅛; ungraded white western at $1 07@1 19; ungraded red at 90c.@$1 12; amber Delaware at $1 12; No. 3 red and No. 3 steamer red at $1 05; No. 1 white choice old, at $1 24; steamer white at $1 15; No. 1 white, August option, at $1.19; do., August, September and October options, equally divided, at $1 19; No. 1 amber round, to arrive, at $1.14; do., spot, in lots, at $1 12@$1 14; No. 2 amber, at $1 10@1 11½; do., to arrive next week, at $1 11; do., steamer grade, at $1 08@1 10; New York No. 2, spring, at $1 08@$1 09; do., July option (in settlement), at $1 09¾; do, August option, at $1 05; do., September option, at $1 01@$1 01¾; No. 2 Northwest spring, July option, $1 11. Rye at 66c for State and 62@63c. for western. Corn at for—No. 2, July option, at 48¾@48¾c.; No. 2, August option, at 48¼@48½c; No. 2, September option, at 49½c; steamer mixed, July option, at 48c.; do., August option, at 47¾@48c.; do., September option, at 48¼@48¾c. The spot lots included New York No. 2 at 48½@48¾c; New York No. 3 at 46¾@46¾c.; steamer mixed at 47@48½c.; ungraded mixed western at 45@49c., and white western at 53c. Oats at for—New York No. 1 white at 37@38½c; New York No. 2 white at 34¾c.; New York No. 1 at 35@35½c; New York No. 2 at 34½c.; white western at at 33@38c., as to quality; mixed western at at 32@33c.; white State at 34@37½c.; mixed State at 32⅝@34½c; new white southern, poor, at 30c.; New York No. 3 quoted at 32@32¾c.; New York No. 3 white quoted at 33½@34c.; New York extra at 35½c.

HAY AND STRAW.—There is a good sale for prime stock, of which the receipts are moderate; common lots are plenty and easy in price.

Bale hay, 45@55c. for shipping, and 60@75c. for retail qualities; Straw quoted at 40@45c. for long rye, and 40@45c. for short rye; and 30@35c. for oat.

Exports past week 2,360 bales. Since Jan. 1st, 40,900 do.; same time last year, 29,375 do.

HOPS.—Small lots have been taken by brewers at steady prices.

Emmet Wells says, in his circular, "Some of our exchanges are beginning to give estimates of the coming crop, a few putting the yield at one-half, and others at two-thirds of last year's, but they leave the growers in the dark as to what they consider the amount of hops grown last year. Estimates of the 1877 crop ranged all the way from 130,000 to 300,000 bales. Our estimate, as will be seen by referring to circular September 7, 1877, was 200,000: this was before the crop was entirely gathered. We now believe it reached nearer 250,000 bales, therefore putting the consumption at 125,000 bales. If we grow only one-half the amount we did last year, we will have just enough to carry us through, leaving none to spare for export, but if the yield equals two-thirds of last year's we shall have 40,000 to 50,000 bales surplus."

Quotations are for New Yorks, good to prime, 10@12c.; do., low to fair, 7@9c.; Eastern, 7@10c.; Wisconsin, 7@10c.; Yearlings, 2@ 3c.; Olds, all growths, 1@2c.; Pacific Coast hops, 10@12c.

Exports for the past week, 179 bales.

LEATHER.—Sales at 19½@20c. for light 19½@21½c. for middle; 20@21½c. for heavy and 17½@19c. for good damaged.

POULTRY AND GAME.—Chickens have declined under very free receipts. Fowls are lower, but held up better than other sorts. It is useless to send any but small hen turkeys at this season. Spring ducks are in fair demand when large and fine. Sprlug chickens, N. J. 15c.; State 14c.; Western, 12@13c.; Southern 12@13c. Fowls—N. J. 12@13c.; S. & W., 11@12c.; Roosters, 5@6c. Turkeys 11@14c. Ducks—Choice, pair, 70@75c.; other 40@85c.; Spring 50@75c. Geese—Choice, $1.25@1 50; other 88@$1.12.

City dressers have the run of the market trade in very hot weather; some buyers prefer fresh killed to best ice packed. Fowls and chickens quoted easier, especially for dry picked. Dry picked turkeys, 15@16c.; other, 13@14c.; spring chickens, Phila., 16@18c.; N. J. 15@16c.; S. & W, 12@13c.; Pa. fowls, 14@15c; N. J., 12@14c.; State and Western, 10@12c. In game, wild stuff-fed pigeons quoted $1 25@1 37 doz., for full grown; young, $1@1 12 for small. Tame squab $1.50.

PROVISIONS have hardened a little in price, through increased demands for supplies. Mess pork quoted $10 35@10 60 for spot lots; $10 30 for July and August; and $10 40 for September. Bacon at 6¼c. for long clear and 6⅝ for short clear. Lard—Western steam at $7 35 for new and $7 42½ for old; $7 32½@$7 35 for July and August deliveries; $7 40 for September, and $7 45@$7 47½ for October. Stearine at 9½ for choice city and 9⅜ for western. Tallow at 6 15-16 for prime. Beef hams at $21 50. Beef—for extra mess, $11 75@$12; plain mess, $10@11 50; packet, $11 50@12 25 for bbls, and $16@17 for tcs.; family at $13@14; extra India mess, $19@20 for city brands; do. Philadelphia, $18@$19.

TOBACCO.—Export trade is fair, and prices are strong and unchanged. Quotations are for

LIVE STOCK MARKETS.

Saturday, July 27th, 1878.

BEEVES.—Receipts for the week, 11,213 head; do., last week, 11,316 do. Supplies still heavy for the season; few steers bring the extreme. Texas steers 7½c. pound to dress 55 pounds to gross cost; light Cherokee, 8c. some estimate; ordinary to strictly prime native steers, 8½@10¼c.; export grades quoted 9¾@10¼c. Shipments to Europe for the week, 1,850 live; 600 dressed.

COWS AND CALVES.—The sales have included fair to medium milkers at $30@50.

VEAL CALVES.—Receipts for the week, 3,107 head; do., last week, 3,621 do. Ordinary to good milk have sold well at fair prices, 5½@6¾ for good State and best N. J. Buttermilk 3@5½c.

SHEEP AND LAMBS.—Receipts for the week, 23,216 head; do. last week, 27,119 do. The market has ruled quite steady at 4@5½c. for sheep, the latter for selected wethers. Lambs, N. J., 6½@7c., the latter for fine 60 pounds average: other 5½@6½c.

SWINE.—Receipts for the week, 19,042 head; do. last week, 20,019 do. The supplies, as heretofore, have arrived chiefly to city killers. Nominal price of sale, hogs, $4.75@4.85 per 100 pounds.

Farmers and Gardeners,
LOOK TO YOUR INTERESTS!
THE VITATIVE COMPOUND,
Or Seed and Plant Invigorator.
The greatest discovery of its kind of modern times, for increasing the vital force and early maturity of Seeds and Plants. Patented April 21, 1874.
Early Maturity, Sure Crops, Large Yields, and
DESTRUCTION OF INSECTS.
Better than Guano or Plaster, at a fraction of their cost. The Compound is applied directly to the seed before planting, and its chemical properties insure speedy and certain germination, and by creating an artificial warmth aid the young shoot in its first stages, completely overcoming the dangers incident to wet, cold or late springs, and at the same time protecting the seed and shoot from the ravages of worms or insects. Put up in neat packages of three sizes—the smallest sufficient for a peck, the medium for a half bushel, and the largest for a bushel of seed. Price 50 cents, $1 and $2 respectively. Sent by mail or express on receipt of price.
Agents wanted. Send for Circulars containing testimonials. Address WAUGAMAN & CO.,
Care GEO. BINGHAM, Adams Express,
PITTSBURGH, PA.

HELP!
FOR THE WEAK,
NERVOUS AND
DEBILITATED!
The afflicted can now be restored to perfect health and bodily energy, at home, without the use of medicine of any kind.
PULVERMACHER'S
ELECTRIC BELTS
AND BANDS,
For self-application to any part of the body, meet every requirement.
The most learned physicians and scientific men of Europe and this country indorse them.
These noted Curative appliances have now stood the test for upward of thirty years, and are protected by Letters-Patent in all the principal countries of the world. They were decreed the only Award of Merit for Electric Appliances at the great World's Exhibitions—Paris, Philadelphia, and elsewhere—and have been found the most valuable, safe, simple, and efficient known treatment for the cure of disease.
READER, ARE YOU AFFLICTED?
and wish to recover the same degree of health, strength, and energy as experienced in former years? Do any of the following symptoms or class of symptoms meet your diseased condition? Are you suffering from ill-health in any of its many and multifarious forms, consequent upon a lingering, nervous, chronic or functional disease? Do you feel nervous, debilitated, fretful, timid, and lack the power of will and action? Are you subject to loss of memory, have spells of fainting, fullness of blood in the head, feel listless, moping, unfit for business or pleasure, and subject to fits of melancholy? Are your kidneys, stomach, or blood, in a disordered condition? Do you suffer from rheumatism, neuralgia or aches and pains? Have you been indiscreet in early years and find yourself harassed with a multitude of gloomy symptoms? Are you timid, nervous, and forgetful, and your mind continually dwelling on the subject? Have you lost confidence in yourself and energy for business pursuits? Are you subject to any of the following symptoms: Restless nights, broken sleep, nightmare, dreams, palpitation of the heart, bashfulness, confusion of ideas, aversion to society, dizziness in the head, dimness of sight, pimples and blotches on the face and back, and other despondent symptoms? Thousands of young men, the middle-aged, and even the old, suffer from nervous and physical debility. Thousands of females, too, are broken down in health and spirits from disorders peculiar to their sex, and who, from false modesty or neglect prolong their sufferings. Why, then, further neglect a subject so productive of health and happiness when there is at hand a means of restoration?
PULVERMACHER'S
ELECTRIC BELTS AND BANDS
cure these various diseased conditions, after all other means fail, and we offer the most convincing testimony direct from the afflicted themselves, who have been restored to
HEALTH, STRENGTH, AND ENERGY,
after drugging in vain for months and years.
Send now for DESCRIPTIVE PAMPHLET and THE ELECTRIC QUARTERLY, a large Illustrated Journal, containing full particulars and INFORMATION WORTH THOUSANDS. Copies mailed free. Address,
PULVERMACHER GALVANIC CO.,
Cor. Eighth and Vine Sts., CINCINNATI, O.
☞ *Avoid bogus appliances claiming electric qualities. Our Pamphlet explains how to distinguish the genuine from the spurious.*

Patented May 28th, 1878.

The Patent Self-Acting Cow Milker M'f'g Co.
Every one who owns a cow should have one of our wonderful Milkers. Sent free to any part of the United States on receipt of $2. Send for our Illustrated Pamphlet on the Cow, containing sectional views of a cow's teats and bag dissected and scientifically explained, by Drs. White and Wilson of this city. Sent free to any address.
GEO. E. KING, President,
Office, 575 Broadway, New York.

Reading for the Young.

A POCKET-MONEY SUGGESTION.

THE inventor affirms that the artist has grasped his idea. We don't know what the artist thinks about it. He has not been seen in the editorial rooms since leaving the drawing. The inventor, however, claims for his invention: (1) amusement; (2) a quickly-selling article, and (3) æsthetic loveliness.

These figures may be said to be the fruit of the imagination, as the graceful forms owe their charm to raisins, dried apples, peaches, nuts, etc. The dorsal fin of those "queer fish" is made of a wire, and any boy or girl with an ounce of ingenuity can construct the figures. Their grotesque

appearance creates a market, and they can be made and sold at a price to pay for trouble of making, with a handsome profit added.

The inventor is a humane creature, with a great love for children and an abhorrence of wealth. Consequently he gives his idea to the RURAL cousins without price, reserving no right, and claiming nothing except their everlasting gratitude. He expects every household in the land to be adorned with this "object of bigotry and virtue," as Mrs. Malaprop would say, and as its manufacture will make an unusual demand on dried fruits, he will invest largely, control the market, and sell at an advance,—but he does not care to make anything, the toy is free!

We should like to hear who sells the greatest number of the little fruit men and women, and what is realized in pocket-money.

HOW POOR READERS ARE MANUFACTURED.

MAY MAPLE.

"Why are there so many poor readers?" is a question often asked. And yet but few, comparatively speaking, are able to give a satisfactory answer. But it is not, in my humble opinion, a difficult question to solve, though poor readers will long continue to weary the souls of their listeners before the nuisance will be banished. Of course, one's natural predilection has somewhat to do with good or bad reading.

But the fault lies principally in our common-school system. The constant changing of teachers every three, four or five months is enough to spoil the best natural reader in existence, even though each instructor was a clever elocutionist. Not one in five can lay claim to the merit.

One term brings a teacher with a strong nasal twang, and the next, one with a deep gutteral intonation. Another has the down-east Yankee drawl, uniting as many vowels in one syllable as possible; as, meauntain. This one runs vowels, consonants, syllables and words into one indistinguishable mass, without pauses or paragraphs, and his successor "clips" the words so much that one loses the meaning of the author—in trying to fill out the words with the proper sounds.

A clear and distinct articulation is entirely out of the programme when the instructor has neglected to cultivate his own voice, no matter how well he may drill his class in the rules of elocution. The child will imitate the tones he daily hears rather than follow any printed directions. All too soon, one hears the lisping, stammering teacher in the speech of the pupil. Such instructors do more harm to rising generations than can well be estimated.

Again the Jimmies and Harrys, Jennies and Matties are sent to school when five years of age. They are bright-eyed, rosy-cheeked, warm-hearted little home treasures; they have various capabilities, and if properly trained each would, in all probability, make a noble specimen of scholarship, and a good reader, if not the very best.

Miss A. has just entered the profession of teaching. She is anxious to please her patrons and to win a reputation as a successful instructor. She is pleased with the efforts of her pupils, and determines to push them forward in their studies, or rather in their books. The little ones are taught to know the *most* of the letters at sight, and are then put into sentences. Probably one out of six or eight in the class can master each simple sentence readily, and is thus able to make rapid advancement. The rest of the class are pushed along, taking the same lesson with this one (who chances, perhaps, to be exceptionally clever), stumbling and blundering, like people walking unfrequented paths in the night. Less and less do they understand of what they are trying to learn, as they rapidly approach the closing pages of the primer. The prodigy of the class has an aptitude for books that none of her mates possesses. She clings to her book as the bee to the honey-filled flower. It is seldom out of her hand, and never out of her mind. Of course, she makes rapid progress, and when she reads the last page, is ready, as far at least as pronouncing the words is concerned, to go into a higher book. But it will never do to "pass" that child above the rest of her class. There would be an appearance of injustice, and Miss A.'s patrons would have occasion to be offended. Her reputation as a successful teacher would be called in question, and that thought is not to be endured for a moment. So she sings the praises of her pupils, remarks upon their large capabilities and powers of learning easily; and when the little Mary has "her book by heart," new books for the whole class are ordered. The parents, thoughtlessly placing perfect confidence in the judgment of the teacher, get the required article without ever testing the ability of the children in the old book. And those pupils who cannot pronounce, at sight, the words of the most simple sentences in the primer, or even spell and pronounce the words, are put into the First Reader.

At the close of the term the children "speak their pieces," receive their rewards of merit from the teacher, and go home for vacation. The books are put upon the shelf, there to remain till the next term commences, two or three months later. Miss A. also receives her reward, financially, and goes her way.

Miss B., her successor, hears how rapidly the pupils, now under her (Miss B.'s) charge, learned at the last term, and determines not to be outdone; and so this little class of bright scholars are sent forward, but downward into the abyss of seeming stupidity, by having a Second and a Third Reader put into their hands all too soon.

If by chance Miss C. or Miss D. should have thoughtfulness and experience enough to see the utter folly of such proceedings, and so suggest the idea of returning the majority of the class to the Primer, she would at once be in disgrace with two-thirds of her patrons. Their children were just as smart and could learn "just as well as neighbor B.'s girl. No! they must read in the new books."

Alas! for them; their doom is sealed, as far as good reading is concerned. Six out of seven will go through life unable to read a single paragraph in a really intelligible manner. Amid so many difficulties, and with so little really good training, we do not wonder why there are so few superior readers, but are almost surprised that there are so many who render an article passably well.

Sabbath Reading.

OF THE MISCHIEF AND DANGER OF EXAGGERATIONS IN RELIGION.

E. M. G.

LORD BACON somewhere compares religion to the sun, which has two contrary effects upon live and dead substances. Live animal substances,—the living body of man, for example,—the sun invigorates, and cheers, and promotes the functions of life in them. But in dead animal substances the sun breeds worms, and turns them to corruption. Similarly, he says, religion invigorates a sound mind, and cheers a sound heart, while in a morbid mind it breeds noisome superstitions, and miserable scruples, and grotesque, and even monstrous fancies; the fault however not being in religion, but in the diseased mind, which is subjected to its influences. Such is the thought of the great philosopher, if these are not the very words in which he has expressed it.

We have only to survey the history of Christianity, to see how eminently just this comparison is. The Gospel, as taught by Our Lord and His Apostles, is holy, pure, divine, transparently clear, radiant alike with the glory of God and the happiness of man—of that there is no doubt; yet what twists has the mind of man contrived to give it, so that in some forms of Christianity you can hardly at all recognize the original draught, as it came from the Divine mind! What follies, fancies, superstitions, licentious doctrines, have founded themselves—not justly, of course, but with a most perverse ingenuity—upon the Scriptures of the Old and New Testament!

This has arisen, not from any fault or shortcoming in the Scriptures themselves (God forbid! His Word is, like Himself, perfect), but from a certain morbid tendency in the human mind to caricature truths presented to it. I believe we cannot express the tendency in question more exactly than by calling it a tendency to caricature. A caricature is the likeness of a person, in which the artist has caught some of the leading points of the countenance, but has so unduly exaggerated them as to make the whole likeness absurd and grotesque. There is always a point of resemblance in a caricature, or persons would not know for whom it was meant; but the point is excessively magnified and thrown out of all proportion to the other lineaments, or people would take it seriously, and it would cease to be a caricature, and become a portrait. Now it would be very interesting to consider every heresy which has hitherto arisen, and see how in each case it has been a caricature of some one point of Christian Truth,—an exaggeration by which the fair proportion of the Faith (of which St. Paul speaks in the Epistle to the Romans) has been distorted, and a single passage of Scripture or a single class of passages brought into undue prominence.

We will take one or more instances from those heresies which are better known. The truth upon which the Quaker founds his whole system, is that the New Dispensation is spiritual. No truth can well be more vital, more important, or more apt, through the subtle encroachments of formalism (a sin which is at all times waylaying us), to be dropt out of sight. It is quite necessary for all of us to turn round every now and then, and ask ourselves whether we are properly awake to it. That the law, under which Christians live, is the law, not of a written table, nor of a written book, but "the law of the Spirit of life in Christ Jesus," written on the fleshy table of the heart; that in place of a code prescribing or forbidding *actions*, our Legislator has given us a code of Beatitudes on certain states of heart and feeling; that in the Gospel morality what we do goes for comparatively little, and what we are—our motives and intentions—for every thing; that each movement of the heart is judged by Him who reads the heart; that God is a Spirit, and therefore to be worshiped in spirit and in truth, and that, accordingly, to approach Him with outward ceremonial, exclusive of the heart, is as much an impossibility in the nature of things, as to endow matter with the properties of mind, and make a stone work a mathematical problem; all this is not only true, but precious truth, of which we require to be reminded continually: and the Quakers would have deserved the warmest thanks of Christendom, if they had done nothing more than brought it forward prominently, and illustrated it strikingly. But, unhappily, having seized this one feature of the Truth as it is in Jesus, they caricatured it.

They proceeded on the theory of a spiritual dispensation to such an absurd extent, as to rob the Church of her Sacraments, the repositories and vehicles of that very inward spiritual grace, of which the Quakers themselves were the stoutest maintainers. "If religion is spiritual," they argued, "we must have nothing material about it; so, notwithstanding the Lord's words, 'Go ye, baptizing all nations,' and "Do this in remembrance of Me," we will banish from our meetings the water, the bread and the wine, and be baptized and communicate in the spirit only."

It has always been the opinion of pious and judicious divines in the Church, that because, even in the Sacraments, the inward spiritual grace is the chief matter, Christians shut out from communicating sacramentally (by illness or other necessity) may do so spiritually in their closets by uniting their prayers and intercessions with those which are passing in the Church; but the actual renunciation of the outward visible sign, as the Quakers have renounced it, would never have entered into the head of any one, unless his mind had been possessed with some one idea, and he had resolved to make the idea stand for the whole of Christianity.

We offer another and more recent instance of a very serious error, which we fear is fast assuming the proportions of a heresy. It is the delightful announcement of Holy Scripture—which should make every heart bound with joy,—and it may be said to be the very most fundamental truth of our religion, that "God is Love." His Love He has shown by a Sacrifice which must surely have wrung to the utmost His paternal heart, if a similar sacrifice would have proved to a mere human parent the most acutely painful of all trials,—the sacrifice of His dear Son, Who from all eternity had lain in His bosom. Certain divines of our own day have perceived this truth of God's Love clearly. They cannot proclaim it too loudly,—not if they had a hundred tongues, and the lungs of a Stentor. Down with all teaching, which by real logical inference contradicts this fundamental truth;—it must be false, unscriptural, mischievous.

That our God is a hard taskmaster, requiring of us services, which will not ultimately make for our own happiness; that austerities, as austerities, without any spiritual end, are pleasing to Him and propitiate his wrath (a notion utterly and simply heathen); that only the Second Person of the Blessed Trinity smiles upon us with a gracious welcome, and that the brow of the First is always contracted with a gloomy frown towards sinners:—let these sentiments by all means be demolished with axe and hammer, because they contradict God's own testimony respecting Himself. But to go the length of saying that anger is inconsistent with love, (an assertion which the analogy of parental affection surely enables us flatly to contradict,) or to go the further length of saying that justice is inconsistent with compassion, against all experience of human justice; (for ever what offender led out to execution, does not the heart of man relent at the last moment, while yet feeling the justice and necessity of the proceeding?) and to acknowledge no relations with God as a Judge, because He stands to us in the relation of a Father, this is a monstrous exaggeration, whereby the Faith once given to the saints is grievously caricatured, and its fair proportions marred. God loves me deeply, purely, intensely; longs to communicate himself to me;—that is indisputably true, and I may take to myself all the comfort of it without a moment's hesitation. But God hates my sin, detests it, brought Christ to a strict reckoning for it, and will never consent to save me from its guilt without saving me from the power of it too:—that is equally true, and I may take to myself all the warning of it, without a moment's hesitation.

These two instances are enough to show that very serious errors and heresies spring from not maintaining what St. Paul calls "the proportion of the faith,"—that is from giving to any one doctrine, however true and important, so great a prominence that it throws into the shade all others which counterbalance it.

And be it remembered that, where there is no formal or actual heresy, the one-sided tendency of the human mind is nevertheless operative in religious persons, and may lead to a vast amount of unsuspected mischief and error, which shall corrupt their religion, and breed in it many morbid and fanatical fancies. In many spiritual books, which in the main are excellent,—perhaps I may say in every spiritual book, more or less, which is not the Bible,—a strain is upon certain precepts of the Gospel, which not only caricatures them, and perhaps sets them at issue with other precepts resting on the same authority, but would have the effect of cramping into an unnatural state the mind which should strive after obedience to them. As nothing illustrates with the same effect as an example, I will give one; and, the better to exhibit the principle, it shall be in an extreme form. A Christian, who had attained a high degree of sanctity, and who died in the most acute suffering, which he bore with exemplary patience, gasped out to the spiritual adviser who attended him, the following words: "Dear friend, God has taught me a great secret, and I will tell it you, if you will put your head closer." His friend did as he desired, anxious to know what this saintly man considered as the crowning lesson of a life of holiness. "He has taught me," said the dying man, the lines of whose countenance were distorted by pain, "to ask nothing, and to refuse nothing."

Where has He forbidden us, under suffering, to cry for relief? Did Our Lord, or did He not, pray, "Father, if it be possible, let this cup pass from me?" If He did, God evidently had not taught His only-begotten Son to "ask for nothing." And His Son's Humanity was spotless in holiness,—He was clearly "void of sin, both in His flesh and in His spirit." Shall we, miserable sinners, presume with a frightful temerity to go further in conformity to the will of God than Jesus Himself went? Forbid it, Lord! We will go to Thee in our troubles with all simplicity, and make known to Thee our request for relief, in submission always to Thy Will; and having preferred our request, we will leave it there in our Father's hands, and account that we have thenceforth nothing more to do with it. But find a vent towards God for our burdened heart we will, because He Himself has opened such a vent when He says: "Ye people, pour out your hearts before Him."

Do you not see now how this holy man erred by exaggeration; how in his dying sentiment he caricatured the grace of resignation? Resignation no doubt is a heavenly and Christ-like grace; but if you will push it to any and every length, regardless of other precepts of God's Word, and even regardless of common sense, (a very valuable aid in religion), even resignation might become absolutely mischievous. Thus in countries where the weather is sultry, and the people constitutionally indolent, one might conceive a beggar continuing in mendicancy, and doing nothing to raise himself above it, or to improve his condition, on the plea that such was the Will of God, and that mendicancy was the state of life to which he had been called. Resignation is the only precept which such an one recognizes; and he has forgotten that in another corner of God's Word, there is a certain maxim, less chivalrous perhaps than resignation, but equally deserving his attention,—that "any man that would not work, neither should he eat." This, of course, is another extreme case. I only adduce it, because it illustrates the fault which we are at present exposing and censuring.

Be it remembered, in pursuing the train of thought which we have thus opened up, that in the lives of the early *Spiritual* saints, who, next to Our Blessed Lord, are our great models, nothing is so remarkable as their perfect naturalness, and freedom from all affected or overstrained spirituality. The great Apostle of the Gentiles, whose name and fame are in all the Churches, immediately after a miraculous escape from shipwreck, bestirs himself to gather a bundle of sticks, and puts them on the fire (for St. Paul was not above feeling cold and wet); and when writing under the afflatus of the Holy Ghost, he bids Timothy bring the cloak which he left at Troas with Carpus, in anticipation of an approaching winter, "and the books, but especially the parchments;" for what studious man—and every minister of Christ must be studious, if his ministry is to be effective—can bear to be without his books and papers? These particulars have seemed to some too frivolous for Inspiration, but they show that Inspiration did not destroy the perfect simplicity and naturalness of those who were the subjects of it.

Among the early disciples you would have seen nothing overcharged in character or manner; nay, you would have seen little foibles, (not that these are to be imitated,) of temper, of superstition, of prejudice;—you might have heard sharp words passing between great Apostles, and a rupture taking place in consequence; you might have heard even St. Peter roundly and publicly reproved for clinging to a prejudice; and you might have seen a damsel, recently engaged with others in prayer which received a miraculous answer, in such a joyful trepidation of nerves when the answer arrived, that she opened not the gate for gladness, but ran in and told "how Peter stood before the gate." Most of us would thankfully acquiesce in being as saintly as the primitive Christians; and surely it is a lesson for us that there is in their sanctity so little over-studied so little walking on stilts, so little of the forced unnatural attitude, into which modern books of devotion sometimes try to cramp the mind. In ancient piety there was not a particle of asceticism or of Puritanism,—which two things I mention together, because they are the Roman and Protestant sides of the same fault

How, then shall the devout man keep his mind free from exaggeration both in doctrine and practice; and hold in check its natural one-sidedness? An impartial study of the whole of Scripture is the corrective. Read with real openness of mind, quite willing to renounce any such preconceived views as do not square with the great Canon of Truth. Of set purpose study, and give their fair weight to, those doctrines or practices, to which your mind is not naturally drawn. Pray for the Bereans' nobleness of the mind, in that they brought even the doctrine of Apostles to the test of Inspiration, and searched the Scriptures daily, whether these things were so. How much more, when men are not Apostles, but simply possessors of the mind of Christ, must their doctrine be thus searched and sifted! Much irreverent nonsense has been talked of late about a verifying faculty, but, (God be praised!) we have some more certain criterion of Truth in a verifying Book. It is true that there is no error whatever, which may not be bolstered up by an appeal to some part of the Holy Scriptures. Atheism itself, it has been well said, may be proved from the Bible, by leaving out the words, "The fool hath said in his heart." But when applied impartially, without favor or prejudice, and in full view of the passages on the other side, Holy Scripture is a thoroughly safe and sound criterion. Do not merely read it, but imbue your minds with it. Do not merely quote it, (a very easy and somewhat poor attainment,) but frame your religious sentiments upon it, and then you shall bear a charmed life against error, and heresy, and all manner of morbid fancies and fanaticisms.

PERSONAL ITEMS.

President MacMahon's official salary is $200,000 a year; that of Louis Napoleon was $6,000,000.

Mr. Charles Reade is a tall, slender, fine-looking man, with gray hair and moustache, a broad forehead, and a peculiar dilating blue eye.

Secretary Evarts has gone to his country seat at Windsor, Vermont. He will be absent from Washington during the month of August.

Mrs. Mary A. Livermore is a thrifty woman. It is said that she realizes $18,000 a year from her lectures, which are all prepared with the greatest care.

Mr. Layard, British Minister at Constantinople, has become Sir Henry Layard, G. C. B. He is of Hugenot descent, and first was known to fame by discovering the Ninevah bulls. His intimacy with the East dates as far back as 1839, when he was only 22.

There is no truth in the statement that has lately been going tho rounds, to the effect that Jenny Lind is poor. She is worth at least $2,000,000, half of which was made in America. Her husband, Mr. Goldschmidt, invested it so successfully that it has largely increased.

The richest heiress in America is said to be Miss Celeste Winans, daughter of the late Mr. Thomas Winans, of Baltimore. The young lady is but twenty years of age, and is, as she was before she received the fortune of $20,000,000 inherited from her father, a very handsome girl.

Dr. Helmbold, of buchu fame, has just failed in an effort to supersede the commission in lunacy, which for some time has directed his affairs. The Philadelphia court, before which the application was made, in denying the petition, decides that Helmbold is a lunatic with lucid intervals.

Physicians to the Emperor William ascribe his Majesty's relatively slow progress towards recovery to the great loss of blood and appetite, to the shock to his system and to mental depression. His power of locomotion is small. His hands are helpless and he can only eat with assistance.

It is said of Prince Bismarck that in his youth he never parted with a manuscript without carefully revising it; and once, when rallied on his caution, rejoined: "It is no credit to be right where it would be inexcusable to be wrong." Would that all would carefully revise their manuscripts, before puzzling or exasperating others with them!

There is a kinship in royalty which blossoms out on occasions of grief. Queen Victoria's telegram of condolence to the King of Spain on the death of his young wife, was as follows:—"Dear Brother, my heart bleeds for you. What an awful misfortune it has pleased God to send you! May He give you strength to bear this terrible loss."

Mr. Bryant was probably the wealthiest poet this country has produced, and, with perhaps the exceptions of Samuel Rogers and Lord Byron, the wealthiest, or among the wealthiest, of the Old World. His estate is said to be worth $500,00. Newspaper writing, and still more judicious investment, however, added much more to his riches than ever his poetry did.

The town of Elton, Durham County, England, puts in a claim to having the oldest woman in the world as one of its citizens. Her name is Mary Benton, and though alleged to have been born February 12, 1731, and therefore to be in her 148th year, still she is in possession of all her faculties, perfect memory, hearing and eyesight. She cooks, washes and irons, threads her own needle and sews without spectacles.

A Paris letter-writer says that no American lady leads so brilliant a life as Madame Waddington, the wife of the French Minister of Foreign Affairs. A strange combination of nationalities this family presents. He is of naturalized British parents, was educated under Arnold at Rugby, and rowed in the Trinity eight at Cambridge. His wife is daughter of the late President King, of Columbia College, this city.

The first introduction of John B. Gough to the people of Worcester, Mass., among whom for many years he has made his home, was in 1840, when he visited that city with a diorama of the Battle of Bunker Hill. His business in connection with the show was to turn a crank that set the figures in motion, and to sing songs in the praises of the exhibition. He disliked the life, for while he made others laugh he was very sad himself, and soon received work from a kind-hearted book-binder there.

While few English Prime Ministers have been very rich, some have been conspicuously impecunious. Pitt never married, and declared that he couldn't afford it, and Canning and Disraeli were bolstered up by wealthy wives. The late Lord Derby and Sir Robert Peel are the only instances of very wealthy Prime Ministers, though Lord Melbourne was very well off. Lord Palmerston only become so, late in life, through a rise in mineral property. His wife, too, succeeded to her brother Lord Melbourne's estates.

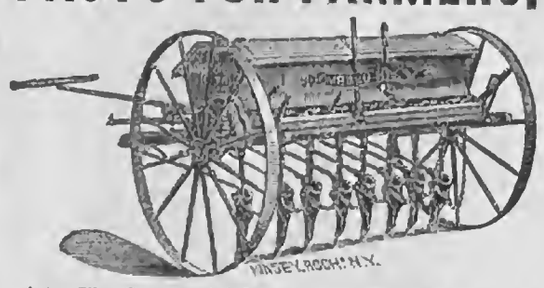
It is a mistake to suppose that any department of a paper may be slighted. The most important information is to be found, at times, under the guise of an advertisement; and it is agreeable to the advertiser and a courtesy to the publisher to mention the source of your information—in other words, to mention the paper.

Implements and Machinery.

FACTS FOR FARMERS.



1st.—The Centennial Commission MADE BUT FIVE AWARDS to Grain Drills and Fertilizer Attachments.
2d.—Of these five, TWO were given Bickford & Huffman. One on the FARMER'S FAVORITE and one on Fertilizer Attachment.
3d.—NO OTHER MANUFACTURERS RECEIVED AN AWARD ON A FERTILIZER ATTACHMENT!
4th.—The award to the "Champion," built by Johnson, Gere and Truman, was "for a machine with attachable manure distributor;" an implement they did *not* exhibit and *do not offer for sale*, as their "manure distributer" is neither "attachable" nor detachable. The report does *not* commend this drill or its "manure distributer," for a single quality of work.
5th.—The award to the Farmer's Friend pronounces it defective by saying *it is capable of further improvement, as regards delivery up and down hill;* and also to the McSherry drill in these words: "*Some further adjustment appears desirable to enable this drill to deliver with equal quality up and down hill.*"
6th.—The Empire, Buckeye Hoosier, Superior and Hagerstown drills were *refused* EITHER AWARD OR REPORT, because of great "irregularities" or "variations" in the tests.
7th.—The variation of our nearest competitor. The Champion, *from its own distribution*, was MORE THAN 237 PER CENT. of that shown by the FARMER'S FAVORITE.
8th.—The award to the FARMER'S FAVORITE, distinguished it by commending it for "ACCURACY OF DELIVERY, AND REGULARITY OF DISCHARGE UNDER DIFFERENT CONDITIONS," and "REGULARITY OF DELIVERY UNDER ALL CONDITIONS." Qualities conspicuously lacking in its competitors.
We challenge contradiction of a single feature of the above statements.
Fully 80 per cent. of all the Fertilizer drills in use on the American Continent are built under our patents,—a fact that tersely and undisputably establishes superiority. For circulars, prices or information see our agents, or address **Bickford & Huffman, Macedon, N. Y.**

New Publications.

TO ADVERTISERS! We will send free to all applicants who do any newspaper advertising, the THIRD EDITION of
AYER & SON'S MANUAL
FOR ADVERTISERS. 160 8vo. pp. More complete than any which have preceded it. Gives the names, circulation, and advertising rates of several thousand newspapers in the United States and Canada, and contains more information of value to an advertiser than can be found in any other publication. All lists have been carefully revised, and where practicable prices have been reduced. The special offers are numerous and unusually advantageous. Be sure to send for it before spending any money in newspaper advertising. Address N. W. AYER & SON, ADVERTISING AGENTS, Times Building, Philadelphia.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper,* and in Premiums to Agents.

Wit and Humor.

WHEN is a pie like a poet?—When it's Browning.

MADE of awl work—Shoes.—*Boston Commercial.*

WEDDING belles—those who have a wedding ring.

WORKINGMEN'S demagogues—The idle of the people.

CAT-EGORICAL statement—Speaking to the purr puss.

WHAT kind of ship has two mates and no captain?—A Courtship.

WHY is a rose-bud like a promissory note? It matures by falling dew.

WHAT man must have his glass before he can do a day's work?—A glazier.

WHAT kind of lights did they use in the anent synagogues? Israelites.

THE girls of Tuscola, Ill., place a blue ribbon and a mitten on the table when their lovers come to visit them, and say, "Choose."

EARLY to bed and early to rise makes a man healthy, wealthy, and wise; but early to ryes and tardy to bed makes a man's nose turn cardinal red.

AN enthusiastic Indiana editor wrote, "The battle is now opened;" but, alas! the intelligent compositor spelt battle with an "o," and his readers say they have suspected it all along.

AH! well, my dear fellow, marriage is the best thing in the long run, and I can assure you that after a year or two a man gets used to it, and feels just as jolly as if he had never married at all.

How funny! If you see a merchant studying up the sailing days of foreign steamers, you form a high opinion of his business; but if a cashier does it, you draw your deposit from his bank instanter.—*Lowell Courier.*

THE Compte de L——, says *Figaro,* married not long since an African negress from the Congo district, whose head is adorned with a fine growth of wool. Her French maid, when the Countess is engaged at her toilet, now announces, "Madame is carding herself."

A WITTY clergyman, accosted by an old acquaintance by the name of Cobb, replied: "I don't know you, sir." "My name is Cobb, sir," rejoined the man, who was about half seas over. "Ah, sir," said the minister, "you have so much corn on that I did not see the cob."

HE had brought her the very things she wanted from the supper table to her safe retreat on the stairs, and she was moved to say, half langhingly, "You are a man after my own heart, Mr. B——." "Just what I am after," he answered, quick as a flash, covering her with confusion

"SOUND," said the schoolmaster, "is what you hear. For instance, you cannot feel a sound." 'Oh, yes, you can," said a smart boy. "John Wilson," retorted the pedagogue, "how do you make that out? What sound can you feel?" "A sonud thrashing," quickly replied the smart boy.—*New York Tribune.*

A DOCTOR, while escorting a lady home one evening, offered her a troche to relieve her cough. He told her to allow it to dissolve gradually in her mouth. No relief was experienced, and the doctor felt quite chagrined the next day when the lady sent him a pantaloon button with a note, saying he must have given her the wrong kind of a troche, and might need this one.

A LECTURER on natural history was called upon the other day to pay for a live rabbit which he had in a basket in a railway car, and which the conductor said would be charged the same as a dog. The lecturer vainly explained that he was going to use the rabbit in illustration of a lecture he was about to give in another town, and, indignantly taking a small live tortoise from his pocket, said, "you'll be telling me next that this is a dog, and that I must pay for it also." The conductor went for superior orders, and, on his return delivered this lecture on natural history: "Cats is dogs, rabbits is dogs, but a tortus is a hinsect." The professor had to pay dog fare for the rabbit.

Milestones on the Road to Health.

THE recovery of digestion and the resumption of activity by the liver, bowels and kidneys are milestones which mark our progress on the road to health. They speedily become perceptible when Hostetter's Stomach Bitters is used by the invalid. Nothing so surely and expeditiously consumes the distance to the desired goal. As no bodily function can suffer interruption without impairing the general health of the system, so the system can never acquire perfect vigor, health's synonymn, until that function be actively resumed. Take, for instance, digestion, a suspension of what is invariably rectified by the Bitters. If the organs upon which it devolves grow weak, billiousness, constipation, headache, poverty of the blood, and a hundred other symptoms supervene, which indicate unmistakably the baneful general influence of dyspepsia. The disappearance of all these symptoms through the use of the Bitters shows with what thoroughness it removes their cause.

TEMPERAMENTS.—No. 4. Melancholic.

The Naturalist.

THE PORCUPINE.

The small family of porcupines is divided by naturalists into four genera—the Porcupines proper; the Prehensible Porcupines; the Aulacodes, and the Mexican Porcupines; and of the first genus there are several species, named either from some peculiarity in their conformation or from their habitat.

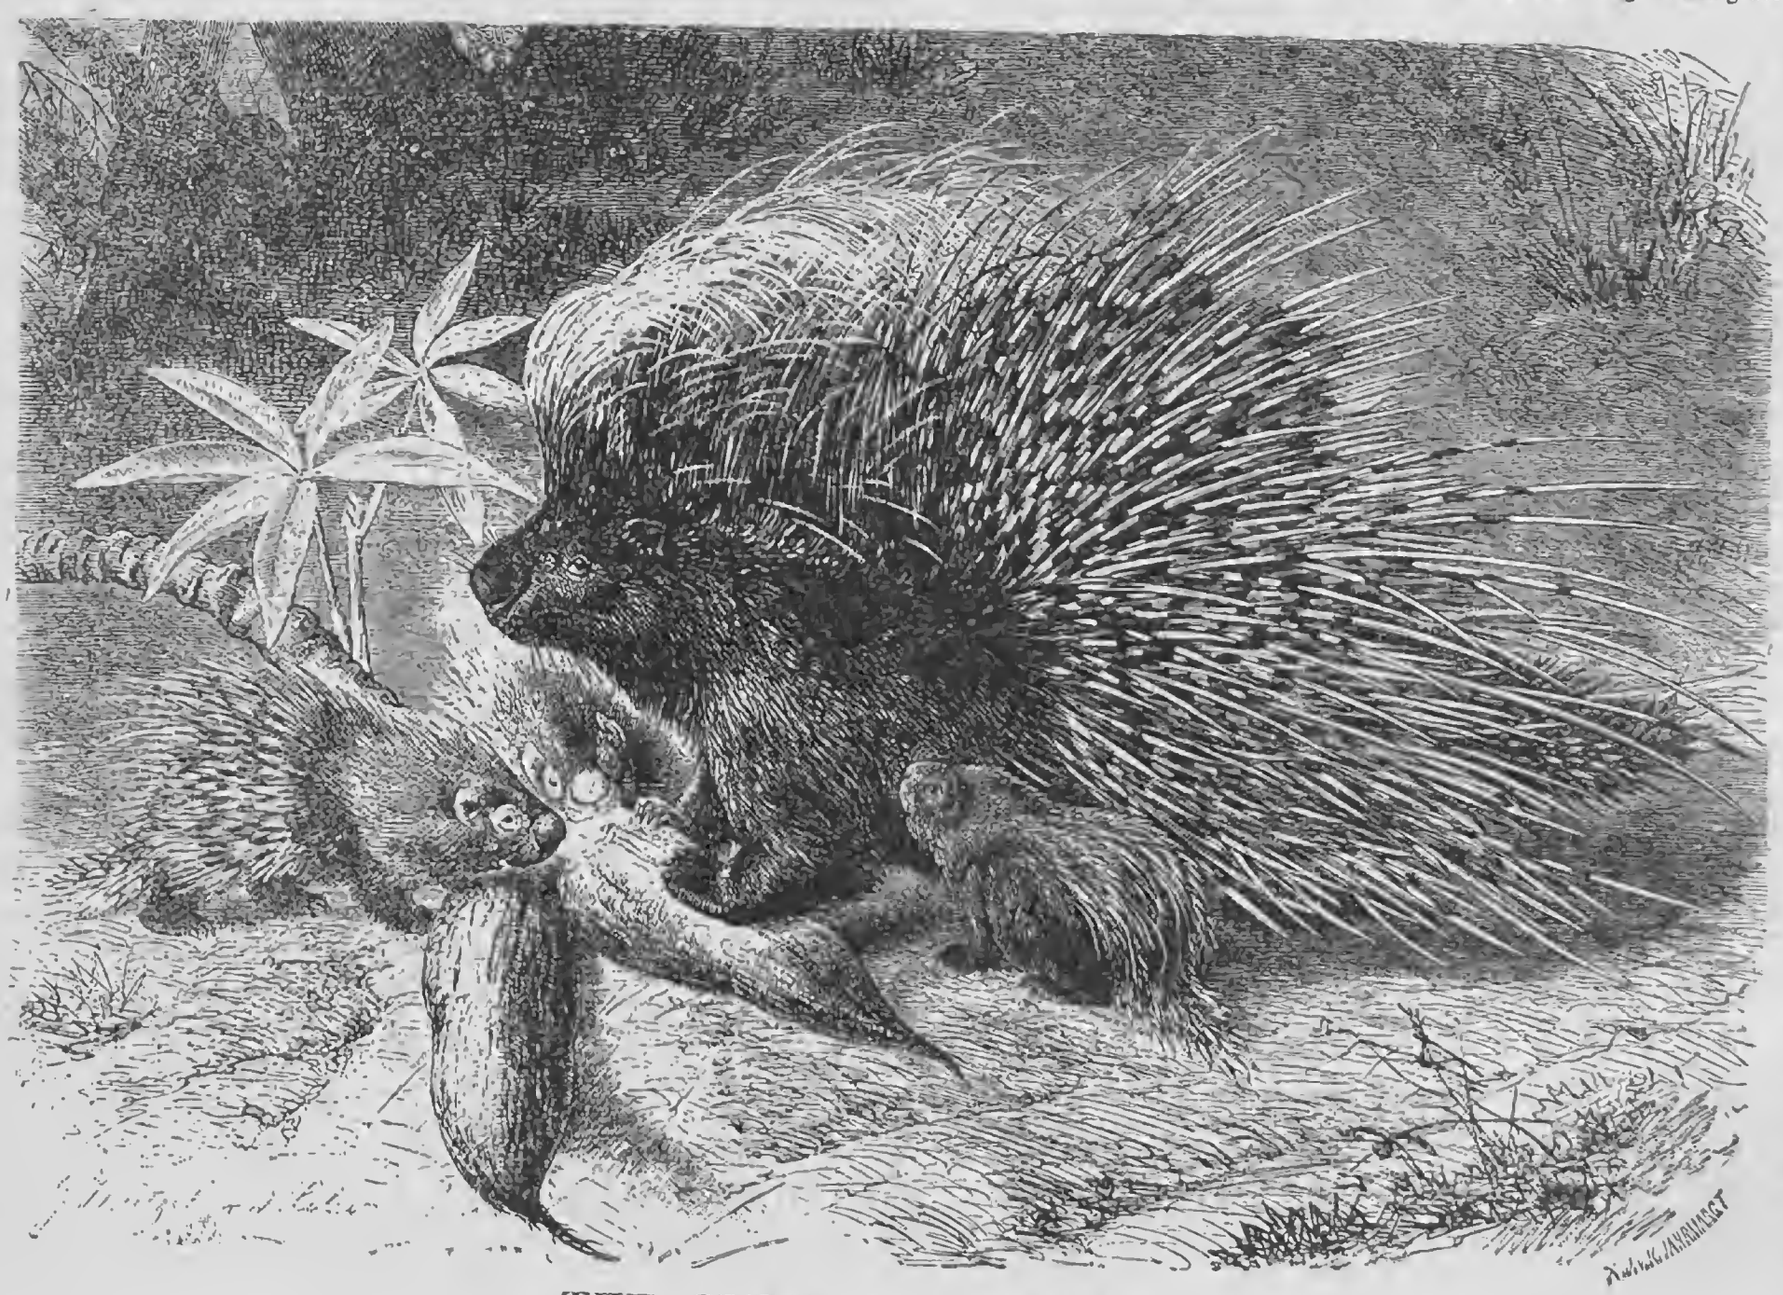
Of these the most widely diffused is the Crested Porcupine which is found in Italy, Greece and Spain, in Europe, as well as in Northern Africa and in many parts of Asia, especially in Hindoostan. It is the largest of the Rodents, its total length being about three feet six inches, and from this fact together with its wide dispersion, and marked characteristics, it deserves to be considered the legitimate representative of the whole genus. The spines or quills of the porcupine, the possession of which has won for the animal a widespread celebrity through the ages, under ordinary circumstances lie close down on its body; and one seeing them in this position would hardly suppose that at a moment's notice they could be transformed into formidable weapons of offense or defense. But let anger or fear seize upon the animal, and instantly a whole forest of bayonets bristles up on all sides. These vary considerably in length from five to twelve inches, the longest being flexible and incapable therefore of inflicting much injury on an opponent. Beneath these, however, is an abundant supply of shorter spines which are the really dangerous weapons in this bristling armory. Among the myths of former days was a generally believed story that the porcupine could hurl its pointed spears at an enemy with fatal precision, but although recent investigation has shown this report to be fabulous, yet these sharp quills are weapons not to be despised by any animal that may venture to attack their possessor.

Their hold on the skin is very slight, so that when struck into a foe they remain fixed in the wound, and, unless immediately removed, work sad misery to the sufferer. For the barbed quill is so constructed that it gradually bores its way into the flesh, burrowing deeper at every movement, and not unfrequently causing death even to so powerful a beast as the leopard or tiger. Conscious of its power, the porcupine is not an aggressive animal, and seldom if ever makes an unprovoked attack. If irritated or wounded, its bristles are spread widely abroad, and with its head between its fore-paws, at the same time uttering a hollow grunting noise, it rapidly backs against its assailant. There are few animals that have once come in contact with the spears of the fretful porcupine, willing to face them a second time, and even the preliminary rustle of the hollow tail quills, with which the creature generally prepares for each attack, is quite sufficient to make most animals flee in terror.

The porcupine is shy, solitary and nocturnal in its habits, seldom venturing before sunset from the deep burrow which it excavates with many entrances, in some unfrequented spot. Its food, which it seeks at night, is entirely of a vegetable nature, consisting of herbs, bark, fruit and roots. In winter it undergoes a partial hibernation. The female brings forth once a year three or four young which from their birth are covered with quills. It is said not to require water, as its thirst is amply satisfied by eating succulent fruit and roots. Its incisor teeth are so strong as to easily cut through the hardest wood as if it were butter; while its nose is so tender that the animal is instantly stunned by a slight blow on that organ. Its spines are encircled with alternate rings of black and white, producing a fine contrast of color. The muzzle is furnished with long and strong whiskers; the head and neck are crested with long stiff hairs which can be erected or depressed at pleasure. Its gait is slow, clumsy and plantigrade, and as it walks, its quills shake and rattle, while if suddenly surprised it coils itself up in a ball, like a hedgehog, and presents an array of threatening spikes which renders it safe from the attacks of all animals except man. Its flesh is not unpalatable, resembling pork somewhat in flavor; and it is doubtless this similarity, together with its grunting, to which it owes its name of Porcupine.

The best known member of the genus, however, in the northern part of this continent, is the Urson, Chawquaw, or Canadian Porcupine. This is a native of North America, where it is a destructive enemy of the trees among which alone it is found. It is seldom met with south of the 46 parallel; but north of that line it is a frequent inhabitant of pine woods whose living bark forms its principal food. Its custom is to ascend to the top of a tree, commence at the highest branches and eat its way downwards. Having peeled one tree, it takes to another, and then to a third, always selecting those that run in a line; so that its path through the woods may be readily traced by the row of barked and dying trees it leaves behind it. A single Urson has been known to destroy a hundred trees in one winter, while another is recorded to have killed a couple of acres of timber.

It is tolerably quiet; easily tamed, but subject to sudden fits of alarm at any strange object. When attacked, it draws its legs under its body, shoots out its quills, lashes around vigorously with its bristling tail, and woe to the foe that encounters its sweep.



THE CRESTED PORCUPINE.

THE RED-WINGED STARLING.

The Red-winged Starling, commonly known by the name of Blackbird, is widely met with from Labrador to Mexico. It is both a friend and an enemy of the farmer; but while its friendship is unobtrusive, its enmity is very flagrant. Assembling in vast numbers the descending swarms blacken the green fields with their presence and obscure the sun with their multitudinous wings. With them the soft immature grain of Indian corn is a favorite food. Swooping on the green stalks, their strong bills readily tear away the enveloping husks till little remains but the bare cob and the shriveled skins of the grain. From dawn to dusk the open devastation is carried on, and despite the utmost display of armed watchfulness by the farmer and his juvenile help, a goodly tithe of his crop falls a prey to these ubiquitous, black-coated pilferers.

They are the Ishmaelites of the country-side, for every man's hand is against them. Not an adult who owns a gun but blazes away ruthlessly at them, not an urchin able to fling a stone but hurls it hopefully at the sable flocks; while even the hawks that throng from afar to make havoc among them, cease for a moment to be regarded as the foes of the poultry-yard and the butts of its owner. After their day's pillaging, at night they are in the habit of resting among the profuse reeds growing in swampy and low-lying places. Then, not unfrequently, vast numbers of them fall victims, during the hours of darkness, to the wrath of those whose fields they have plundered; to the love of destruction inherent in human nature; and to the partiality for game not unknown to the human appetite. While wrapt in slumber, their roosting-places are stealthily invaded, the dry reeds set on fire, and as the startled birds dart wildly about, those that escape the smoke and the flames, generally fall victims to the ready sticks or guns of their excited assailants. A single night often witnesses the destruction of thousands of birds in this way; and as their flesh is quite edible, though not remarkably savory, many of their destroyers return to the scene next morning to pick up the game.

In this world of ours it is the rule that injuries are punished far oftener than benefits are rewarded, and so it is always with these Starlings. Constant enmity and frequent death follow them for their depredations; while but scanty thanks are ever felt for the good they do. Yet this is by no means small. During early spring they feed almost exclusively on insects, showing a benificent preference for those that in the larval state are devouring the young leaves of growing crops. As their own existence as well as that of their young depends on their obtaining a liberal supply of these, they hunt them with very praiseworthy perseverance. Whether the grub be deeply buried in the earth eating away the root of some doomed plant; whether it be concealed amid the thick foliage which it is consuming; or whether it be tunneling a passage into the living trunk of a tree, the Red-wing Starling detects its presence and drags it from its hiding-place. From numerous dissections, Wilson, the celebrated ornithologist, calculated that each bird eats at least fifty larvæ every day, and probably very many more, and that all the Starlings of this kind in the country destroy sixteen thousand million noxious insects during the season, even if they do not touch a single insect after their young are able to shift for themselves. In the North the birds are migratory, but in the South some of them remain the year round. There they are accordingly very numerous in winter, and collect in immense flocks on the rice and cornfields, where their ravages are even more disastrous than at the North. The males measure nine inches in length, are of a beautiful glossy black color, with scarlet shoulders. The females are

only a little over seven inches long; are a brownish black above, mottled with brown or white. Over each eye are two cream-colored stripes, while the lower surface is of a whitish cream-color, streaked and spotted with black. They pair about the middle of April, and build their nests generally a fortnight later, usually in marshy places, close to the earth or on the bare ground. The nest is generally composed of rushes and long grass, and lined with some soft material. In it are commonly laid five eggs, pale blue, slightly tinged with purple and marked with lines and spots of black. The young male and female birds are alike, but soon the plumage of the former begins to show the distinguishing reddish markings on the shoulders. When captured young the birds soon accommodate themselves to the situation; grow quite familiar with their owners, are fond of uttering their somewhat monotonous but not unmusical notes, and seem to be highly delighted with their performance.

Farm Topics.

MR. MECHI'S STATEMENT TO HIS VISITORS.

July 10th, 1878.

[This statement with which Mr. J. J. Mechi of Tiptree-Hall Farm, England, favors us, was received just too late for last week's issue.—Eds.]

Once more I am gratified to see around me a band of agricultural improvers, and of men interested in land. As this will probably be my last agricultural gathering (for I was 76 last May,) I make the following statement:—

My object in commencing and continuing these gatherings has ever been to stimulate to an improved agricultural practice, knowing, as I do, that the land of this kingdom, taken as a whole, is not half farmed, and that our home-grown food could be considerably and profitably increased by an additional investment of both landowners' and tenants' capital. Facts justify this conclusion, for, while in some well-farmed districts tenants' capital is £20 or more per acre, and the landowners' improvements have involved great costs, the average tenants' capital of Great Britain is estimated at, or under, only £6 per acre, and in Ireland at £1 less. The landowners' capital is probably £30 per acre. In consequence there is a low scale of production and profit, and a dependence on foreigners for more than half our daily bread, and much of our meat, butter, cheese, potatoes, &c.

There is not the excuse of want of capital, for it is in excess of our home utilization of it, so we loan it to other nations, to the extent of several hundred millions sterling, and thus enable them to grow food for us, and to compete with us in trade, commerce, and manufactures. An improvement of our land laws and a commercial practice applied to agriculture would tempt capital, and keep more of our money at home; but British agriculture is still shackled and fettered by antiquated land laws and restrictive covenants. Its feudal conditions still linger and struggle for existence in the midst and presence of a free, gigantic and wealthy commercial development, where millions change hands in minutes and hours, in printed slips of paper, such as bills of lading, commercial bills of exchange, &c.; while an acre of cold clay, worth £30 or £40, has a ceremonial of musty parchment and antique history, involving an unendurable delay of cost, time, and uncertainty.

In commerce, possession by a respectable person is an evidence of ownership. If you want to buy or sell a million of consols, you walk up to a comfortable old gentleman at a desk in the Bank of England, you are accompanied and identified by a known stockbroker, the buyer and seller sign their names in a book, and the million has changed owners. It is a disgrace that we have not public land register offices for cheap and ready transfer.

In 1841 I purchased Tiptree-Hall Farm (all freehold, except 17 acres) for £25 per acre. It has been since valued by eminent and opposing valuers at £50 per acre; and I believe that, even without the house and gardens, it would command nearly that sum. It is a notable and encouraging fact that in 1868 (a good wheat year) I sold the wheat crop off Willow Field, with its straw, at £29 4s. per acre, being £4 4s. more per acre than I paid for the purchase of the land. The wheat was sold for 63s. per qr. The following year I grew on the same field 7½ qr. of Rivett wheat per acre.

I have resided on the farm for 35 years, and all my children were born here; and, thanks to drainage and open fields, with pure air and good water, our doctor's bill has been at a minimum. My first act of improvement was to remove all fences and trees, drain every field, then deeply subsoil and well manure the land. Good roads were made, and sufficient buildings were erected.

I am pleased to be able to say that my endeavor to improve the general practice in agriculture has not been entirely unsuccessful—at all events, in this neighborhood, for great changes have taken place. The country has been cleared, land drained, new buildings erected, including especially covered yards. Within sight of my house my neighbor, Mr. Harvey, who is with us to-day, has recently erected some very excellent ones at a cost of many hundred pounds, and he finds it pay, and is prepared to say so.

When I first came here labor was in great excess and small demand. Now the reverse is the case. Wretched hovels are being superseded by decent cottages, and, in fact, all round here we are on the "improved track." Church, chapel and school accommodations have marched with the rest, and we are a changed, and, I believe, improved people. So much for once poor Tiptree.

THE GREAT AGRICULTURAL QUESTION OF THE DAY

is how can we so profitably improve our general agriculture (especially our large area of inferior waste land), so as to enable us to withstand the competition of fertile and foreign countries, where, as in the United States, India, and other colonies, immense areas of virgin soil can be had at a nominal cost, and with a more favorable climate than ours? My 35 years' experience on this farm, which is naturally a poor one, is that it can only be done by improvements, effected jointly by the action of land-owners and tenants—and by the abandonment of certain unprofitable, antiquated practices and conditions. All this means a larger arcable capital, both by land-owner and tenant.

We thought we were safe in the matter of meat, but that comforting illusion is being rapidly dispelled, for mighty steam has so bridged the wide ocean, that, aided by chemical science, foreign meat, alive and dead, may be said to walk into our markets side by side with our own supplies.

This is a land-owner's quite as much as a tenant's question, for non-profit must result in low rents.

Agricultural improvements will evidently fail to keep pace with our rapidly increasing population. Obsolete customs and habits are difficult to eradicate. Some idea of the capital required to amend our 47,000,000 of mixed acres may be deduced from the fact that only 1s. per acre amounts to £2,360,000. My improvements cost nearly £25 per acre. His Grace, the Duke of Sutherland (whose representative, Mr. Wright, we have the pleasure to see here), is expending £25,000 annually in reclaiming 1000 acres of his Scotch property, which represents 1,260,000 acres. Its present rental averages about 1s. per acre. Its future, or improved rent, will, no doubt, be 25 times that amount. On our 47,000,000 of farmed acres, £25 per acre would amount to the enormous sum of £1,175,000,000 added to the first cost of the land, so that there need be no hope or fear of our arriving quickly at the end of agricultural progress.

MEMORANDUM.

I take this opportunity of laying before you my views on several important agricultural questions, and I also add an account of my cropping, which is similar to that of other years:—

CROPS AT TIPTREE-HALL FARM—1878.

13	acres of	Taunton Dean wheat.
7	"	Golden Drop wheat.
	"	Club-headed Rough Chaff wheat.
	"	Square-headed wheat (apparently a cross between the old White Chaff Red and Piper's Thick-Set).
9¼	"	Suffolk Red wheat.
~~2¼~~	"	Rivett wheat (taken as usual after ordinary wheat).
6	"	Giant White wheat.
12½	"	Barley (taken as usual after wheat).
6½	"	Black oats (after a green and root crop in 1877).
17½	"	Blue peas.
7½	"	White peas.
4	"	Champion peas.
5	"	mangel.
2	"	kohl rabi.
4	"	cabbage.
3½	"	winter tares.
13	"	Red clover (for hay).
8	"	Italian rye-grass (1st year).
6½	"	Italian rye-grass (2d year).
6	"	permanent pasture for hay.

LIVE STOCK.

19	fattening cattle.
1	cow.
231	sheep (we breed them).
7	working farm horses, several of them very old servants, and must soon go.

AGRICULTURAL COMPETITION.

Although the reduction of rent is a gain, it is not that only which will save a farmer. There is a severe and, I fear, fatal competition going on and increasing between the ancient and modern farmer. The latter, with larger means and with all the mechanical and manurial aids of recent times, can and does produce his crops at a much smaller percentage of cost than his ancient competitor who may be deficient in these advantages. Landowners should consider this, and, by doing their share of progress, stimulate the adoption of a new and improved practice. Covered yards, drains, and steam in the field and at the homestead, deeper cultivation, the horse hoe, reapers and mowers, open fields, and suitable accommodation for abundant meat-making, are all elements in diminution of cost per bushel of grain, or pound of meat. So are the cutting up of straw and green crops, and the pulping of roots. The use of iron hurdles on wheels, and sewage irrigation where possible, pays.

PASTURE OR ARABLE.

I have been a good deal snubbed for strongly recommending the abolition of poor permanent pasture, and my critics, who farm their grass-land well, are rather hard on me, not observing the words "poor" or poorly-farmed pasture, where the practice is too common of feeding the sheep on pasture by day and folding them on the arable land at night—robbing Peter to pay Paul, or removing money from one pocket to another without gain or increase. The consequence is an exhaustion of manurial element, and a growth of weeds or inferior plants, which can exist where the better grasses have died out.

My plan of making grass pay is to fold sheep on it, and bring to the fold plenty of cake, corn, malt, culms, or other food. Where this is done, and the climate is suitable, grass-land often pays better than arable, because there is a minimum of horse and manual labor, and a saving of seeds and expensive implements and machinery. But now the statistics show a miserable estimate of hay cut—as only 18 cwt. per acre, and no doubt much of it poor in quality, for we have tall grass and hay made from it, which has little value for feeding purposes.

Bad farmers are safe and free from restrictions; they must not sell their hay, but they may sell the essence of it in the shape of milk, cheese, and lean stock, without the purchase of artificial food or manures, and they thus exhaust the soil.

DIFFICULT FARMS TO LET.

I could name a district in Essex where not a farm is to let, and where there would be many applicants for a vacant one. Around and near this district is an extensive area of dense clay farms, for which tenants can be only now obtained by a very considerable reduction of rent and other favorable conditions, such as a year's rent free, freedom of action, and perhaps only 10s. or 12s. per acre rent. In warm, dry seasons, when the land cracks widely, these lands produce abundant grain, mangel and clover; but in wet seasons they are unfruitful, and are always costly to work, requiring very powerful and expensive horses. Too many of these farms are undrained, and even when drained, woe betide the stranger who imagines that deep, open furrows and water furrows are unnecessary.

The most successful farmers of these lands are those who, immediately after harvest, plow out their furrows and water-furrows, so that when the winter rains come, the water may find a ready escape, instead of soaking the clay into dense mud. The plowed land, or seed-bed, is thus kept in a somewhat friable condition, and the horses can walk in the furrows, instead of plunging into deep mud.

Sheep cannot be kept on these lands in winter, hence their unacceptability. Covered yards and steam plows owned by the farmer are the best modifiers, for an opportunity lost is irrecoverable. The farmer must use his steam plow exactly at the right time—the happy opportunity.

STEAM PLOWING COMPANIES

are, I fear, too often unprofitable both to owners and farmers, and the causes appear to me very obvious, especially in a stiff clay or undrained district; for, during wet weather, they are unavailable on the muddy adhesive soil. When a farmer has his own steam plow he can choose his opportunity, and when not in use, the engine which works it, and the attendant, can be otherwise employed on the farm, but in the case of hired engines the drivers must be paid, work or no work. And as a result, the price charged to the farmer is much more than if he used his own tackle.

The removal to and from distant farms involves a heavy cost for fuel, wages, wear and tear, all which culminate in a far too heavy charge for the farmer's profit. It appears to me, clearly, that the farmer should be able to use his own tackle just when he finds it most profitable or convenient to do so. He can thus plow, cultivate, harrow, or roll, just in the way or to the depth that he chooses as most suitable, and, in my opinion, at half the cost of hired work. His engines and driver will be employed mostly at other work, and he has merely to incur the interest of money on the tackle when not in use.—J. J. Mechi.

The following is taken from an account of the visit to Mr. Mechi, published in the London Times, the next day:

"Tiptree-Hall Farm.—A party of Gentlemen interested in Agriculture, including Mr. Read, M.P., Sir T. Acland, M.P., Mr. Morley, M.P., and Mr. Pell, M.P., visited Mr. Mechi yesterday at Tiptree Hall. The London contingent left Liverpool-street station at 11 o'clock, and at Kelvedon station they found vehicles waiting, in which they were conveyed, through pleasant country roads, to Tiptree-hall Farm. Many of the neighboring agriculturists were already on the ground, and the whole party was welcomed with characteristic cordiality by Mr. Mechi. The leading features of Mr. Mechi's farming are well known. As he himself says, 35 years ago, when he purchased Tiptree-hall farm, he was considered a revolutionist. He was a leveller in a double sense. He not only disregarded the old notions as to drainage, but he cut down all the trees, removed the cumbrous and weed-producing fences, put in their place light iron hurdles on wheels, applied manure lavishly, made good roads, and erected strange-looking buildings, some of which now, owing to the general application of steam to the work of the farm, resemble more a manufactory in Lancashire than a farmstead in Essex. The visitors first examined the live stock, and it was made sufficiently clear that Mr. Mechi's system had not injuriously affected his interests as a breeder and feeder. The grain crops were in fine condition, though in two places deficiencies in the barley were observable. Compared with wheat seen before Tiptree-hall farm was reached, Mr. Mechi's was luxuriant; and when it is remembered that his land is naturally poor, the contrast was even, it may be said, remarkable. Of the complete nature of the change which has passed over Mr. Mechi's farm, perhaps it's only necessary to mention that whereas in 1841 he purchased the land, nearly all freehold, for £25 an acre, it has been since valued at £50 an acre. But at what outlay was this change brought about? Mr. Mechi says his improvements cost nearly £25 per acre. His improvements are not all, however, sunk in the soil. His interested visitors noted the covered yards, the steam machinery in the field and at the homestead, the suitable accommodation for meat making, the iron hurdles on wheels, and sewage irrigation. Deep cultivation, drains, and sewage irrigation have effected much at Tiptree-hall farm; but energetic application of all the scientific improvements connected with husbandry has helped in at least an equal proportion."

DAIRYING AND GRAIN RAISING.

E. W. STEWART.

The temptation during the first fifty years of the settlement of all our States has been to raise constant crops of grain, and, making no use of the straw for feeding, it has been burned to get it out of the way. If the straw were evenly distributed over the field on which it grew and burned, it would return a large proportion of the mineral constituents removed in the grain crop, but this is never done except when the header is used. It is necessary that some compensation should be provided for this great draft upon the fertility of the soil. The only permanent compensation to the soil for the losses in crops is in stock feeding. Every country that has held a respectable position in agriculture has done it by feeding stock to its full capacity. England has doubled her wheat production during the last fifty years, and has also doubled her stock feeding. She has besides shown her wisdom in using immense quantities of bones and guano.

This country is fast becoming the grain producer for a large part of Europe, and is no doubt destined to greatly increase this surplus of breadstuffs; and is it not high time that our farmers had entered upon the practice of a settled system of compensation for their depletion of the soil by cropping? Our dairy products are finding new and wider markets, year by year, and I believe are yet destined to reach as high figures as in meat exports. Dairying is admirably adapted to be the complement of grain raising. Its product is marketable at all times of the year. The returns may be had from month to month, or even weekly, and this assists the farmer in paying expenses between the annual crops. The cow gives a better return for the food consumed than the steer—that is, her product brings a much larger sum than the growth of the steer. The average cow produces about 4,000 lbs. of milk, which will make 400 lbs. of cheese, or 180 lbs. of butter. This cheese will bring during any series of ten years, at least $40, and the butter $45 to $50, whilst the growth of an ordinary steer will not reach more than half these sums. The best cows, as also the best steers, will just about double these figures, but there is generally a large balance in favor of the cow over the steer; besides the return for steers only comes once in two and one-half to four years. I advocate the propriety of keeping only the best cows and the best steers, for the profit must be very small on the poorer classes of stock, kept for any purpose; but our comparison is drawn between the averages of such as are generally kept.

Grain raising produces a large amount of straw, which, by a little study of the combination of foods, will enable the farmer to carry his cows through the winter. A little grain mixed with straw will give a proper balance of constituents. The grain farm may have plenty of land near the barn in condition to raise those annual summer green crops adapted to feeding milch cows. These are winter rye for early spring soiling or pasturing—rye makes good pasturage—oats, oats and peas; vetches and oats; Hungarian grass, millet and Indian corn. The oat and pea crop (one of oats to two of peas) makes one of the most desirable combinations of food for the production of milk. It should be cut when the pea is in blossom. Hungarian grass on a light and fine soil produces a large growth of excellent food for feeding green, or even for pasturing, if not fed too close, and also makes excellent hay if cut and cured before blossom. It becomes too woody if allowed to ripen. The same may be said of millet. But for profitable stock feeding or dairying, much reliance should be placed upon clover, both for pasture and winter feeding. Clover fed with straw in winter—an equal weight of each—makes a well-balanced food. Grain land should have clover every third year in the rotation. The clover penetrates deeply and brings up the dormant fertility of the subsoil. The roots ramify so extensively and furnish such a body of vegetable matter to decay in the soil as to furnish an important ma-

nuring. Clover, being freely raised and fed to cows in connection with straw and surplus grain, will not only produce milk profitably, but will compensate the soil for grain raising.

THISTLES OR NO THISTLES?

JUST before the thistle, or in fact any biennial or perennial weed, is ready to flower, cut it down to the ground, or a little below, to be sure to kill the eyes about to form, and the plant's growth is stopped. If the eyes upon the collar or running roots once get ripe—although dormant till next season—the plant lives. This time—only about two weeks between budding and blooming—is their critical term. Taken at this time, all last year's eyes have got above ground, and the seeds are not yet formed. No salt, kerosene or doctor's stuff is required—only pluck and elbow-grease.

Field Crops.

TIMOTHY AND ORCHARD-GRASS.

THEIR GOOD QUALITIES AND THEIR DEFECTS.

PROFESSOR. W. J. BEAL.

A PERSON who is familiar with all the good points and defects of our domestic animals knows what to select for his especial purpose. Just so with the grasses. Bnt these are rather small and most of them look alike to a person who has little or no knowledge of botany. Although farmers are among some of these grasses from boyhood to old age, yet most men die ignorant of the names and peculiarities of the majority of valuable grasses.

TIMOTHY.

Timothy looks unlike any grass with which farmers come in contact. It resembles Meadow Fox-tail a little, but it is larger, coarser and the spike (head) is longer and rougher and the plant flowers appear a month later. Timothy produces an abundance of seeds of some size which are easily cleaned and quite sure to grow. These traits, with the large size and early maturity of the timothy-plant, are much in its favor. The quality of grass is excellent. In a good season in favorable soil, it yields a large crop of good hay which every man has learned to recognize. But few could tell the hay which was made of Orchard-grass, Fowl-meadow-grass, or Meadow-fescue. It might be just as good or even better than the load of Timothy, but they would prefer the latter, because they then know what they are buying. A good new pear, or apple, or strawberry or squash will not meet with ready sale till buyers become acquainted with it.

DEFECTS OF TIMOTHY.

Some of the defects of Timothy are these: It flowers rather late, two or three weeks later than Red Clover with which it is often sown. It starts rather slowly in spring and after it is once mown in summer, produces no seed and but very little feed or very little to mow. It very soon disappears in pastures as stock eat off the bulbs at the base of the stem. It does not spread to occupy the space left by annual weeds or by Red Clover when they are dead. It is the fashion to sow Timothy or Timothy and clover and has been for many years.

ORCHARD-GRASS.

Orchard-grass has been well-known for many generations in Europe where it is a great favorito. In the Old Country farmers pay large rents and they are obliged to watch very closely the expenses and the income. They prefer Orchard-grass, Cock's-foot as they call it, to Timothy. In this new country, in Michigan and Illinois at least, it is astonishing to see the ignorance which prevails among farmers as to Orchard-grass and many others of value.

Orchard-grass starts very early in spring and gets its growth and produces flowers three or four weeks before Timothy. It grows about the same hight as Timothy and if sown thickly on suitable land, and *cut at the proper time*, will yield nearly, or quite, as much—and sometimes more—grass of about the same quality. It may be cut and *must be cut early* to make good hay. After cutting it starts very quickly and is soon up ready for cutting again or for pasture a long time during the rest of the year. It bears pasturing well. For meadow or pasture I have known it to last ten or twelve years, and then appear thick and thrifty.

SHORTCOMINGS OF ORCHARD-GRASS.

What are the drawbacks in raising Orchard-grass? Why is it not a universal favorite for use in place of Timothy and for other purposes? Some of the reasons, if they are worthy the name of reasons, have been given: In some places, as on gravelly plains, Orchard-grass is said not to have done well. The seeds are light and sold in the chaff much of which contains no seed. A few seeds cost too much money. Sometimes the seeds are injured in harvesting and curing, or are kept too long by seedsmen, as they have to supply only a limited demand. Of well-filled seed, it takes from two to four bushels to the acre to produce a thick growth. It starts so early and grows so fast and flowers so soon that probably not one farmer in one hundred thinks of cutting it as soon as it is ready. He waits for the clover to show more flowers or for good weather or something else, or he is not used to haying so early, and his Orchard-grass is going to seed before he knows it. He cuts the grass, cures it, and finds the hay poor and woody. I believe the hay is often condemned because the mowing was not done at the proper time.

ORCHARD-GRASS WORTHY OF A TRIAL.

Orchard-grass is worthy of a good trial on every farm or in every neighborhood. I have, within the past ten years, induced a large number of farmers to give it a trial on a small scale. I have visited some of their farms and have frequently talked with the owners. The grass has been tried on quite a variety of soils. Of those who have been influenced by me to try Orchard-grass, I have yet to hear the first case where it has not given excellent satisfaction whether used one year, two years, or many; whether sown for meadow or pasture; whether sown alone or with Red Clover, Timothy or other forage plants. Let all give it a trial; study its peculiarities and do not condemn it without good reasons. PROFESSOR SHELTON tells us that it is one of the best for producing hay in Kansas and Nebraska.

AN OLLA PODRIDA LETTER.

PHLOX, ETC.

EVERY evening when Anaximander returns from the city, he is very apt to remark that the "bed of Phlox is really very beautiful," and this has been being said for a month, and there is no abatement in the rich beauty of the Phlox plot. Some writer in the RURAL complained, some time ago, of the bad habit of Phlox, its proneness to fall down, etc. I have no such trouble with mine. The plants are transplanted from the hot-bed at a distance of not more than three or four inches apart, and they grow up, branch out, and "stand by" each other in mutual self-support, and, when in bloom, present an almost solid surface of gorgeous color. There are twenty-five or thirty varieties in the bed of which I write, and that it is a glorious feast for the eye one can readily believe. I think the only true way to cultivate it is to mass it, and one can not have too large a bed of it, and if one has never had it in her garden or lawn, she may rest assured that there is a great store of beauty in the possible future for her. Take my advice and have a plot of Drummond Phlox next year.

PETUNIAS.

Nearly opposite my Phlox, is a large bed of Petunias—an almost numberless variety of beautiful shades and combinations of shades and colors, and this, too, is a continual feast for the eye. For filling vases I am very partial to Petunias, as they keep their freshness well, and give a brightness and frank-looking-ness to a bouquet, that nothing else so well does. Sprays of "Kenilworth Ivy" or of Smilax, falling from the top of the vase and draped about its stem, often give a pleasing gracefulness to its appearance.

To return to the Petunia, I find considerable interest in observing the varieties that will be produced by the seed from one pod. This year, I sowed the seed of one pod, that was pulled from a very large and rich Petunia—a velvety sort of blossom, nearly if not quite, three inches in diameter—and from that pod I find seven varieties, and not one like the original.

PANSIES AND POPPIES.

I do not think I have the right kind of success with Pansies. Last year, my seedlings throve well. I pinched off the flower buds for a month before allowing the plants to bloom, and the blossoms were magnificent; I never saw finer. But the plants grew tall—some of them a foot and a half high—in spite of me. They grew in very rich soil—a shaded place most of the day. In the late fall I put leaves and brush about the plants for winter protection. But not one was found alive this spring. I sowed seed again, and have now a fine bed of them. I keep the flower buds pinched off, and have pinched off the entire top of each plant, hoping to secure a bushy form to it. Is it right so to do? Moreover, some of the plants died from no find-outable cause—the stem separated at the surface of the soil, as if it had worn a corset and been laced until it came in two. What think you was the cause? I kept the soil well opened, and observed all the hygienic Pansy laws that I knew about. If you can tell me how to insure their precious lives throughout the winter, without transplanting, I will be greatly obliged.

[If the situation is shady, the soil rich and the flower-buds be pinched off, what else could be expected but a tall growth of stems and leaves? If then these plants are crowded the stems become weakened near the ground and will not stand the winters.—EDS.]

I have a clump of Poppies—almost the first mentioned flower in antiquity—that look like Passion Flowers from the window near which I write—various colors, masses of fringe with a pale-green heart surrounded by a border of dainty workmanship. The infinite pains, and the exquisite beauty that nature puts into some flowers—into most flowers—are a never-ending source of wonder to me.

MORNING-GLORIES, ETC.

I always gather my own flower seeds. This requires much time and patience, but in order to become well acquainted with flowers, it is necessary to observe their seed-producing habits. Of other seedling flowers in bloom just now, I find great pleasure in the rose-colored Vinca—the bright intelligent-looking blossom enthroned on a mass of rich green leaves, is a bouquet in itself. A mass of Viscaria gives a delicate and pleasing effect, and a group of red and white Malope looks well. A large bed of double, summer-blooming Chrysanthemums is very fine. The seedling Geraniums, scarlet and pink, double, are very showy, but except for bouquet-making, I do not care half so much for Geraniums as for Morning-glories and Portulaca. If any body judges of Morning-glories from the ordinary pale blue blossoming vines, that are more commonly seen, she knows nothing of the *glory* of the flowers. Imagine a curtain of green, starred with the richest hues of crimson and blue, that is violet in its depth of color and richness, and white, with delicate lines of blue or lavender, and mottled blossoms and yellow, too, if one chooses, and you will begin to understand why these flowers are called the Glory of the Morning.

HOLLYHOCKS.

I want to add a word about the Chater Hollyhock, the seeds of which came from the RURAL office last year. The Hollyhock has been in bloom for some time and the blossoms are, in school-girl parlance, perfectly elegant. A pretty neighbor of mine finds them "lovely" for the toilet, placing one in her hair, another at the throat, one on each arm, and fastening them in the drapery of her skirts. They form the most exquisite rosettes—being perfectly double, triple and quadruple, and sextuple for that matter, and of a delicate straw-color—for toilette decoration that can be had, especially against a frock of black grenadine, or of pure white. They form plate bouquets of striking beauty, set in a background of dark, crimson Phlox.

MARY WAGER-FISHER.

BULBS FOR THE FLOWER GARDEN.

W. C. L. DREW.

OXALIS.

FLOWERS of this kind are very popular for winter-flowering in pots, but they are no less desirable for border culture. The bulbs of all the varieties are small, but produce an abundance of bloom and foliage, the latter being almost as handsome and in every way as desirable as the many-colored flowers.

As I shall not speak of these bulbs again, I will, for the benefit of amateurs, give the most approved plan for potting them. Bulbs desired for pot culture should be kept strictly for that purpose and not be made to do extra service by occupying a position in the border during the spring and summer seasons. In potting the Oxalis, five or six bulbs may be planted in a six-inch pot. This should be done as early as possible in October or November.

Having clean pots ready, place an inch of drainage in the bottom; then fill the pots half way up with well-decayed manure; the rest of the pot should be filled with fresh light loam or leaf mold; in this plant the bulbs one inch deep; water and set in a cool, dark place for ten days, when the pot should be brought to the light. After flowering, when the foliage begins to turn yellow, they should be dried off. When dry, transplant the bulbs into pots of fresh soil and let them remain until the following October, when they will again start into growth.

For border culture, there are few more desirable subjects than the Oxalis, and those who plant it for its summer-blooming qualities will be more than satisfied with the result. During the entire season it will thrive and bloom, being continually covered with its pretty flowers.

In cultivating the flower for this purpose, set the bulbs one inch deep in the soil, which should be light and rich; for, while it will flower in a common poor soil, no plant will better repay a little extra care in the way of a good dressing of well-decayed manure—no rank manure must be used, as it injures the flowering of the bulb. In the autumn, the bulbs must be taken up, dried off, and packed in fine sawdust. They should be kept in a cool, dry place until the following spring, when they may be planted as before.

VARIETIES.

O. VERSICOLOR.—This is one of the most desirable varieties for winter-blooming. The bulbs of this variety are very small. The flowers are handsomely variegated, the ground-color being a pure white with an eye of the brightest yellow bordered with crimson.

O. BOWIEI.—This is also a winter-blooming variety, and makes a fine contrast with the former. The flowers are of a bright rosy pink color.

O. LUTEA.—This variety is sure to give satisfaction in window culture, as it never fails to bloom. The flowers are a rich yellow color.

O. FLORIBUNDA ALBA.—This is the best white flowering variety. It adapts itself to pot or border culture, and should be in every collection.

O. DEPPEI.—This is the best of the summer-blooming varieties. The leaves are quite distinct from those of other varieties; they are of a very bright green color, with a distinct brownish-black zone. The variety is frequently called the four-leaved Oxalis.

O. LASIANDRA.—This is one of the finest plants for edging purposes. The flowers are a rosy purple color, remaining open only while the sun shines. The leaves are in nine divisions. In Eastern gardens this is rapidly taking the place of other border plants.

EVERY-DAY NOTES.

AN EARLY-FLOWERING TRUMPET CREEPER.

I SEE to-day that the early Trumpet Creeper, Bignonia, or more properly Tecoma, radicans sanguinea præcox, as exhibited in a specimen trained over a post, is fully perfected in flower and foliage. This method of training the strong-growing Trumpet Creepers to a heavy post ten or twelve feet high, in the form, as it were, of a tree, is very effective. An excellent way of accomplishing this consists in setting up a tree, cut fresh from the woods, and retaining its main branches. Over these the Trumpet Creepers, and in fact, many other climbers, will develop in their most perfect manner. Most trees should be trimmed somewhat, to permit the climbers to so cover them as to assume the appearance of trees of foliage. The Early Tecoma radicans blooms at least three weeks before the ordinary T. radicans, and bears longer flowers which are also, generally, of a richer color. It is, of course, no earlier than T. grandiflora, and has smaller flowers; but the different color affords variety, and the habit is hardier; that is, less liable to winter-kill.

THE OAK-LEAVED HYDRANGEA.

There are other Hydrangeas more showy in flower, but none of such rich and remarkable foliage as the Hydragea quercifolia. Well named oak-leaved, it takes on a massive vigor that gives grand effect to even a single specimen on the lawn. The foliage is, indeed, admired so much as to obscure somewhat the merit of the flowers, which is really great. Large, creamy-white, changing later into light rose, they really add much to the beauty of the plant. Complaint is sometimes made that the oak-leaved Hydrangea winter-kills, but I have only known this to happen once in ten years, and then the fresh growth of the following summer entirely renewed its beauty. I doubt very much whether a well established plant would ever be totally destroyed by the winter in this climate.

THE PURPLE BERBERRY.

The foliage of Berberis atropurpurea continues to retain its rich purple color almost throughout the summer. This can be said of few other shrubs or trees, which fact, as well as its peculiar erect form and small leaves, gives it special value for producing contrasted effects at this season. It is, indeed, a valuable old shrub, not sufficiently appreciated.

RUBUS ODORATUS

This old, well-known shrub also receives too little employment. The leaves are of quite peculiar form, at a distance reminding one somewhat of those of a grape-vine. But its special feature is the abundant rosy bloom it puts forth during mid-summer. At this season, it behooves us to treasure up flowering shrubs, for they are all too scarce. The Rubus odoratus is somewhat coarse in appearance. It would, however, be very effective in masses.

CLETHRA ALNIFOLIA.

This shrub, now flowering with full effect, has a value very similar to the last, on account of its summer-blooming nature. Otherwise, it is very different, being low in stature with numerous spikes of small white flowers. About Long Island, some knowing individuals are apt to despise it because it is abundant in our woods. It must be, however, grown in nursery-rows before it will transplant readily into anyone's grounds. As it is seldom, however, that anyone attempts to thus prepare its roots for lawn planting, the shrub really continues to be scarce. Used in very considerable masses for ornamental purposes, it may be made very attractive

THE PEA TREE.

Colutea arborescens and other varieties of the so-called Pea Tree still present very pleasing qualities mingled among other shrubs. The bright green, leguminous-looking, very vigorous foliage, and the peculiar rosy-colored pod that snaps between the fingers later in the season, unite effects scarcely inferior to those of the flowers that have passed away.

Flushing, L. I. SAMUEL PARSONS.

Pomological.

VERY EARLY PEACHES.

THERE seems to be no limit to the number of new varieties of very early peaches. Fifteen years ago, "Troth's Early Red" was the earliest peach known to American peach orchards, but following immediately upon the close of the rebellion, as the country was settling down to sowing and reaping again, the planters of peach orchards were introduced to the merits of the wonderful "Hale's Early"—two weeks earlier than any other peach known to cultivators. As the old adage runs, "Every dog has his day, etc.", so the Hale's Early had its day.

The gain in season secured by the Hale's, in comparison with the Troth's Early, created no little enthusiasm among peach growers; but when the startling intelligence skips across the Atlantic that a peach three weeks earlier than Hale's Early—one a better shipper, and wholly free from that rotting on the trees, that made the Hale's unpopular with many—is an unmistakable reality; then, and not till then, do American peach growers catch the "very early peach" distemper in its worst form. Early Beatrice shared the thoughts, conversation, and, I have no doubt, the dreams of thousands of speculators; and while large gains from the sale of trees stand out as a fact, the "day" of Beatrice was not a long one; for American enterprise, stung with remorse at being caught napping by this "English precocity" staggers the Beatrice, and drives into oblivion the Early Louise and Rivers' with the Alexander; and before growers have time to decide fairly between Beatrice and Alexander, news of the Amsden's June—still earlier and better (?) is spread everywhere. Nor does it stop here; for to-day nearly every county in the United States boasts of one or more new kinds of peaches earlier than Hale's Early.

It occurs to me, that if any one thing pertaining in any way to fruit growing, is thoroughly and completely overdone, it is this "Early-peach business." Take away from "the growers" of the country at large all kinds known to ripen in advance of Troth's Early, and where, I ask, would there be any loss outside of what has already been expended for trees at high prices, tillage, etc.? True! we now and then hear of isolated instances where handsome profits have been realized from Hale's, but these instances are only the exceptions to the rule; and while we had first-class testimonials in large supply, establishing the unequaled merits of the Beatrice as a shipper, the facts to-day are greatly at variance with testimonials of commission merchants. Five years back, Alexander, Amsden and Honeywell, were each claimed to be earlier and larger than Beatrice; but the facts here are at variance with the claims, as it would even puzzle the venerable Downing to tell one from the other, if indiscriminately thrown together in a basket; but then, in conclusion, it is a relief to know that "Peaches three weeks earlier than Hale's Early" (as a business), have about all had their "day." J. W. KERR.

Caroline Co., Md.

Miscellaneous

THE TRUTH ABOUT IT.

[UNDER this heading, a number of articles have been prepared by able writers. These will appear from time to time. Their object is not at all to deal with "humbugs"—but with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

FRAUD.

IT is claimed to be a matter of history that the nations which engage in war, as a consequence demoralize their people, rendering life and property less sacred and secure among themselves. It is claimed, too, that with the increase of population in a given area, there is also an increase of dissolute and vagabond habits, poverty, and hunger and the whole catalogue of crimes.

Whether all this be true or not, we can hardly fail to see that ever since the commencement of our late war, peculations, robberies and murders have been more frequent than ever before in our nation's history. Even after making due allowance for the increased facilities for transmitting news, by which the people are more generally informed of passing events, we cannot resist the conviction that we as a nation are going downward in immorality and crime, and that most conspicuous on the list of increased evils is FRAUD. Aside from the frauds which we as individuals see in our own neighborhoods, such as cheating in selling property, adulteration in food and medicine, new and worthless utensils, enticing but worthless patent rights, over-puffed fruits and vegetables, newly named but old and long discarded varieties, scrub stock under the fascinating names of genuine improvements; our newspapers are filled with accounts of gigantic frauds in high life. Doubtless many of these accounts are gotten up for political effect, but too many of them have come to light and been verified for us to disbelieve that there are continually going on, frauds in banks and insurance companies, incendiarism of over-insured property as well as for plunder, defaulting treasurers, frauds in elections and on duties, smuggling frauds and whiskey frauds, and frauds either in the election of the National President, or in the gigantic efforts being made to make it appear so.

Among the minor frauds none is more extensive and more prejudicial to the health and well-being of the community—than quack medicines and quack remedies—These are doubly evil because hidden under the semblance of good, and doubly baneful from appealing directly to the credulity of the credulous public, and especially to those already afflicted with disease. Not that all are bad in themselves, but that all are extortionate in price, and that their patrons discover their good or bad qualities at the peril of health and life.

The remedies for frauds are detection and exposure in their early stages. The press is the greatest engine of exposure, and if the people will patronize and sustain this mighty engine, they may, they can, and they *will* reap a rich reward in this one item of being thus shielded against fraud. When we read of the many cases of "confidence games" we know for a dead certainty that the victims "didn't take the papers." VIEILLARD.

CIDER VINEGAR, AND SUGAR FROM SUGAR BEETS.

SUGAR BEETS are a crop very easily raised, and in good soil the produce is abundant. All cattle are fond of the leaves which add much to the milk of cows, without giving it that bad taste which is unavoidable when they are fed with turnips or cabbages, and which is chiefly owing to the greater rapidity with which the latter undergo the putrefactive fermentation.

The seed is sown in drills 20 to 24 inches apart, and thinned out to the distance of 8 to 12 inches from plant to plant in the rows. From four to six pounds of seed are required per acre, and they should be steeped for 48 hours before planting; the best depth for doing this, is from three-fourths of an inch to an inch; the culture is similar to that of carrots or parsnips, and the cost for seed, labor and fertilizers will amount to about $40 per acre. The yield, according to the quality of the land, the fertilizer used and the cultivation bestowed, will be from 400 to 800 bushels per acre, and the last has been greatly exceeded.

Analyses show that 1,000 lbs. of sugar beets contain 184 lbs. dry substances, 1.60 nitrogen, 7 10 ashes, 3 914 potash, 0.379 lime, 0 536 magnesia, 0.780 phos. acid. In manufacturing these elements are distributed as follows:

	Dry Substances.	Nitrogen.	Ashes.	Potash.	Lime.	Magnesia.	Phosphoric Acid.
Tops and Bottoms	19	0 24	1 15	0.336	0.108	0.132	0.144
Fiber	46	0.44	1.71	0.585	0.390	0.100	5 105
Refuse	24	0.06	1.20	0.380	8.640	0.250	0.380
Molasses	25	0.32	2.47	1.741	0.141	0.009	0.045
Sugar	85	——	0.57	0.873	——	0.040	0.072

After harvesting the roots are first topped, then washed and pulped in a grater, and pressed to extract the juice.

50 lbs.	pressure	to the	sq. in.	ext's.	60	P cent.	of	juice.
80	"	"	"	"	64	"		"
400	"	"	"	"	75	"		"
750	"	"	"	"	80	"		"

Twenty-four pounds of pulp for every 100 square inches of press surface is the best proportion to use. The cider press and grater, made by the Boomer & Boschert Press Co., of Syracuse, N. Y., is worked by power, and has a capacity with the labor of two men of grating and pressing 725 bushels of beets per day, of 10 hours, and yields 3,625 gallons of juice.

The press and grater cost $510, and require less than six-horse power to run them, and the press is the best and cheapest there is for this use. The ordinary cider press will answer, but it costs more to run it, and not as much juice is obtained on account of its not being able to produce as much pressure as the other.

One bushel of sugar beets, mixed with nine bushels of apples, makes a cider richer and of superior flavor to that made from apples alone. Sugar beet juice can be converted into vinegar in the same manner cider now is; it makes a stronger vinegar than cider does, of an equally good but different flavor, and, if treated the same way as maple sap or sorghum juice, it will yield a good article of brown sugar, and all of this not used by the producer in the brown state, would be readily purchased to be refined, by the refineries already established.

To refine sugar requires costly machinery, such as vacuum pans, centrifugal machines, filters of bone coal, etc., and also skilled labor; but the manufacture of sugar from beet juice, requires only the evaporating pan and the addition of some lime to the juice, to neutralize the acid.

The best pan is that made by the Blymer Mfg. Co., Cincinnati, Ohio. 4x15 feet, of copper, costs $210, has a capacity to evaporate 4,000 gallons per day, of 24 hours, and requires three cords of wood, or its equivalent in coal. They also have larger and smaller pans, both iron and copper; the former being lower in price. I have no interest in presses or pans, and mention them that each, for himself, can make an estimate of the cost of the machinery required, and what it will cost to convert his sugar beets into cider, vinegar, or sugar. The estimated quantity of the sugar supply of the commercial world in 1875 was 2,140,000 tons of cane sugar and 1,317,625 tons of beet root sugar, of which latter France produced 462,256 tons as against 4,465 tons in 1828.

The consumption of sugar in the United States is about 700,000 tons, and is constantly increasing. We now produce of cane sugar 100,000 tons, and of beet root sugar 1,000 tons; and there is no reason why this cannot be increased to the quantity we require, if the farmers will raise the beets.

In France there is a heavy tax on the beet root sugar they produce, and cane sugar is admitted free, yet, notwithstanding these disadvantages, they successfully compete with it; here the reverse is the case—a heavy duty on sugar imported and no taxes levied on its manufacture; certainly under these conditions we should produce all the sugar we consume.

After the juice is expressed from the rasped beet, the dry pulp remaining is an admirable food for cattle, sheep and swine. The average amount of pulp is 20 per cent. of the original weight of the beet, and three tons of it for feeding purposes, are equal to one ton of hay, and should be fed in connection with straw and oil-cake or cotton-seed meal.

As the pulp is fed back to stock, the land is constantly growing richer, all the mineral substances taken from it being restored in the manure; this enables the farmer to raise larger crops of various produce, and consequently keep more stock which enables him to make more butter and cheese.

The present cider mills and cheese factories could add to their present machinery the pans or presses as required, and by co-operation on this, as in other products, we can produce profitably all the sugar we require. This will bring the business of sugar-making within the reach of small farmers, and is of vast importance. The notion prevails that to make sugar profitably it must be made extensively. This is certainly erroneous, and the sooner this illusion is dispelled the sooner we shall begin to realize the productive resources of our lands, and employ our now idle laborers on a very remunerative crop now grown to a very limited extent.

ANDREW H. WARD.

Plymouth Co., Mass.

WHAT OTHERS SAY.

WHEAT CULTIVATION.—The editor of The Practical Farmer visited the farm of Mr. Groff, in Lancaster Co., Pa., who has been experimenting on the cultivation of wheat, and last year his experiments were so satisfactory (resulting in double the yield heretofore,) that this year he has put in thirty acres of wheat, and has it in the highest state of cultivation, having worked it through three times this spring; he does not work it in the fall. In cultivating the wheat, Mr. Groff uses a wheat drill six feet between the wheels, and with four sowing tubes instead of eight. Each tube is so arranged with a spreader at the bottom of it as to put the seed in regular rows four inches wide, with nearly eleven inches of space between the rows. The distance between the outside tube and the wheel is the same as between the tubes. This leaves the space between the rows wide apart for the horse to walk between them without treading down the wheat. In using the drill for cultivation, the drilling tubes are removed and the three-clawed cultivating hoes are attached—being the same distance apart as the drilling tubes. The claws of the cultivating attachment are in triangular groups, the center one in advance of the two outer ones, which prevents clogging, leaving the ground even and clean. Protectors are also fastened on to prevent the wheat from being covered up by the dirt as it is thrown up by the claws, and they do the work perfectly. The cultivator leaves the ground fresh, loose and mellow, instead of beaten compactly by the spring rains. The whole thirty acres presented a delightful and pleasing appearance. The wheat looked vigorous, uniform in hight, firmly set, rich in color, having that peculiar shade of green which indicates a healthy state of the plant.

It was compared with adjoining fields on other farms having equally as good soil, equally enriched with fertilizers, and as well put in, but put in with the common drill. There was a difference of almost one-half in favor of the cultivated wheat.

HYDROPHOBIA CURED.—Two Russian doctors lately treated the case of a girl 12 years of age, who had been bitten in the hand by a mad dog. The wound was cauterized immediately with nitrate of silver. In eight days the cicatrization was complete. Seventeen days after the bite, the first symptoms of hydrophobia appeared. The doctors prescribed inhalation of three cubic feet of oxygen. The effect was immediate, and in two hours and a half the patient was quite calm. Two days after fresh symptoms of the malady occurred (difficulty of swallowing and breathing, convulsions, etc.) A fresh inhalation of oxygen for 45 minutes again counteracted these. There remained only a slight difficulty of breathing, and this was overcome by means of monobromide of camphor, the use of which was continued for three weeks. The girl recovered perfect health with the exception of having aphonia—a morbid consequence of diphtheria.

TOO MUCH BUTTER.—Mrs. Mary Wager-Fisher tells the Weekly Tribune that most American families feel that they are deserted by Providence—on the verge of starvation—if they cannot have butter on the table at every meal, and complain of their lack of it as a deprivation hard to be endured. There would be just as much sense in feeling so because they do not have preserved pine-apples three times a day. The very best families in France only serve butter at one meal. Butter with a meat, fish or fowl dinner, would be to them ridiculous, as it really is. But the American—even the poorest one—must have butter on beefsteak and eggs. Mrs. Fisher contends that the manufacture of butter is one of the hardest and most time-consuming tasks that a farmerine has to perform. Moreover, with all the work it involves, butter adds less to the health and sustenance of the family than would the eating of the cream that goes into the making of it. Where one physician advises the eating of butter, a thousand recommend the consumption of cream.

THE TREATMENT OF CHRONIC ALCOHOLISM.—Dr. d'Ancona, of Italy, concludes that

1. Phosphorus is a very useful remedy in the treatment of chronic alcoholism.

2. The medicine is perfectly tolerated in doses which no one has dared to give heretofore—ten centigrammes (nearly 1½ grains) a day for many weeks.

3. The remedy gives to drinkers a feeling of comfort and strength, and furnishes the force necessary to carry on their organic functions, which they have been accustomed to get from alcoholic liquors.

4. The medicine seems also to have the properties of a prophylactic and an antidote, for it causes very beneficial changes in the system, even when the use of liquor has not been entirely stopped.

He uses phosphorus in the form of Phosphide of Zinc.

ABORTION IN COWS.—The London Farmer says: "It is well known that the great proportion of abortions occur in the first and second pregnancies, and this for the following reasons: —Just as a cow is weakened by milking during the last three months of gestation, and thereby predisposed to eject the contents of the uterus, so a heifer, unless very generously fed, will also be weakened, for the reason that nature requires additional nutriment for her as yet incompletely developed body. If this can be avoided by liberal feeding, the danger recurs at the second pregnancy; for the animal is still not fully developed. To avoid this in its turn, the writer allows his young cows to be milked only for four months, when they are pregnant for the second time, and then dries them up. With this precaution he has been almost free from this mishap among his young stock."

ASPARAGUS PLANTING IN SUMMER.—The Germantown Telegraph says: "Select in the old beds new plants, which have sprouted since spring from last year's seeds, and plant in beds of deep, rich soil, of course, removing all the tops, and setting the roots three inches below the surface. Be very careful to prevent the roots from drying while transplanting. Set two feet six inches each way, and when the place or hole is made for the roots, fill with water, and let it alone for a couple of hours for the water to soak away, and then plant. On taking up the young plants they should be put in a pan of water, and taken from the pan one by one as they are set in the holes thus prepared, pressing them in firmly, in order that they may take instant hold of the soil and go on growing, as they will, with scarcely any delay. Asparagus roots thus set will yield sprouts for cutting, one year from the ensuing spring."

GOATS.—It appears that notwithstanding the disfavor with which some regard goats, there has been of late a remarkable increase in the number kept in Ireland. According to the official returns, remarks the Farmers' Gazette (Dublin), it appears that in 1851 there were 235,313 goats enumerated. By the year 1865 the number had dwindled down to 171,207; but the annual returns show that in every year since that date, the numbers have steadily increased, and last year no less than 266,755 goats were returned by the enumerators, being an increase of 95,540 head in twelve years; and, allowing one goat to a family, this shows that in each year since 1865 about 7,962 families have added to their stock a goat which they did not previously possess.

WASTE IN AGRICULTURE.—Mr. Henry Stewart says, in his admirable address before the N. Y. Farmers' Club: "What are we to do then to enlarge our production Let us look at the enorm-

ous wastes which our agriculture perpetrates. What farmer collects the liquid manure or the washings of his barn-yard? Where do all the valuable wastes of our villages, towns and cities disappear? What becomes of the bones, the oil-cakes, the numerous fertilizers that we yearly produce? The first we waste, these last we sell. We buy ribbons and silks and woolen goods with popular foreign brands and wines, and these not half so good as the products of our own looms and vineyards, and pay for them with the life blood of our agriculture."

HIGH FARMING.—The Agricultural Gazette, of London, says: "When crops lie down under the whip of artificial manures and foods, you must cease to drive them further. It seems a pity that production should thus be limited. But little can be done, unless it be by growing short, stiff-strawed wheats; and, if such are procurable, stiff and short-strawed barleys and oats." High farming has its limits—a circumstance, however, of which the farmers in our neighborhood do not much need to be reminded.

WHEN TO PLOW FOR POTATOES.—It is always best to plow in the spring for potatoes or corn that are to be planted on sod ground. If the sod is turned over in the fall, the sod will have all disappeared by the spring and the ammonia generated by its decay will, have passed away.

FARMERS' CLUB.

CATALOGUES, ETC.

G. H. and J. H. HALE, So. Glastonbury, Conn., offer among strawberries, the new and promising, Pres. Lincoln, Duncan, Duchesse, Cumberland Triumph, Forest Rose, Gt. American, Beauty, Crescent Seedling and Sharpless. Among Raspberries, Pride of the Hudson.

FIRST ANNUAL FAIR of the Farmers' Clubs of Massachusetts to be held in Boston on Columbus Ave., opening Oct. 2, and closing Nov. 2. Address Albert L. Murdock, Jamaica Plain, Boston.

PREMIUM LIST of the Nebraska State Board of Agriculture and State Hort. Society for the Twelfth Annual Exhibition to be held at Lincoln, Neb., Sept. 23-27. For Prem. lists or information apply to D. H. Wheeler, Plattsmouth.

ELLWANGER & BARRY, Rochester, N. Y. Descriptive price list of Strawberries. Directions for garden and field culture. Sharpless Seedling a specialty. Circular free.

LIST of Premiums for the Twenty-first Annual fair of the Sandy Creek, Richland, Oswell and Boylston Ag. Society, and list of officers for 1878, to be held at Sandy Creek, N. Y., on Sept. 4, 5, and 6. G. N. Harding, Sec'y., Lacona P. O.

CROP and Statistical Report for June. J. B. Killebrew, Com. of Ag., Nashville, Tenn.

QUARTERLY Report of the Chief of the Bureau of Statistics showing imports and exports of the U. S., for the three months ending March 31, and also for the corresponding quarter of the year immediately preceding.

PREMIUMS and Regulations for the Twenty-ninth Annual fair of the Ohio State Board of Agriculture, to be held in the city of Columbus, Sept. 9-13. John H. Kleppart, Columbus, Franklin Co., Sec'y.

ANNUAL FAIR of the Onondaga Co. Ag. Soc., to be held in the city of Syracuse on Sept. 17-19. Rules and Premiums. P. H. Agan, Sec'y.

CATALOGUE of Bulbs for 78-9. August Rolker and Sons, No. 44 Dey St., N. Y. Hyacinths, Tulips, Lilies, &c. Catalogue illustrated. Free.

MONTHLY Crop Reports of the North Carolina Dept. of Ag. for June. L. L. Polk, Com. Raleigh, N. C.

PREMIUM LIST and Regulations Wisconsin State Ag. Soc. for the Twenty-fifth General Ex., to be held at Madison, Sept. 9-13. Address Geo. E. Bryant, Madison, Sec'y.

L. B. CASE'S Botanical Index to the new, rare and beautiful plants grown at his establishment, Richmond, Ind.

JEFFERSON Co. Ag. So. fair to be held in the city of Watertown, N. Y., Sept. 17-19., Wines R. Skeels, Sec'y.

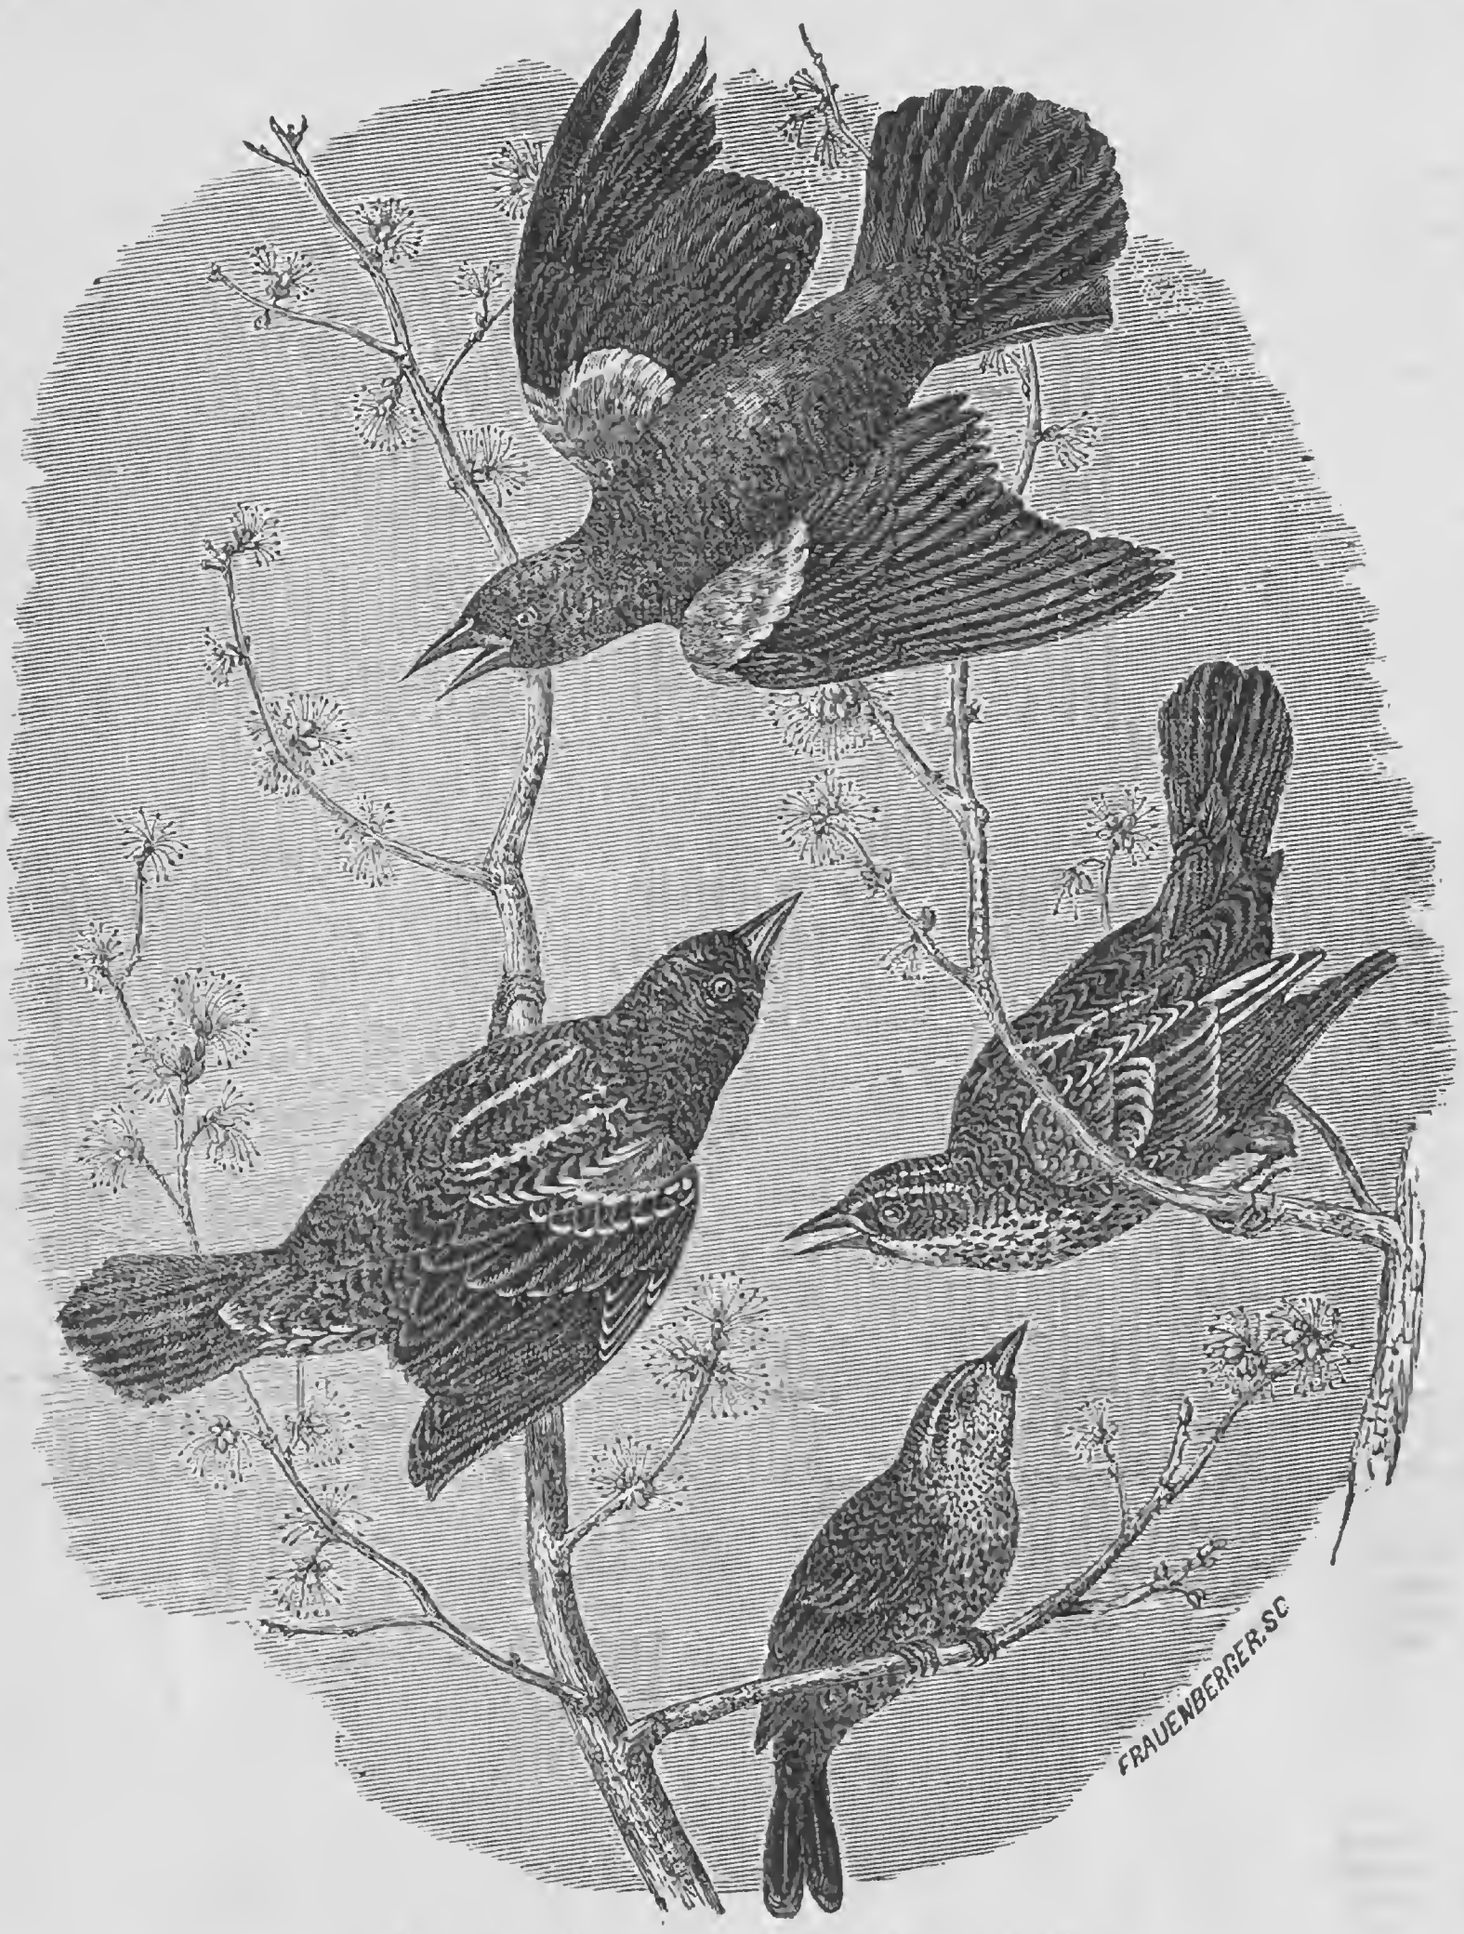
FARM Drainage Circular. For the benefit of those who contemplate underdraining their farms. Illinois Dept. Ag., Springfield, S. D. Fisher, Sec'y.

PREMIUM LIST for the Twenty-sixth Annual fair to be held at Freeport, Sept. 16. S. D. Fisher, Sec'y.

ST. MARY'S ACADEMY.—This excellent institution, under the control of the Sisters of the Holy Cross, has all the physical advantages that are thought to be most desirable for school situations, and the school itself, under the conduct of the Sisters, has become very thorough in the branches to which it pays particular attention, and is highly esteemed by those whose children have profited by its course of study.

The usual course is adopted, including the foreign languages and music. Especial care is devoted to domestic economy, as it is presumed that to be a good house-wife, presupposes a knowledge of the duties. The school is not local in its influence, which in itself is a favorable point.

The Notre Dame Scholastic, a bright little paper issued by the College, and catalogue containing the usual business information, will be sent to parents addressing Mother Superior, St. Mary's Academy, Notre Dame, Ind.



RED-WINGED STARLINGS.—(See page 501.)

Dairy Husbandry.

FRESH BUTTER FOREVER!

IT is the atmosphere coming in contact with the butter which causes it to become rancid. Keep the two separate and the butter cannot spoil. To do this economically: arrange any kind of a vessel, a keg, jar, or barrel, make up the butter in rolls in the very best manner, cover them with a wet cloth, put them into the vessel and fill up with strong, clean brine, and arrange the cover so that a board or plank on its under side shall press the lumps down under the brine. Then bury the vessel up to the brim in the earth in the coolest corner of the cellar. Never let the brine get below the butter and it will keep for years. This is an air-tight butter case; the butter can thus be kept till the price suits. The butter does not improve in quality by this mode of keeping, therefore make it well if you hope to take out a good article.

WHAT OLEOMARGARINE MEANS.

There it a great deal of science in butter-making, despite the old fogies, and when the maker introduces this science, *con-amore*, the article is always good. But when the new substitute was about to be introdnced, it seemed desirable to give it a highly scientific name, and as it was to supersede a very poor article, it was also desirable to give the latter a rap over the head as a kind of a squelcher. The public knows very well that the largest part of all the butter made in the country is detestable, that it is very *oily* and tastes more like lard than anything else.

Upon these facts, and with a business forethought, was built up the present name of the new product, "*Oleo*," meaning oily, fatty, greasy, rancid and nasty, and "Margarine" a substance containing margaric acid, a constituent of lard. The oil from beef suet, combined with "Margarine," and the addition of some sweet milk—of human kindness—are the constituents of Oleomargarine. Here is science employed to produce an article and also its name, both of which are meant to reduce the production of "fearful butter," and to increase and cheapen the manufacture of wagon grease, for to this condition must all the rancid butter hereafter come.

Here is science in butter-making carried to a high point; it gives an appropriate name to the new article, and sinks the old one to the very depths of disgrace. It is a splendid sarcasm, and if Oleomargarine compels the butter makers to cleanly habits, that will be glory enough for a generation. I say: "Up with Oleomargarine and down with dirty butter!"

S. R. M.

KING'S SELF-ACTING COW-MILKER.

EDITOR OF THE RURAL.—Your card referring to cow-milker, is received. I am not prepared, without longer trial, to give a definite opinion of its applicability to continuous milking, but I am convinced of its great value for occasional use,—so great that no farmer can afford to be without one. In cases of sore teats, or udder, or obstruction, it is invaluable, and may often save the cow as a milker when she would otherwise be lost. For occasional use by weak-handed persons, children or women, when male help is absent or disabled, the milker is also very useful. I am glad to hear that a small size is to be made, as in one of the cases when the milker would be most useful, — that of heifers with small teats—the size sent me is too large to be inserted without difficulty, or I think, without risk of injury by setting up inflammation of the duct.

T. H. HOSKINS.

Implements, &c.

SINGLE OR DOUBLE ROPES FOR HAY-FORKS?

I NOTICED in a recent issue of the RURAL that in writing about horse hay-forks and hay carrying apparatus, you mentioned some of the advantages of a single rope over the double rope for such purposes. I thought you wrote from a theoretical rather than a practical knowledge, and, with your consent, I will give my experience extending over a period of twenty years.

I first purchased a horse-fork, and used a single rope for several years, because a double rope for pitching hay was not known or used at that time—in this section at least. While using this single rope, I pulled out and broke off several rafters, and the team had to draw very hard to lift the forkful. Moreover, it strains and wrenches everything terribly, and, besides, you cannot take as large a forkful. I went to Utica, to the State Fair, and saw a double rope arranged for pitching hay, which worked admirably. The next year I rigged my fork with a double rope, and I think a double rope is as much better than a single rope as daylight is better than darkness to work in—as much better as knowledge is better than ignorance in editing a paper. To be sure the horses have to walk farther, but they can lift as much again with no more trouble, everything goes off like clockwork, and you do not strain and break everything to pieces as you are apt to do with a single rope.

For carrying hay back fifteen or twenty feet a double rope answers a good purpose, but if you want to carry back farther than that, a track and car that you can use a double rope with, are much the best. I used a car with a single rope for a few days, and I pronounce it an unmitigated nuisance. I remodeled the car so that I can use a double rope, and it works like a charm. I carry back about fifty feet. I have a wooden track which I think is far preferable to an iron rod. Some use a wooden track with an iron track fastened to the top of it. This works admirably, and I should think would be the best of all. I have a small cord, with a weight attached, fastened to the car, and when the forkful is let loose from the fork, the car will return to its place over the load, ready for use again. I have at the end of the draw-pole a patent hook, which can be tripped while the horses are drawing, if you choose, thus letting the rope loose from the whiffle-trees, so that the car returns immediately—and by the time the horses get back to the starting point, the man on the load has the fork set and ready to have the team go again.

Some use a patent post, around which you drive, catch the rope on an iron on the top and drive back to the starting point, and by pulling backward on the draw-rope, it slips off from the top of the post, leaving the rope slack and the team ready to start again as soon as the fork is set. To save carrying the whiffle-trees, I had my traces lengthened, by attaching pieces of trace-chain about fifteen inches in length to the whiffle-trees, and hooking the traces to the chains, so that when the horses are returning to the starting point the whiffle-trees drag on the ground, and with this rig a small boy or girl can drive the team—sometimes a great convenience.

Let me recapitulate and put in a nut-shell: Never use a single rope with or without a car. For carrying back only fifteen or twenty feet, a double rope answers a good purpose; for carry back farther than this, use track and car, such as you can use a double rope with. All things considered, I should prefer a wooden track fastened to rafters rather than an iron rod.

Cortland Co., N. Y. J. D. F. WOOLSTON.

The Querist.

ANSWERS TO CORRESPONDENTS.

Planting Raspberries from Cuttings in Summer.

Subscriber, Clinton, Mich., asks, 1. whether Black Raspberries can be propagated from cuttings during summer; if so, what canes should be used—the old or new; in what months should they be set out, and how? 2. He also inquires how he can best protect choice seedling Verbenas during winter.

ANS. (1).—Yes; at any time. Either the green or mature stems of this year's growth may be used. The old cane is worthless and should be cut away as soon as the bearing season is over. The canes which grow this year bear next and then die. If the canes are not cut back they will bend over from their weight until the tip rests upon the ground. This will root and the stem may then be cut off six inches above, and the plant be dug up and set out where desired. For cuttings, it is better to use the roots divided into pieces three inches long than to make cuttings of the stems and propagate in the usual manner.

The root cuttings may be placed in a box—first a layer of cuttings, then of soil, and so on—and placed in the cellar or buried in some high, well-drained ground. In the spring, plant in drills a few inches apart and two or three inches deep. (2). Only by removing them to the house or a dry frost-proof cellar.

How to Get Foul Air out of a Well, and Why it Gets There.

Edward Johnson, Chester Co., Tenn., asks what is the best way of getting foul air out of a well, and the cause of its accumulating there.

ANS.—The foul air in wells is mostly carbonic acid, a gas diffused through the air in proportions of about 4 volumes in every 10,000. It is about half as heavy again as the air, and its great weight tends to keep it in low places—where it is generated by the combustion and decay of organic bodies—and also to accumulate it in pits or unused wells. Unmixed with air it cannot be breathed, but is rejected with violent spasms of the glottis. Flame is instantly extinguished by it when mixed with air in proportion of one to four. Before descending into an unused well or pit of any kind, it is prudent to first lower into it a lighted candle, so as to make sure that it does not contain this fatal element. Wells in the barnyard that are used in winter for watering stock but seldom used in summer, are especially liable to have foul air in them at this season. In August, when the wells are low, it is always a good time to clean them out, but before descending into them, the above precaution should always be taken. If the light flickers badly or is extinguished, measures should be taken to remove the carbonic acid before venturing into it. If there is water in the well, all that is needed to get rid of the foul air is to pump out the water and dash it in again. The water will absorb an equal volume of carbonic acid, and the agitation will allow a sufficient quantity of pure air to mix with that in the well to permit of combustion, so that if a bundle of lighted straw be lowered into it the heat will cause the foul air to ascend. If bunches of lighted straw be thrown into the well, although at first the blaze will be instantly extinguished as soon as it strikes the carbonic acid, yet the heat is more or less retained and setting the air in motion, the foul gas will soon be dissipated. Indeed the pest may be driven out by any mode of ventilation, such as violently agitating the air in the well, exploding therein some gunpowder, or by lowering a vessel containing lighted charcoal nearly to the bottom. Burning coals have the property of absorbing many times their bulk of this gas, and when cooled they may be raised up, reignited and lowered down again.

he Best Cross for Mutton Sheep.

W. L. Mount, Chenango Co., N. Y., asks what cross will produce the most profitable kind of sheep and lambs for the butcher.

ANS.—As a rule, pure-bred sheep are quite too dear to raise for mutton. The fine-wools are small; the long-wools furnish too much fat in proportion to lean, to be profitable to the consumer. The South Downs supply fine-grained lean meat, but they have the drawback of being a trifle small. A cross between South Down rams and Merino ewes produces a favorite class of lambs for the Eastern markets. They are hardy, mature early, and strongly display the excellent South Down points. If these grades or South Down ewes are crossed with a Cotswold or Leicester ram, the progeny will be large, the growth rapid, while the flesh will have a choice flavor. To supply early lambs for the butcher, this is probably as good a cross as can be made, as there is always a demand for such lambs in New York and other Eastern cities, at profitable prices.

When to Shut up Swine to Fatten, etc.

Charles Edwards, Clinton, Co., Pa., asks how soon should hogs be shut up to fatten and at what rate should they lay on flesh, if well fed.

ANS.—If pens are furnished with shelter and water, August is not too early to shut up swine for fattening, as a pound of pork is made much more economically in warm weather than in cold. Little food is then required to keep up the animal heat, and many green kinds of food are available that are out of season in the fall. Hogs enjoy fresh clover, fed every day, with their cooked food or provender. Sweet corn in the green state is also highly relished, promotes thrift, and makes flesh economically. If a pig, put up to fatten and well fed, does not make a pound of flesh or more each day, it is not making a profitable use of its food. A pig of a good breed, nine months old, which has been fattened three months, should weigh 300 pounds, and many of them weigh considerably more.

Grafting Pœonies.

Henry Brink, Cedar Co., Iowa, asks what is the right time for grafting Pœonies, and whether they can be grafted in a cellar during winter in the same manner as apple grafts.

ANS.—We think not. The present is the best time. Tie the graft with bast and cover with grafting-wax, and place in a bed of tan or something of that kind. The tubers will make roots in the fall and may then be taken up and potted and placed in a cold-frame through the winter.

Planting White Pine Seeds.

Mrs. W. H. Carpenter, Warren Co., Ohio, asks when the seeds of White Pine should be gathered, how kept through the winter, and the best way of planting them to insure success in raising young trees.

ANS.—The cones of Pinus strobus ripen in the fall of the second year. They may then be gathered and placed in dry sand through the winter. Plant the seeds the latter part of April in light soil, cover them lightly—an eight of an inch is sufficient. Keep the ground from drying out by occasional watering through a fine rose, and give shade either by shaded lights or evergreen boughs. They will generally germinate the same season.

To Destroy Ant-Swarms.

J. O. Donnell, Lewis Co., N. Y., asks how to destroy ant-hills, as the little pests have multiplied tenfold in his orchard within a few years.

ANS.—We have no personal experience with modes of exterminating ants, but the little pests are so industrious in appropriating every edible substance within their reach that we presume the well-nigh universal insecticide, Paris-green, if mixed with some substance attractive to them, and placed in their vicinity, would exterminate them. Of course, it should be so placed as to be safe from appropriation by children or animals. Very probably crude petroleum or kerosene, either pure or diluted with water, if thoroughly and repeatedly applied, by pouring into the entrances of their nests, would produce the desired result. Carbolic acid and corrosive sublimate, especially the latter, affect an ant colony as poisonous agents. Solutions of tobacco, lime, and walnut leaves, with urine, are also said to be effective in destroying them, although these latter are decidedly inferior to carbolic acid and corrosive sublimate.

NOTES FROM ILLINOIS.

THE FARM.

As I have before stated, we have been rained out here for four consecutive years, and while we had entirely too much rain in May and June, we are now suffering for the want of it. Many vegetables are dying in the gardens.

I secured remarkably early field corn this spring,—a very new and valuable sort, and when six week old it was "midsides" to a large horse, but the dry weather is holding it back so that it will not make its reputed time this year, but will still come out ahead of any other early field corn that yields remunerative crops. Next fall I hope to be able to send you sufficient to test it on the "Rural Farm." It is yellow, of good size, and is not a flint corn.

THE VEGETABLE GARDEN.

I have been passing the season rather pleasantly watching the growing and maturing of new vegetables,—new to me, and this locality, anyhow. The new Queen Onion is indeed all that is claimed for it,—only it is not likely to keep as long with us as it is said to keep,—for the reason that the quality is such that we eat them all "up." Little Gem pea still proves to be the earliest with us. I am testing all the early sorts of tomatoes, and may be able this fall to determine which is earliest for our section. Giant Stutgart radish is the finest radish we have yet raised; as its name indicates, it is large. It was sent out this spring (for testing) by FOOTE of Terre Haute, the originator of "100 days Tomato;" he also sent me a new lettuce, the "Green-fringed," which has no equal unless it is the Hanson.

I am testing, for quality and earliness, about 25 sorts of sweet corn, and while I have the opportunity, I am making all the crosses I can, hoping to originate an early sort as sweet as the later sorts. I believe I am the pioneer in the growing of roots for stock in this part of the State. Those who think a cow can eat nothing but an ear of corn, laugh at me considerably, but I can stand it if they can.

Douglas Co., Ill. DR. A. C. WILLIAMS.

[The Green-fringed Lettuce referred to is excellent.—EDS]

NOTES FROM KENTUCKY.

CARROLL CO., KY., July 25, 1878.

POOR WHEAT CROP.—We have greatly overrated the present wheat crop, as proven by the thresher's tally. One field of 23 acres that was "splendid" and would "go 30 bushels per acre" before harvest, only threshed out 13⅓ bushels per acre. Fifty-one acres on another farm that last year averaged 31, only made 18 this. Another of 60 acres went 30 last and 17 1-10 bushels per acre this year. And the same may be said of the thousand acres of wheat here in Hunter's Bottom and of the entire State where the rust was at all bad.

THE WEATHER.—We are having the warmest and driest season for many years. The thermometer ranges from 90° to 100° in the shade every day, with a strong wind from the south or southwest that is literally parching our late potatoes and pastures, and is rolling the cornblades into mammoth cigars. I am told that six horses died of sunstroke while working in a threshing machine last Thursday, just across the river. (We have steam power on this side.) We have not had even a shower of rain since the 22nd. of last month.

FRUITS.—Blackberries are drying nicely on the vines, but our winter apples are already badly sunburnt. Our Fruit-growers' Association has induced the old and reliable firm of Evans & Co., of Baltimore, to establish a canning factory here and when thousands of bushels of blackberries, peaches, plums, tomatoes, sweet corn etc., can be bought for an average of one dollar per bushel at their factory, I cannot see why they should not make it pay handsomely. This is undoubtedly one of the best fruit regions in the country, and it is strange that it is only within the last four years that capitalists are willing to invest here in this industry. The best of fruit land can be had for $30 per acre; and yet not over three thousand acres are in fruit in this and the adjoining county of Trimble. I do not include apples in this estimate, although they grow to perfection, here; yet we have no market for them at paying prices.

S. E. HAMPTON.

RURAL SPECIAL REPORTS.

CHAUTAUQUA CO., N. Y., July 25, 1878.

FARMERS in this section are just now finishing their haying and making preparation to commence harvesting. The hay crop we think to be fully an average one; on some farms it is even larger than last season. Butter has sold for so low a price during the past few months that it is not to be wondered at that dairymen feel discouraged. When you can buy the finest table butter for a shilling a pound, it is getting down to rock bottom. No farmer can afford to manufacture butter for such figures and pay $14 to $17 per month for farm hands. Those who went into cheese making early in the spring are likely to have the most money this fall. Firkin butter sold here this week at 15 cents—about two cents per pound more than last week. Many are holding on to their summer butter hoping to realize better prices.

Everything is now growing finely. We have had some very warm weather during the past few weeks, which just makes corn jump. Green peas are plentiful, and some new potatoes will soon be in market. Potato bugs can be got along with.

Lake Chautauqua, one of the healthiest and pleasantest summer resorts, is now being visited daily by hundreds of people from different parts of the country. Hotels on the lake are fast being filled by those who desire to spend the heated term at "Chautauqua." The National Sunday-School Assembly commences at Fair Point, Chautauqua Lake, August 3d, and closes August 22d. The Rev. J. H. VINCENT, Rev. JOSEPH COOK and other eminent divines will be present. Pres. R. B. HAYES, of Washington, is expected. The National Baptist Meetings are now in session at Point Chautauqua, Chautauqua Lake, and are very largely attended, Chautauqua Lake is becoming more and more popular each year. M. L. DORMAN.

NEMAHA CO., Nebraska, July 20, 1878.

I WRITE from that region you folks in "York State" call the "Far West"—Fremont's "Great American Desert."

Our State official authorities have just completed a statistical report, showing the population of Nebraska for March, 1878, and the valuation, number of animals, and acreage and yield of the cultivated lands in the State for the year 1877. I came to the Territory of Nebraska twenty-two years ago last April. At that time there was not an acre of land under cultivation for purely agricultural purposes in what is now the State—only a few "Squatters' truck patches." Having been an eye-witness to the progress we have made, it is reasonable that I feel no little pride in what we have done and in letting our friends "Down East" know it.

These official reports show that we now have, under cultivation, 2,358,555 acres. The products were: Spring wheat, 8,712,761 bushels; fall wheat, 55,376 bushels; corn, 32,817,143 bushels; rye, 8,080,090 bushels; barley, 2,401,420 bushels; oats, 5,440,872 bushels; buckwheat, 27,533 bushels; sorghum, 98,973 gallons; flaxseed, 69,018 bushels; broom corn, 685 tons; tobacco, 22,729 pounds; potatoes, 778,330 bushels; turnips, 51,933 bushels; apples, 90,570 bushels; peaches, 17,876 bushels; grapes, 252,250 pounds: hedge fences, 5,212 miles. Of live stock we have: Horses, 130, 295; mules, 12,432; cattle, 433,015; sheep, 99,266; hogs, 497,050. We have cultivated forest trees, 30,346,571; fruit trees—Apple, Pear, Cherry, Plum and Peach—1,758,127; grape vines, 83,721.

Our first census was taken in 1855. The population then was 4,494; in 1860 it was 28,841; in 1870, 122,993; in 1876, 257,717; March, 1878, it was 313,748.

The acreage and farm products for 1878 will average an increase, over 1877, of at least 25 per cent., and, in many instances, of 50 per cent. The crops were never so fine—fine in every part of the State. The greater proportion of this development has been made within the past fifteen years. We have about 1,500 miles running railroads in this State, and some are being built this season.

How does this do for the "Great American Desert;" all accomplished within two decades, and nothing to begin with!

ROBT. W. FURNAS.

SPALDING CO., Ga., July 25th, 1878.

WE have had quite a heated term for two weeks past, the thermometer registering 98° one day last week. Very dry and dusty, and rain is badly needed on garden vegetables and corn crops. Cotton looks well, up to date, and while a rain would not injure it any, still the crop is not suffering. Farmers complain that their corn is cut off at least one-third. The drought coming on just as the grain was in the milky state causes it to dry up and harden prematurely without filling out to the ends of the ears. Peaches have rotted and fallen off the trees worse than I ever saw before; in fact, the middle crop is almost a loss. This we are unable to account for unless the very dry weather in May, followed by a season of copious rains in June, set the sap in motion again, and the new growth, so vigorously started, caused the fruit to fall off and rot. On examination, however, we find that nearly all the rotted fruit, whether on the tree or off, has a small white worm in it. Did the worm cause the fruit to rot? Or did the rot cause the worm to grow? Would be glad to hear from some of our RURAL friends on the subject. We have at last organized a Horticultural Society in Griffin,—W. W. Woodruff at its head, and one of our most enterprising fruit growers. One thing we can brag on, and that is our watermelons. Middle Georgia can certainly be relied on for watermelons from June 15th to September 15th, during which time the "average darkey" is always happy; for he can get a watermelon, large enough to feed his whole family, for five cents, and the warm sun renders but little clothing necessary.

J. G. RHEA.

FLOYD CO., Iowa, July 20th, 1878

WE are having the hottest weather ever known here. Last Friday and Saturday were excessively hot days, the mercury marked 103° in the shade. During the past week it has ranged from 90° to 100°. On the Friday named, at a circus in Osage, Mitchel Co., two performers and three horses died from the heat. The wheat crop will fall far short of that of last year, owing to the excessive rains and intense heat while filling. Blight and rust have done their work, and the grain is prematurely ready for the sickle. Most of the harvesting here is done with self-binders which use wire or cord. They work satisfactorily and do cleaner work than the old method of hand-binding on harvesters. Cost $300 and $325.

Much of the heavy wheat and oats is so badly lodged that only a small part of the crop can be secured. Our crop of hay is immense, timothy yielding 3 to 4 tons per acre. Corn stands six feet high and its growth is so rapid that one can almost see it. The small fruits were very abundant this season and the apple crop will be the largest ever had in this country. Of course, we have no very old orchards yet, but almost every farmer has one just coming into bearing, while a few of the oldest settlers will have hundreds of barrels of choice fruit. Wild plums, generally so plentiful here, are a total failure. The trees blossomed profusely, but the late frost killed them. Potato bugs put in an appearance in small numbers, but suddenly left for parts unknown, and the crop cannot fair

of being good, for which we shall be truly thankful.

I notice your correspondents from various Eastern States mention those pests as being numerous with them. Gentlemen, you have to go for them with Paris-green or lose your potatoes. This is an infallible remedy, a fact that ten years' experience with their depredations has taught us. W. S. McERRON.

HOWARD LAKE, Minnesota, July 23, 1878.

WERE our Eastern and Southern friends to see how we have been melting away, since the first of the month, they would cease fearing that we should freeze to death. So far as I can learn, there has been no such weather in the State before. Right-down sultry, and even a little foggy weather has continued until weeks have come and gone, with but slight change, and that all the time growing a little warmer, till about the 20th inst. when, to our great joy, the "gentle breezes," usually so prevalent here, came to our aid, since which time we are enjoying agreeable harvest weather.

On many of the warmest days I feared for many of the choicest plants which were bedded out, with what at the time I hoped would be sufficient shade; but time and practice have taught me that but few plants can stand much of the sun's rays in the middle of the day, and, although I have hitherto almost made sunshine a hobby, I now feel that one-third sun is better than to put them in more exposed positions. While a few plants have gloried in the sun, others have literally shriveled up, evidently from the intense heat. This is while we have had frequent showers—no drought—seldom any wind. It is said no injury to the wheat can be complained of, as was feared when the sultry weather was so severe. Good corn and potatoes everywhere in this region (unless cultivation was neglected)—beetles easily driven from potatoes—nor did as many eggs hatch as usual.

I have seen similar reports from many localities in this State, with only few exceptions where storms have done mischief by lodging grain. S. A. M.

CORNING, N. Y., July 28, 1878.

IN regard to spring wheat my experience has been rather limited and altogether unsatisfactory. This locality does not seem to be congenial to its successful cultivation. I am certain of one thing, however; it must be sown early, and on light, rich soil, to give good results.

Butter-making with us is not a paying business this season. It only brings ten cents per pound in our market. I never knew it to be so low and such a drug before. Immense quantities of hay are being secured in fine condition. Crops nearly all look fine. Apples are dropping badly. Wheat and barley nearly all secured. Oats are turning. A large acreage is sown to this cereal; but does it pay? I think not. No grain will more quickly impoverish the soil than this; and oats are only worth twenty-five cents per bushel. J. L. N.

MERCER CO., N. J., Aug. 1, 1878.

THERE have been heavy crops of hay, wheat and oats, gathered in good condition in this neighborhood; and we have just had two days of sultry and showery weather, which is favorable for the growing corn. At present this is uneven, but promises well. Potatoes turn out finely; pastures are very flush. Fruit, a scanty crop. Prices low. Wheat (old) $1.15 per bushel; oats (old) 28c. per 30 lbs.; corn 45c. per bushel; potatoes 50c. per bushel; butter 18c. per lb.

D. J. BLACKWELL.

STARK CO., Ill., July 24, 1878.

THE farmers are in the midst of their harvesting. Rye, wheat and oats, give a much better yield than was anticipated a month ago. Corn is looking well, notwithstanding the dry, hot weather we are having. The month of May and part of June were very cold and rainy, but now we are having just the reverse. There has been a number of cases of sunstroke through this part of the country. Harvest hands are scarce, although the country is running over with tramps. HATTIE E. MCCORMICK.

BRECKENRIDGE CO., KY., July 27th.

CROPS are tolerably good, but suffering for rain; we have had none for two weeks. The weather has been intensely hot; indications for rain are flattering now. Oats are heavier than for a number of years. Wheat good, when not injured by rust. Corn promises a fine crop if seasonable. Tobacco looks well.

MRS. M. J. CLAYCOMB.

TRUMANSBURG N. Y. Aug. 1.

We are having bad weather for the harvest, rain or showers every day. Hay all in and a good crop; wheat partly in; heavy growth of straw and a fair yield of wheat, but not up to our expectations, the berry in some cases being badly shrunk. We have a heavy yield of barley. K.

PRINCE WILLIAM CO., Va., July 28th, 1878.

WE have just enjoyed a fine shower which came in time to make our corn, and start buckwheat, as we had had a very dry spell. The corn crop will be quite fair; hay was good; no peaches and few apples. Times discouragingly hard. E. KEYSER.

CAMBRIDGE, MASS.

IT rained hard to-day; we needed it much. Grass and plants generally look well. Evergreens have made an exceptionally fine growth this year. The hay crop was uncommonly heavy, and as a rule is saved in fine condition. Pears are a very light crop; apples heavy. W. F.

HOUSTON, Texas, July 27, 1878.

WARM, but not excessively hot weather here, the highest thermometer stands at 96°. No cases of sunstroke. Plenty of rain, more than needed, a shower almost every dry, therefore weeds in the ascendency. G. M.

MONTGOMERY CO., Ia., July 24, 1878.

OUR harvesting is nearly finished under favorable circumstances, and promises a fair yield. New wheat is being sold at 70c. per bushel.

H. S. WEST.

WHITNEY'S POINT, N. Y., July 26, 1878.

VERY warm; haying well advanced; grass crop better than was expected. M. B. D.

Hygienic Information.

INTERMITTENT FEVER.

DR. GOODENOUGH.

INTERMITTENT Fever, otherwise called Fever and Agne or Chills and Fever, like the two other forms of miasmatic fever distinguished by the names of Remittent Fever and Pernicious or Congestive Fever, most frequently occurs in the latter part of summer and autumn. Indeed, as original affections, they almost exclusively make their appearance at this season; for when they occur in winter and spring, it is generally as returns of former attacks.

Types.

Of intermittent fever there are three ordinary types: the quotidian, in which the paroxysm recurs every day with intervals of about twenty-four hours; the tertian, in which the paroxysm recurs on every other day, with an interval of about forty-eight hours; and the quartan, with the paroxysm on every third day, with an interval of seventy-two hours. The inventors of the two latter names followed the ancient method of counting the order of days, by including both the paroxysmal days in their nomenclature. Other types, which are very rarely seen, are quintan, septan, sextan and octan, the last occurring at intervals of a week.

The regular types are subject to numerous diversities. The quotidian is sometimes double, having two paroxysms every day; so is the tertian, with paroxysms every day, but at different hours or with different characters, so that two tertians are going on together. The triple tertian has two paroxysms every second day, and one on the intervening day; that is, three instead of one in forty-eight hours. In the double quartan, out of three days, two have each one paroxysm and the other none; and in the triple quartan, there is a paroxysm every day, but the three successive paroxysms differ from each other, while corresponding respectively with the three that follow. There are also a number of other complications, an account of which would probably confuse rather than instruct.

Symptoms.

In regular intermittent fever each paroxysm consists of three stages: the cold, the hot and the sweating, succeeding each other in this order. Very often the first attack is preceded by general lassitude and uneasiness, stretching, impaired appetite, and perhaps some pains in the head or back. These symptoms pass off without attracting much attention until their recurrence, with increasing severity, at regular intervals afterwards. Attention to these preliminary paroxysms is, however, important, as at this early stage the disease may often be promptly arrested by the adoption of proper measures.

THE COLD STAGE varies in duration from a few minutes to four hours or more, but averages an hour. During it, sensations of chilliness pervade the limbs and trunk, sometimes in longitudinal lines, like steamlets of cold water; rapid shudders run successively through the frame; the teeth chatter; the hands are shrunken; the features contracted and pale; the lips and ends of the fingers often purplish or livid. The body generally feels cold even to an observer, especially the hands, feet, nose, ears and cheeks; but sometimes, though the patient feels cold, the surface of his body is hotter than in health. The appetite is lost; vomiting often occurs; the breathing is irregular; the chest oppressed, and the pulse small.

THE HOT STAGE.—In the passage from the chill to the hot stage cold shiverings, technically called rigors, alternate for a time with flushes of heat. The warmth, at first agreeable, ere long becomes a universal burning heat. The cheeks are flushed, the eyes sparkle, the surface everywhere becomes red, dry and hot, nor is the increased heat confined to the sensations of the patient, for the thermometer shows that the temperature of the body is positively considerably higher. The mouth is hot and dry, the tongue usually furred; the thirst generally great; the pulse frequent, full and strong. The head usually suffers with a deep-seated, throbbing pain and a feeling of distension in the temples. This stage varies from two to eighteen hours or more.

SWEATING STAGE.—The perspiration, which is sometimes slight, but generally copious, and occasionally profuse, appears first on the face and breast, but gradually spreads over the whole surface. From its first appearance the patient begins to feel relief; the skin becomes cool; the headache disappears; the mouth is moistened; the kidneys resume their functions, and frequently the patient falls into a calm sleep, from which he awakes free from fever.

VARIATIONS.—The variations in the symptoms are too numerous to be particularized here. The average duration of the whole paroxysm may be set down as from ten to twelve hours in the quotidian; from eight to ten in the tertian; and from five to six in the quartan; the attack growing shorter as the disease becomes of longer continuance. When the paroxysm begins at once, without any preceding chill, it is commonly called dumb ague, to distinguish it from the common form which is called shaking ague. Sometimes each succeeding paroxysm occurs an hour or two earlier than the preceding; in other cases, an hour or two later. The former type is said to be anticipating, the latter retarding intermittent; and by this means one regular type may be converted into another, for instance the quotidian into the tertian or *vice versa*.

Intermissions.

As a rule, especially at the commencement, after the paroxysm has subsided, the patient has a general feeling of languor; pains in the back and sides; impaired appetite; uneasy sensations in the head; a sallow complexion, and a sickly look. These diminish with the continuance of the disease, and sometimes, even from the outset, the patient is as free from all signs of disease, during the intermission, as if in perfect health.

Course.

Paroxysms, as a rule, occur only during the day; and when in the anticipating or retarding cases, the time for the paroxysm reaches the hour of darkness, either it does not take place at all, or it sets back into the evening or leaps over until the following morning. The shorter the intermission, the earlier in the day, as a rule, does the paroxysm take place, and *vice versa*. If left to themselves, quotidians usually end spontaneously in about ten weeks; tertians in about four months; and quartans in six, seven or eight months. In mild cases, they terminate sooner; but sometimes, if not interrupted, they continue much longer. When checked by any means, all types, especially the quartan, have a strong tendency to return on little or no provocation, the quotidian commonly at the end of one week, the tertian of two, and the quartan of four. An attack in autumn is frequently followed by another at the opening of warm weather in the succeeding spring. The liability to recurrence usually continues for two or three years, even if removed from the cause, but the symptoms are successively milder. When it terminates fatally, it is generally either complicated with other diseases, or it takes a pernicious or congestive form. The special causes of the latter are still hardly known, but unless detected and properly treated in the early stage, it is too likely to prove speedily fatal. It differs so much, however, from the ordinary types, that it cannot be described here.

Effects.

If the fever be speedily checked, it will leave behind it no other disagreeable consequence than a disposition to return. But if allowed to run on indefinitely, or if continued exposure to its cause brings about frequent returns, among its probable effects are: an enlargement of the spleen, which when great is known as ague cake, an affection well known in many miasmatic districts; an enlargement and induration of the liver, giving rise to jaundice, dyspepsia, diarrhœa etc; chronic intermittent fever, accompanied with a sallow, dejected countenance, feeble appetite, languor and muscular weakness as well as many other disagreeable effects; intermittent dropsy, often obstinate and sometimes incurable, though always much less hopeless than when the disorder is due to independent disease of the intestines; and several other minor maladies. On the other hand it is occasionally useful in superseding neuralgic affections, epilepsy, asthma, rheumatism, and various cutaneous diseases

Prevention.

Avoid miasmatic regions, if possible, from early in June until frost. If this cannot be done, avoid morning and evening air and never sleep out at night. If out at these times, it should not be with an empty stomach or after fatigue or exhaustion of any kind. Shun scrupulous excesses of every sort: never remain long in wet clothes: when heated be careful about exposing yourself to cold; avoid, if possible, the intense heat of the sun about noonday, and keep the system steadily under the moderate influence of quinia.

From want of space here, "Treatment" must be deferred until next issue.

The Poultry Yard.

POULTRY BREEDING.—Continued.

HOW TO GET MOST EGGS.

THE manner of feeding poultry that are layers, is considerably different from that of feeding those that are breeders. In the latter case we want eggs that will hatch chickens with a strong constitution and good qualities; while in the former case we want eggs, and only eggs; we care not whether they will hatch or not, our only aim is to get the greatest number of eggs from our fowls.

In order to accomplish this end, we keep only pullets of last year's hatch and feed all they will eat of rich food constantly growing richer. If they flag, we give a stimulant to impart to them a fresh start—red pepper is the cheapest and perhaps the best thing for the purpose. Fowls will continue to lay well the second year, but it will not be found as profitable to feed them through their molting season as it would be to keep them "laying their best" for one year and then kill them. Another thing: if you only keep them one year, you will have no "tough fowls" to haunt your dreams.

KILLING YOUNG HENS.

Young hens may be killed two weeks after ceasing to lay, and, if well handled, they will be fat and may be thrown on the market at an advance of from one to five cents per pound above common "choice lots," if they happen to be Brahmas. Many will, perhaps, object to this hot-house system as being detrimental to the constitution, but as we set no eggs from these fowls, the objection has no valid foundation, and falls through. Do men object to forcing steers, by high feeding, into rapid fattening on the plea that it is injurious to the constitution of others which are not so fed?

FOWLS CAN'T BE TOO FAT TO LAY.

There is one point to be remembered: it takes a certain amount of food to keep the animal alive, and after that all the food eaten *must* go either to make eggs, to build the body, or to produce fat. It is nonsense to talk of pullets being "too fat to lay." With old hens it *may be* possible, but I have never had this happen to any of mine, nor have I known of any one else that had a fowl so affected, although a friend of mine keeps a hopper of corn always before his fowls, and from October till March, in addition to this, gives, night and morning, a feed of boiled corn-meal, and yet his fowls lay extremely well.

Some time ago I gave the results of some experiments with pigs, which showed that it took fifty pounds of corn-meal to keep a hog one month, and that one hundred pounds of meal per month produced a gain of about twenty pounds; that is, fifty pounds went to supply the waste of the system and all above that went to increasing weight. In cows, a pair consuming a small quantity produced five quarts of milk for every 100 pounds of green Lucern eaten, while a pair consuming a larger quantity, produced six quarts of milk for every 100 pounds of lucern they eat. The same will be found to be the case with fowls—"the fowl that eats most will give the most profit," as a rule, though, of course, there will be exceptions, but not many.

EXERCISE AND FOOD FOR LAYERS.

Make your layers take exercise, not as much as the breeders, but still enough to ward off disease. One-half the feed for my layers is ground. The natural mill of a fowl's gizzard is capable of grinding all sorts of grain; but, though it is involuntary, it is at too great an expense of muscular force. All the ground feed is cooked. I should cook all, only the part raw is preferred by the fowls and they need it to keep them busy. The cooked food is placed in a trough, with slats over the top, to prevent the fowls from scratching it out and dirtying it. The unground, raw grain is so placed that the hens must scratch in order to get it. This is accomplished by burying it slightly in the ground in the summer, and in a pile of chaff or cut straw on the floor of the poultry-house in the winter.

The fowls should also be supplied with some vegetable and flesh food every day, winter and summer. The best way to get this is in the winter to feed turnips and potatoes; and in the summer cabbage leaves, tops of vegetables, weeds, etc, etc., will furnish what you want in this line. For flesh, butchers' waste is my staple, but I often get worthless fish which are both cheap and for this purpose good. Anything that is animal food will do, and where any one has but a few fowls and can get skim-milk, he need look no further. A. M. VAN AUKEN.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY AUG 10, 1878.

We offered, some time ago, to sell the cuts used in this Journal for ten cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

TO OUR SUBSCRIBERS.

For our seed distribution last fall, we did suppose that we had raised a sufficient quantity of seeds to supply the probable demand. The supposition was a great mistake. We were obliged to buy seeds—the best we could obtain—to fill our orders. As the varieties originally offered were not procurable, there was no other alternative but to obtain the best we could. Hence it was that at least half of our friends, though receiving the *number* of packets announced, were disappointed in the varieties.

It is our intention to offer our subscribers the present season (on or before Nov. 1st) garden and field seeds, as well as flower seeds, and for the most part those which cannot be procured elsewhere, and there can now be little doubt that our supply will suffice for all demands. Five of the kinds to be offered originated on the Rural Grounds from cross-breeding, and the others are such as, with one or two exceptions, we have never seen offered for sale in any catalogue.

It will be observed that these seeds are to be offered in the latter part of the year to old subscribers, and not, as has often been suggested to us, as a premium, or for the purpose of attracting new ones. Indirectly, no doubt, if of any real value, they will tend to do so. But the plan is only one of many we are striving to carry out in order to be worthy of what we greatly desire to merit, the confidence and respect of our readers.

As we have before stated, we are obliged to limit these seed distributions absolutely to subscribers whose names are upon our books. Many have written to us, claiming that they were entitled to seeds, inasmuch as they purchased the RURAL NEW-YORKER of the news' dealers. For good reasons, however, which need not to be defined, we must take the liberty of disregarding such applications in the future.

We have now a word to say to our lady readers. For five years past we have been collecting what we judge to be the best Pelargoniums (Geraniums), in cultivation, both single and double. We have roughly estimated that by, or before, the first of October we shall be able to send a few cuttings to those who wish them. In a few weeks, probably by the middle of next month, we shall give a list of the names, from which our lady readers may take their choice.

MINOR MORALS.

We have often noticed how, at the announcement of every theft or defalcation in our larger cities, suburban and country papers eagerly seize the opportunity to inveigh, with holy horror, against the wickedness and depravity therein existing, and talk as if all morality and common honesty had fled therefrom and taken up their abode among the fields and forests of the country. That there has been, during the few years past, in our principal business centers, enough wrong-doing to attract the attention and excite the fears of all thoughtful men, is too true. That sin and wickedness more abound at the present than at any previous time, is doubtful. There are probably no writings extant that more clearly and truthfully show what human nature was, in the olden times, than the Proverbs of Solomon; and they need no change in order to make them applicable to the same human nature at present. That the centers of business attract from the country a large proportion of its enterprise and energy, is true; and that these talents are not always directed in the best channels, is also indisputable. Large cities are also the recipients of all immigrants. Of these it is only the more industrious who find their way to country homes, leaving the vile and dishonest to lower the standard of morality, which would be low enough without them.

We do not propose to take up the cudgel in defence of the morality of the city, not even to say to the country, in slang phraseology, "You're another." We would, however, suggest the impropriety of one culinary utensil reflecting on the complexion of its neighbor, for usually the pot is as black as the kettle. All immorality and dishonesty are not connected with energy and enterprise, and when these latter find their way to cities, the former, or some portions thereof, are left behind.

The enormity of a crime is often judged by the amount of dollars involved,—but a theft is a theft be it of one dollar or a million,—and he who steals the one is just as far as, and no farther, from being an honest man than is the other. The country was startled a few years ago by the revelations showing how the Tweed ring had misgoverned New York and misapplied the public funds. We believe we have within our knowledge small townships that have been managed with as little regard to the public good and with as much dishonesty in the application of public money, when the amounts are considered, as was New York in its worst days. And the same will hold good as regards manufacturing companies, corporations and individuals.

In cities a police force is sustained at large expense for the protection of property. In the country, a farmer is obliged to build and maintain fences to prevent his neighbor from stealing his crops—by means of cattle—at an expense greater than would be believed, without actual mathematical calculation.

If we were endeavoring to make a case against our country friends, it would be easy to remind them of a multitude of cases where the narrow path of morality is often overstepped. When have we seen a barrel of apples or potatoes that had as good fruit in the middle or bottom as on the top? Will the hoops about the bales of hay be as heavy when a pound of wood is worth more than a pound of hay—or will eggs average larger when they are sold by weight instead of number?

Little sins, so called, are often winked at, and there are many who would do you out of a dime to whom a dollar would be a stumbling block, and the stealing of a thousand dollars would seem an enormity at which the very gates of perdition would open. The temptations for wrong doing are greater in the city than in the country. Expensive habits of dress and living, indulged in by those who have money to spare, beget a want for the same things in those of limited incomes, to satisfy which, sense of right is put aside and sin committed, and while the prayer, "Lead us not into temptation," should be on every lip, it seems more necessary for him of city life and influences. But the power of resistance should grow in pace with surroundings, and we make no excuse for the sinner on this ground. When Adam eat the apple, his punishment was none the less because Eve gave it to him, nor her's because she was tempted by the serpent. As a man thinketh, so is he. If covetousness, deceitfulness, untruthfulness, avariciousness, have place in a man's heart, and he allows them to so gain ascendency over his uprightness and honesty, even in trifles where opportunities are limited as in the country, what shall prevent his allowing them full sweep when a city life puts him in position to gratify them? Nothing but an awakened sense of right and justice, which sometimes comes to save him. If temptations are strong in the city, so is virtue. Innocence thrives best in the country, but virtue in town. The depravity of a man in a quiet situation burns with a smoldering fire: put him amid the oxygen of an active life and it burns with a consuming flame. Who among us dare pray, "Lord, I thank thee I am not as other men?"

DAIRYING WITH GARDENING.

The drift of the American people is strongly towards cities and villages, and this, no doubt, arises to satisfy a desire for closer social relations. More than half of the population of the most populous States live in cities and villages, and are non-producers of food. This makes a large demand for the productions of market gardens, and these market gardens must be kept in a high state of fertility to produce remunerative crops. Contiguous to large cities manures may be obtained from city stables, but this is all absorbed by a small proportion of the gardeners, and the much greater number must depend upon other sources for fertilizers. Stable manures are so bulky that the cost of handling them more than five to eight miles renders them unprofitable. We have known gardeners to expend more in hauling manures fifteen miles from the city than the same manures could have been produced for at the garden. These city manures cost, delivered eight miles, not less than six dollars per cord. The same fertilizing material can be made at the garden from cows and pigs for less money. If we suppose (which is not too high) that a cow will make five cords of as good manure per year, this part of her product would be worth $30. A judicious selection of cows and proper feeding will give a small profit on the cost of labor and keeping in the production of milk, and the manure might be considered a sufficient profit.

We are aware that the gardener will have many objections to dairying for the supply of the manure required. He will be apt to object, first, that the extra labor will be too great to add to his gardening. But a large part of this extra labor may be performed by the men required to drive his teams to the city for manure. The labor that hauls his manure from the city will nearly suffice to care for and milk the cows. This labor occurs at stated times each day, and the balance of the time this help may be used in gardening labor. He will not require the labor of his expert hands in gardening for the dairy. The work of the dairy is separate occupation, and he will find these assistants outside the gardening class. Dairy products are always cash and will meet the expenses of this part of his business.

Another objection will be, that he has not land enough to afford room for cows—no pasture, etc. It is quite true that most gardeners have no room for pasturing cows, and the true system of manure-making for gardening will not admit of pasturing. His object is to produce manure and keep it within reach for use, and he does not want it scattered over the pasture. He must keep as many cows as space will permit. Pasturing does not belong to his system. The soiling system is here precisely his trump card. This does not require improper confinement of cows. A yard with abundance of pure water, where his cows may exercise and take the air, is all that is required on that point; they will be fed in stable with green food in summer. He should keep not less than two cows for each acre actually in garden crop. Let us see how completely soiling comes to his aid. Every gardener knows the advantage of rest for the land in these exhausting crops, and what new vigor is infused into it by seeding to clover for a year or two—and on this account, not more than one-third to one-half is cultivated each year in garden crops. This land, taking a short rest, will raise fine crops of clover and other grasses, with annual crops to come between cuttings, and furnish all the green food required, besides a large portion of the winter fodder.

Then note how the gardener may save everything he raises and turn it to good account. Peas sown for market will make excellent soiling food after the last picking. Green pea vines make good milk. Refuse cabbages, carrot and beet tops all turn to cash in the dairy. A large amount of such green food is furnished by a garden. But as the object of the gardener will be manure, he will not confine himself merely to feeding what grows on his own land, but will buy freely what he can feed with a profit. He will desire not only that his cows shall produce largely, but that the manure shall be of the best quality. He will therefore feed grain liberally, as he may well afford it, for it will be repaid every night in milk. Corn-meal, oat-meal, pea-meal, and middlings of wheat will be fully paid for in butter at twenty-five cents or cheese at ten cents.

The Native Flowers and Ferns of the United States.—We call attention to our remarks respecting this worthy work, in the RURAL NEW YORKER of June 8, p. 364. It was at first proposed to make one series of two volumes as a trial and to issue successive series if the public seemed to value it. We are happy to know that the public do value it, and that the publishers (L. PRANG & Co., Boston,) have been encouraged to go on with another series.

BREVITIES.

DIOSCOREA BATATAS is now in bloom. The air about it is redolent of the odor of cinnamon.

A DUTCH paper states that the flavor of coffee may be greatly improved and its delicate aroma increased by adding a little bi-carbonate of soda to the water with which it is made.

SEC'Y GARFIELD, from his observations during a late Eastern trip, is satisfied that "as farms run in Western N. Y. they are not so well managed as those in Southern Michigan."

NOTHING is more true than that many men of great natural abilities pass their lives in obscurity for the reason that they love the pursuit of knowledge more than they do the praise of the world.

IN the American Naturalist for August is an article by Professor W. J. BEAL, of the Michigan Agricultural College, upon the fertilization of Utricularia and Pyxidanthera. The special contrivance by which it is shown that insects are needed for this work is well portrayed by well-executed engravings.

DR. HOSKINS says: "Either a typographical or chirographical error (probably the latter, as I find I am very prone to "heterophemy," thinking one thing and saying or writing another,) caused my article on Dairying Fallacies in RURAL of June 29th, to say "chemical and *physical*," where I meant "chemical and *optical*." Chemistry was a branch of physics when I went to school, and probably still remains so.

MR. E. P. ROE, the enterprising small-fruit cultivator of Cornwall-on-the-Hudson replied to queries of ours, during a brief call a few days since, as follows: "The Thwack Raspberry is a weed on account of its persistent suckering habit"—"Cow manure is of all manures the best for the Strawberry"—"The Great American Strawberry is *great* only in particular localities and under the highest culture."

OUR horticulturally inexperienced friends are reminded that the budding season is at hand. They may refer to the R. N. Y. of July 28, last year, for particulars. We think, however, that for those who are possessed of a pinch of dexterity, the following abridgment may answer: We'll take a rose. Cut in the bark of the stem two slits forming a T in outline. Then cut off a bud from another variety with enough of the bark to form a shield half an inch long, and insert this shield in the perpendicular part of the T. Bind it with yarn or bass.

IN the exquisite poem by Mr. SAMUEL B. PARSONS, The Music of the Trees, published in the RURAL of July 27, the third line (verse) of the first stanza was omitted. The stanza should have read:

There's music in the wild wind's roar,
And in the thunder's crash;
There's music on the rippled shore,
And in the waves that dash,
With crested beauty, on the brow
Of rocks all hoar and mossed.
Singing their melancholy dirge
For the ever loved and lost.

PROF. LAZENBY, in an account of his garden experiments at Cornell University, published in The Husbandman, rates Philadelphia Extra Early peas as of "good" quality, placing them on a par with McLean's Little Gem which is generally admitted to be one of the sweetest peas in cultivation. Philadelphia is no doubt for most localities the earliest. In our experiments with twenty-seven varieties, we found it two days ahead. But to our taste it was of the poorest quality. It is in fact so insipid that we would prefer to go without peas a few days for Laxton's Alpha.

Since writing the above we read under "Notes from the Pines" (Am. Ag.): "Seedsmen make a point of five days in the earliness of peas, but I had rather wait twice five days and get peas like the Kentish Invicta than to bother with such flavorless things as the Daniel O'Rourke." In the article above referred to (RURAL of Sept. 15) is the following: "Kentish Invicta. First picking June 14. Narrow flat pods averaging four peas. Uniform size, well filled, bluish green color. The flavor is no better than that of the whiter varieties. June 25, all gone." From all of which we may conclude that it is hard to settle upon any one variety of fruit or vegetable to suit all tastes alike.

Literary Miscellany.

MOSS-ROSES.

WHITE with the whiteness of the snow,
Pink with the faintest rosy glow,
They blossom on their sprays;
They glad the borders with their bloom,
And sweeten with their rich perfume
The mossy garden ways.

The dew that from their brimming leaves
Drips down, the mignonette receives,
And sweeter grows thereby;
The tall June lilies stand anear,
In raiment white and gold, and here
The purple pansies lie.

Warm sunshine glitters over all,
On daisied sward and ivied wall,
On lily, pansy, rose;
While flitting round each garden bed,
With joyous laugh and airy tread,
A fairer sunbeam goes.

A little human blossom, bright
With childish, innocent delight
Of life yet in its dawn;
With sunshine prisoned in her hair,
Deep eyes unshadowed by a care,
She gambols on the lawn.

She checks the light elastic tread,
And stays to hear, far overhead,
The lark's song to its close;
Eyes shaded by two tiny hands—
We pray God bless her as she stands,
Our little daughter Rose.

Yea, bless the Rose, dear God, since we
Have given the Lily back to thee,
That bloomed with her awhile;
Yea, bless her deeply, doubly now,
For her dear sake, whose angel brow,
Reflects thine awful smile.

How often in her childish face,
Our hungry, longing eyes can trace
The looks of one away;
How often in her merry tone
A music wakes, more sad than moan,
Of accents hushed for aye!

God bless the child to blossom here,
Our clinging human hearts to cheer,
Till life has reached its close;
To grow in sweetest grace and bloom,
To beautify the dear old home,
Our precious daughter Rose!

[All the Year Roun

DOROTHY'S RIVAL.

BABINGTON WHITE.

IN the days when the thunder of Whitfield's voice had but newly resounded above the crowd at Moorfield's, Mr. William Bolton, a simple country parson of the Established Church, lived very happily with his only daughter, Dorothy, on the outskirts of Hammersley.

The parsonage was a comfortable red-brick house, very square and very uninteresting from a picturesque point of view. It stood a little way back from the high coach-road to London, with an orchard on one side, and on the other a common cottage-garden, with two long flower-beds and a broad gravel-path, and vegetables growing in the mild distance, and espaliers in the background. All the roads were London roads in those days; and people lived on the London road without ever seeing the metropolis, which figured, glorious and radiant, in their day-dreams; an enchanted city—not actually paved with gold, but altogether marvelous and beautiful.

To Dorothy Bolton the red house, the orchard, and the garden were very pleasant and dear. What, indeed, could be more beautiful than the parlor, with its two prim book-cases, the needlework pictures of a shepherd and shepherdess smirking from their oval frame; the little room in which her father composed his sermons, with much aid from grim-looking black-leather-bound books, labeled Barrow and Tillotson; the infallible eight-day clock in the hall, which groaned and rattled in such an awful manner before the striking of an hour, and above the dial of which there was something scientific in the way of a sun and moon that were never quite in working order. All these things to the eyes of Miss Dorothy were beautiful; nor did she pine for any brighter or gayer existence than that which she enjoyed, or languish for any respite from the many duties of her simple life. She had no higher aspiration than to sit in the parlor wearing out her bright young eyes in the fine stitching of her father's shirts, to help her mother at bread-making, or to trudge into Hammersley on a fine morning by the parson's side, to share in his round of visits among the poor folks, or to read that new and delightful story of Pamela aloud to her father and mother in the long winter evenings. These things were at once her duties and her pleasures. In this peaceful home she had grown from childhood to womanhood, and was so innocent and childlike still, that she thought it was her gipsy hat and scarlet ribbon that made such a picture of brightness and beauty in the little mirror that reflected her fair young face every Sunday morning while the bells were ringing for church. Yes, Miss Dorothy Bolton—or Mrs. Dorothy, as people were more apt to call a damsel in those days—had grown from a sunburnt, hoydenish girl into a very lovely young woman, without any consciousness of the transformation. The parson and his wife saw that their only child was now, indeed, a comely young person; but these good people would have cut their tongues out rather than they would have confessed as much to the damsel herself.

"Handsome is who handsome does," said Dorothy's mother; and the girl felt as if her good looks were in some manner dependent on the neatness of her stitching and the lightness of her last batch of bread.

By and by, however, there came to Hammersley Parsonage some one who, although by no means prone to dilate upon Dorothy's personal attractions, permitted the young lady to discover her power to charm. The new-comer was a certain Matthew Wall, a young clergyman, who came to share the burden of the vicar's duty, and who had so far proved himself a very worthy and efficient member of the Church.

Indeed, in sober truth, efficiency and energy were much needed for the cure of souls in Hammersley. The town was large and crowded, the people rough and disorderly; and an awakening voice was needed to arouse a people who had long been dead to the spirit and careless as to the letter of the faith.

William Bolton, the vicar, had a simple mind and a kindly nature; but something more than these are required for the salvation of such a town as Hammersley; and this something more seemed to have been given to the poor benighted creatures in the person of Matthew Wall.

The vicar preached a very orthodox sermon of the soporific school, and had a heart and hand ever open to the appeal of the poor; but, as his means were small and his judgment very fallible, he effected with the best intentions, very little real good. He was getting old; and he liked his after-dinner pipe in the orchard in summer, and by the chimney corner in winter. He liked to take his nap in the long winter evenings, while Dorothy read The Life and Surprising Adventures of Robinson Crusoe, or Religious Courtship, or an odd number of the Spectator. He visited his poor from time to time, and he was not unwelcome to them even when he came empty-handed; but it seemed as if his visits did very little good. Hammersley was, in truth, too big a place for this simple pastor, and the people of Hammersley too rugged a race for his mild rule.

Matthew Wall was a very different pastor. Fatigue and discouragement were alike unknown to him. He had the energy of a Whitfield or a Wesley; and, in that day, Whitfields and Wesleys were needed in the Church as well as out of it.

William Bolton invited his curate to dinner on Sundays; a dinner served directly after service—substantial and ponderous, after the old fashion. But Mr. Wall would eat very little between the services; he did better justice to the nine o'clock supper. The vicar, who exhibited a hearty appetite both at dinner and supper, called Matthew a poor trencherman. It is possible that Matthew's chief delight at the parsonage was not to be found in his trencher. He sat by Dorothy at supper, and seemed to derive much satisfaction from her society. He found her sweet-tempered and modest as Pamela, pious as Dorcas; and before he had been six months at Hammersley he made a formal demand for her hand.

The vicar hummed and hawed, and consulted his wife.

"Sure, 'twould be but a poor match for her," he said. "Matt Wall has but his cure of seventy pounds a year, and a few hundreds to come from his father by and by. The rogue has good parts, I dare say, and has done good service amongst Hammersley folk with his fiery talk and hunting them out in their dens; which is pushing a parson's trade farther than I should care to push it. I doubt but he's touched with the Wesley and Whitfield madness; and we shall have him turning his coat some day, as the two Wesleys did—to the shame of his family and friends."

Happily for Matthew Wall, the vicar, after consulting his wife, thought fit to say a few words to his daughter.

The girl reddened and cast down her eyes, and when hard pushed by her father's questions, confessed with tears that she loved Matthew very dearly, and would go to her grave unmarried sooner than she would give her hand to any but him. The vicar was no 'Squire Western. He expressed his astonishment by a long whistle, and reproved his daughter for a sly puss; after which feeble protest he consented to receive Matthew Wall as his future son-in-law. But there was to be no marriage for three years to come. Matthew was but five-and twenty, Dorothy just turned eighteen. The young couple pledged themselves very readily. They met on Sundays, walked to and fro together between the parsonage and the church, dined and supped together; and whenever Matthew's business happened to bring him near the garden-gate on week-days, he would step in to say a few words to his Dorothy.

The three years passed very pleasantly. Matthew Wall had become a power in Hammersley before his period of probation was ended. There were some who called him wild and fanatic,—for to be earnest in those luke-warm days seemed a kind of fanaticism; but since in many instances the drunken became sober, and the reprobate became decent beneath his sway, folks were fain to admire his earnestness. The bishop of the diocese complimented the young man on the change he had brought about in Hammersley.

"I'm pleased you should show these folk that 'tis possible to do good without deserting the Church we have sworn to hold by, sir, and that 'tis as easy to bring the stray sheep back to the true fold as to lure them into a strange one," said the bishop, at a grand ceremonial luncheon of which he deigned to partake on a certain occasion.

Parson Bolton was gratified that his curate and future son-in-law should win this meed of praise from episcopal lips.

"But there's more of the Methody about our Matt than I quite relish, for all that," he said to his wife in the confidence of connubial discourse. "It is not given to mortal man—least of all to a religious reformer—to please everyone. There were people in Hammersley who did not like Matthew Wall. His long, earnest, even fervid discourses displeased a few. He had refused invitations to tea and supper-parties—solemn and yet boisterous festivities given by the richer tradesfolk of Hammersley—and had thus offended many. There were Wallites and anti-Wallites in Hammersley; and the anti-Wallites were strong. Amongst them the most notable people were a certain Mr. Jorboys, grocer and cheesemonger, his wife, and daughters. The Misses Jorboys—Sally and Letty—were accounted beauties. They wore hats and muffs and gowns, which their father brought from London when he went thither for colonial produce; and they took it ill of Mr. Wall that he had been so prompt to devote himself to the parson's dowdy daughter, who had never known what it was to powder her hair, or sail along the High-street prim and stately in pannier-hoops.

It was nigh upon Christmas, and there was to be much joviality at the parsonage, for this must be Dorothy's last Christmas at home. A neat little house in Hammersly had been hired by the curate, and comfortably furnished out of funds provided by his father, with certain additions in the way of dragon-china tea-service, a brass-handled bureau, and liberal store of home-spun linen, provided by Mrs. Bolton, who with her own hands prepared the nest for these young turtle-doves.

"I could have wished my Dorothy had fancied Squire Hever, of Hever Farm, who was like to die for her last winter," the parson's wife said to her gossips; "but she's been like one bewitched since Matthew courted her. 'Sure, would you have me break my faith with a saint, dear madam?' she cried, when I told her how young Hever would have made a lady of her, with her own coach and a black footboy. And I do think the simpleton's right in that," Mrs. Bolton would add with an air of conviction. "I've seen young men more mannerly in turning a compliment, and softer spoken; but if ever there was a saint on earth since St. Paul, I think Matthew Wall is one."

Of late the lady's gossips had been somewhat slow to respond to this observation; and she was not a little vexed on one occasion by the conduct of her particular friend Mrs. Jorboys, who went so far as to shake her head and groan audibly at this point in the conversation.

"I hope you have nothing to say against my daughter's sweetheart, ma'am?" the parson's wife observed with some acidity.

"O no, ma'am," Mrs. Jorboys replied with a sigh more dismal than the last; "I have nothing to *say* against him."

There was an unpleasant emphasis on the word *say* that went nigh to freeze Mrs. Bolton's marrow.

"I don't quite take your meaning, ma'am," she said stiffly. "Mathew Wall may not be a rich husband for our Dorothy, but he don't need to be groaned over as if he were a beggar."

"You wasn't talking of beggars, as I know of, ma'am," Mrs. Jorboys answered with acrimony. "You was talking of saints."

"And what then, ma'am?"

"I have my thoughts, ma'am. I should be vastly sorry to hurt your feelings, Mrs. Bolton, but my thoughts are not my own making, and I can't help it if they are of a nature to lead to what you was so civil as to call groaning;" and hereupon Mrs. Jorboys sighed again, while Miss Letty and Miss Sally sighed in chorus. This occurred at a Hammersley tea-party, from which Dorothy chanced to be absent.

The parson's wife went home perplexed and miserable. The next batch of bread was heavy and by no fault of Dorothy's, though her simple head was a little distraught by thinking of the great change so near at hand. It was the chief bread-maker whose mind was most troubled, whose hand was most uncertain. Those groanings and head-shakings of Mrs. Jorboys haunted the good soul by day and night, and Dorothy could but wonder what made her mother so thoughtful.

"I fear there's something troubles you, ma'am," the girl said, in the petty, respectful manner of those days.

"Nay, my dear, I have no trouble but the thought of losing thee," answered the mother; "and if it's for thy good, I'm content we should part."

"But it's not parting, dear madam; 'tis but living in separate houses. Do you think there's a week will pass without my paying my duty to you? And I'll come to help with the bread-making, if you'll suffer me."

This was Christmas-eve. There was to be fine fun at the parsonage that evening, ending with the compounding of a beverage, made of eggs and spices and ale, that had been compounded at a certain hour on every Christmas-eve since the vicar had kept house. The beverage was always compounded in the parlor, and partaken of with all solemnity out of a great silver tankard that was said to have belonged to Oliver Cromwell. Dorothy vowed that it was but a battered old thing, and she had seen finer, spick-and-span new, at a silversmith's in the High-street.

The curate was to drink tea at the parsonage, and assist, not only in the compounding of the beverage, but in the composition of that much more sacred mixture, the Christmas pudding. To these simple diversions Dorothy looked forward with extreme pleasure. She thought of her betrothed with unmeasured tenderness, with reverence and devotion, amounting almost to fanaticism. She believed in him as a being almost too saintly for earth. Mrs. Bolton had ample occupation for her hands

MOSS-ROSES.

on this eve of the great Christmas festival; but her mind was not free to devote itself to her labors. The image of Mrs. Jorboys pursued her through all her duties.

"I'm very like to want more raisins and spices for the pudding between this and the New Year," she said to herself; "I'll walk to Hammersley this afternoon, and have it out with Mrs. Jorboys."

Having once resolved on this course, the matron was more at ease. She set out on her expedition directly after dinner, leaving the vicar smoking his pipe by the chimney-corner, and Dorothy busy with her plain sewing. The girl had offered to accompany her mother, but the offer had been refused. The dame departed in very good spirits, promising to return by tea-time. Dorothy sat sewing while her father smoked and dozed, and dozed and smoked; and at five o'clock in came the curate, tired with a day's hard work, but cheered by his Dorothy's welcome and well pleased to find himself seated by her side.

"I've come all the way from Liscott Common," he said, as he seated himself in the old-fashioned arm-chair which Dorothy had set ready to receive him; "and it's a long trudge."

It was five o'clock, and Dorothy had brewed the tea, which was an infusion to be partaken of with a certain ceremony in those days, as an expensive luxury implying refined taste and much gentility on the part of the consumer. Parson Bolton took no tea—but the curate liked all that Dorothy liked. The pretty little china teacups—fragile little things, without handles, like a child's toy cups and saucers—and the quaint little teapot were set out on the polished mahogany board, but there were no signs of Mrs. Bolton's return. So the lovers sat talking together in undertones while the father dozed for one brief happy hour, and then, after the usual preliminary groaning, the infallible eight-day clock struck six.

"I should be quite frightened about mother," said Dorothy, "if I did'nt know that Jorboys' man is to come home behind her with the parcels."

She had scarcely spoken when the door was opened, and shut again with a slamming noise, and Mrs. Bolton stalked into the room.

The matron's cheeks were crimson, and the matron's eyes flashed fire. Never before had Dorothy seen such a look in her mother's face.

"You're late home, madam," she said, trembling, she scarcely knew why, unless it were because of the strange look in her mother's face.

"Thanks be to God that I'm not too late," the parson's wife answered solemnly. The unfamiliar tone of her voice startled her husband from his comfortable doze, and he looked up alarmed, crying, "What, what?" like his revered sovereign King George in after-days.

"Sit down and drink thy tea, lass," said the good-natured parson, as his wife stood tugging at the string of her cloak, hindered by Dorothy, who made believe to assist with trembling fingers.

"Never, while that bad man is under this roof," answered the dame, pointing to Matthew Wall, who had risen to receive her.

"Bad man!" cried the parson; "art thou dreaming? There's no one here but Matthew Wall, thy son-in-law that is to be."

"My son-in-law that never shall be: I would see my daughter in her winding-sheet first."

"Why, what maggot has bitten thee, wife?"

"May I ask the meaning of this strange talk, madam?" asked the curate, with that awful calmness peculiar to a proud man who feels himself outraged.

"Thou mayst ask and shalt be told, too, as plain as I can speak before this simple, tender soul that loves thee," answered the matron. "I wonder thou art not ashamed to come to an honest man's house and steal his daughter's heart—you, that play saint on Sundays, and sinner on Mondays, and hypocrite all the week round."

"Mother!" cried the girl,—indignation, astonishment, anguish, reproach, all expressed in that piteous cry.

"I must ask for the second time what you are pleased to mean, madam?" said Matthew Wall with unshaken calmness.

"I'll answer that question with another, sir," returned the matron. "Will you be so good as to tell me—here, before my husband and daughter—whether you know Liscott Common?"

There was nothing very awful in the question itself, but Mrs. Bolton's tone made it awful, and it went like a pistol-shot through Dorothy's heart, as she remembered how her lover had talked of his walk from Liscott Common that very afternoon.

"Yes, Mrs. Bolton, I know Liscott Common."

"So, sir, you don't deny your wickedness?" cried the dame; "but perhaps you will deny your knowledge of Jane Gurd's cottage on the other side of the common, where you've been seen to go twice, three times, four times a week for this last six months; and where you've been known to stay two hours at a spell, times and often—you, that complain of wanting leisure for good works! You could find leisure for bad works, and to spare, I reckon. What, you start and change color at last, my fine master! I doubt you did not think Hammersley folks were sharp enough to find out your doings."

"I did not think Hammersley folks were so wicked as to impute evil to a man who, when most unworthy, is at least urgent in his duty."

"Upon my word, sir," exclaimed the infuriate matron, pushing aside the trembling girl, who would fain have restrained her wrath, "you carry matters with a bold front; and I must needs speak plainer than I care to speak before this simple child here, who was too quick to love and trust you against her parents' will that had higher hopes for her. Nay, dry thy tears, Dolly; I'll see thee mistress of Haver Grange, belike, instead of drudge and draggletail for love of that dirt yonder."

And the matron pointed at Matthew Wall with a trembling finger,—at Matthew, whose calmness was not yet shaken.

"Will it please you to speak quietly and civilly, madam?" he said. "You ask me if I know Liscott Common, and I answer yes; if I know Jane Gurd's cottage, and I answer yes again. I came straight from there to this house an hour ago."

"You came from there to my child!" shrieked Mrs. Bolton; "then, indeed, you are a shameless villain!"

"Come, come, dame," expostulated the parson; "civil words! civil words!"

"'Tis easy talking for you, William; but am I to pick and choose my words, when my heart is like to burst for grief and shame? That wretch yonder, that was to be married to our Dorothy a fortnight come Saturday—him that pretends to be a saint—must needs have his fancy. He keeps a fine madam hid away in Jane Gurd's cottage, and there's scarce a day passes that he does not waste a couple of hours in paying his duty to the lady; and he comes straight from that woman to my daughter; and you ask me to keep my patience, William Bolton!"

"I'll not believe it!" cried Dorothy suddenly, flinging herself away from her mother, and standing bolt upright, looking at the dame with flaming eyes. "I'll not believe it, mother, if all the people in Hammersley were to swear it on their Bibles."

"There is no need for so much warmth, Dorothy," the curate said gently. "I do not fear thou wilt believe ill of thy chosen husband. And you, madam, will soon be sorry for having done me so much wrong. Pray, who was it told you this pretty story?"

"I heard it from Mrs. Jorboys; but 'tis the common talk of Hammersley."

"I am sorry Hammersley should choose such vile discourse."

"Can you deny this story?"

"I will not trouble myself to deny it."

"O, indeed, Mr. Brazenface! You won't deny, then, that there is a young woman living in Jane Gurd's cottage, and that you took her there?"

"That is quite true."

"And is it true that you have paid for the vermin's board and lodging?"

"Vermin is a very hard word, Mrs. Bolton, and the girl at Jane Gurd's cottage deserves no such bad name. I have paid for her meat and drink hitherto: Jane is kind enough to give her shelter without recompense."

"And you took her there?"

"Yes, I took her there."

"You are a bad man, Matthew Wall."

"I thought you were too good a woman to be so ready to think ill, or to listen to gossip that is as idle as it is wicked," answered the curate with the gentle gravity that had distinguished his manner throughout this interview.

"If there is no harm in your doings, why have you kept them secret?" asked the dame with no less anger, but with a certain admixture of uncertainty.

"I can but answer you with Shylock, it has been 'my humor.' There are things a man does not care to talk about. I have had my fancy about that poor girl at Liscott Common. The fancy might have proved a foolish one, and I might have been laughed at for my pains."

"And this is all you have to say?"

"Yes; I will say no more to-night. If you want to know more, Mrs. Bolton, or if you would know more, Dorothy dear, you have but to walk to Liscott Common with me after service to-morrow, and you may find out more of poor Betty than you can learn by Hammersley's gossip."

"Betty!" exclaimed the matron, "Betty what, pray, sir?"

"She has no other name," replied Matthew; "she had one when I first met with her; but I have done my best to rid her of it. And now I will wish you good night, madam, and a heart less prone to give heed to slander. Sure, I know 'tis a kind one."

He took Dorothy's hand as he passed her, and pressed it tenderly to his lips.

"Thou art too pure to doubt me, dear creature," he murmured. "I will show thy kinsfolk to-morrow that thy purity is wiser than their experience."

In the next moment he was gone. The parson's wife sent Dorothy to bed—for in the days of Pamela and Clarissa it was within the scope of maternal authority to send a daughter of twenty-one years of age to bed—and immediately sat down and began to cry. She had her cry out, and then consented to answer her bewildered husband's inquiries. She told him how her suspicions had been aroused by certain hints and head-shakings on the part of Mrs. Jorboys, and how she had gone that afternoon to Hammersley determined to have it out with that lady; and how Mrs. Jorboys had told her with due solemnity that Matthew Wall's wickedness was the common talk of Hammersley, since he was known to have a mistress, some low common rubbish picked out of a Hammersley gutter, hidden away in Jane Gurd's cottage; and how his frequent visits to Mrs. Gurd's abode had in the first place aroused suspicion, after which he had been watched by good and zealous Christians anxious for the repute of their holy Church.

"But how do these spies and watchers know that the girl is Matthew's mistress?" asked the parson.

"What else should she be, William?" exclaimed the dame, with an awful shake of the head.

There was no compounding of spiced drink on this Christmas eve. The parson and his wife sat by the fire sad, angry, bewildered, altogether ill at ease. Dorothy lay awake very unhappy. It was not that she suspected her lover of any wrong-doing. That was impossible. She wept over the breach between these two whom she loved so dearly, and fell asleep at last in the midst of a prayer that all might be made right again to-morrow.

The Misses Jorboys and their mother nodded and smirked at Dorothy as they passed her pew in their Christmas finery before morning service. They marveled to see the girl's peaceful face, after the revelation at which they had assisted on the previous afternoon. It was the curate's turn to preach, and he chose for his Christmas discourse a very familiar text about the charity that thinketh no evil. Matthew Wall was a powerful preacher at all times; but to-day he seemed as one inspired, and the hearts of Mrs. Jorboys and her daughters quailed beneath their ribbon-bedizened stomachers as they heard him.

"It was but the common talk I repeated," thought the grocer's dame; "and 'twas for the good of yonder silly child I spoke so plain to her mother."

The parsonage dinner had been put off till half-past two o'clock, much to the parson's discontent, in order that there might be time for the visit to Liscott Common.

"It goes against me to go near the place where the creature lives," said Mrs. Bolton, when the matter was discussed; "but it's best to hear the truth from Jane Gurd."

Mrs. Gurd was the widow of a Hammersley tradesman who had died in extreme poverty. She lived partly by her own labor, partly on charity, and was supposed to be a decent sort of person.

The day was clear and bright. Mr. Wall and the vicar met Mrs. Bolton and her daughter at the gates of the churchyard; Matthew offered his arm to Dorothy, and the mother did not interfere to prevent the girl taking it. In sober truth, the dame was somewhat shaken by the young man's firmness, and she had been not a little melted by that eloquent discourse on the charity that thinketh no evil.

This walk was not unpleasant to Dorothy, in spite of the cloud that darkened her horizon. Mr. Wall, with a rare delicacy, avoided all allusion to the business of the last evening. He talked of his parish work, in which Dorothy was deeply interested. The parson and his wife trudged after the young people, both silent.

"He could never take us to that house if he was the wicked wretch Mrs. Jorboys would have me think him," the dame thought with some sense of remorse. Her confidence in her informant was beginning to falter. She had always liked Matthew; even when most ill-pleased that her daughter should make so poor a match.

They came to the humble little cottage. Matthew lifted the latch and entered, followed by his three companions. Jane Gurd was nodding in a roomy old chair by the chimney-corner, a girl was sitting by a window staring out at the common. Such a girl! If this was Matthew Wall's fancy, it was a passing strange caprice. The girl was the ugliest specimen of womankind on which Mrs. Bolton had ever looked. There was indeed something more than common ugliness in the vacant face, the heavy lower jaw, the low narrow forehead, scant sandy hair, and thick-set lumpish figure. The girl escaped by very little from being a monster.

"I have brought the vicar and his lady to see Betty, Mrs. Gurd," said the curate, as the widow stood up and curtsied to the quality.

The girl neither rose nor turned her head at the entrance of strangers. A figure of stone could not have been more still than this clumsy peasant girl.

"You have not taught the creature manners, Matthew Wall," said the outraged matron, "or she'd be quicker to show her reverence for her betters."

The curate smiled, and turned with a gentle compassionate look to the monster by the window.

"Bless your dear heart, ma'am," cried the widow Gurd, "Betty, knows no more of your honors' coming in at that door than the Emperor of Chaney."

"What!" cried the dame; "can't the creature see us?"

"Lord, no, ma'am; she's stone blind."

"But she can hear us, at any rate?"

"Not she, ma'am; the postes isn't deafer."

"But—but she can speak, I suppose?"

"Four words, ma'am, as Mr. Wall has taught her in this last six weeks. The Lord knows how he found the patience and the cleverness to do it."

"Blind, deaf, and dumb!" cried the vicar's wife, aghast. "O, Matthew Wall, can you forgive me?"

"With all my heart, dear madam. It was but a foolish mistake of the Hammersley folk;" and the curate held out his honest hand to the woman who had wronged him. "Yes, poor Betty yonder is blind and deaf and dumb. I found her in one of the back slums of the town, worse treated than a dog; for the sorriest cur has some ragamuffin that will stand by him; and Betty had no friend. She was beaten, starved, kept in a hole like a rat—a horror to look at, a horror to think of. I told those she belonged to that it was a sinful piece of work, and they only laughed at me. I told them it was against the law; but the law is a slow business, and they snapped their fingers at my talk of constables and justices of the peace. What could I do to help the poor wretch? They called her Idiot Betty, and said she wasn't worth the bite and sup they gave her. I asked if I was free to take her away. They said yes, and welcome too. So I brought her to Dame Gurd. The good soul was willing to take the charge of her and give her a comfortable shelter for nothing, and her bit of victuals costs but a few shillings a week. She was a little strange and difficult to manage at first, from never having known kindness since her wretched cradle, but she soon got to understand we meant well by her, and between us we have taught her a good deal."

"Between us!" cried the widow; "'twas all your doing, first and last, Muster Wall."

"No one need call her Idiot Betty now," continued the curate; "she has learnt to make baskets and rush mats, and can ask by signs for what she wants."

As he said this, the curate went softly towards the place where the girl sat, with the winter light shining on her dull sightless face. As he came close behind her chair the face changed all at once, and when he laid his hand gently upon her head, it was the face of a creature with a soul. The dull common clay—the mindless lump of ill-used humanity—brightened into life beneath that pitying hand. Here was a Pygmalion who might well be proud of his work.

"I have been teaching her to talk," said Matthew, "and I have hopes that she will do something in that way by-and-by. She can say four words—God, bread, mother (meaning the kind-hearted widow there), and parson (meaning me)."

He put his hand upon the girl's clumsy fingers. She understood the sign, and obeyed it. Her mouth opened like a box, and a sound came out of it—a loud, harsh, snapping, disagreeable sound, which was meant for the word "parson." It was more startling than pleasant, but to Matthew Wall it was sweeter than music.

"You'd never guess the trouble he had to bring her to that, your honors," said Mrs. Gurd, proud of this successful performance.

Mrs. Bolton took a seven-shilling piece from her capacious pocket, and bestowed it upon the widow.

"She shall want for nothing while I am alive," cried the mollified matron; and then she turned to Matthew and kissed him. It was an audible smack, that resounded in the cottage-chamber.

"God bless you, Matthew Wall!" she said; "I'd rather see my Dolly the wife of so good a man than riding in the squire's chariot."

RECENT LITERATURE.

Twenty-five Cent Dinners for Families of Six. By Juliet Corson, Superintendent of the N. Y. Cooking-School.

For fifteen cents those in the most straitened circumstances—those whose digestion waits upon an appetite that is never satisfied with really palatable food—can purchase the information that will enable them to cook rationally, at small expense, and in a manner that will make them wonder how they could have existed so long without the knowledge. A dinner for twenty-five cents is no chimera, as Miss Corson demonstrates, and she has taken the utmost pains to combat that gross ignorance in matters culinary by the plainest, simplest directions. The gentle reader is not to suppose that the horn of plenty will be tipped to the lips at an appetizing angle, but the solid information, clearly conveyed in language as tempting as a juicy joint, should bring happiness to many a household, content to thousands of diaphragms! Especially is this little manual commended to farmers' wives whose culinary resources are an arid tract that is vastly in need of some such irrigatory suggestions as will cause the noxious pie to wither and fade, while the abominable fried steak shall be uprooted and live in memory as a mere tradition. To become a Brillat Savarin on a small scale for an expenditure of only fifteen cents, is a worthy ambition. May thousands attempt it!

Bits of Travel at Home. by H. H. Square 18mo, 413 pages. Cloth. Red edges. Boston: Roberts Brothers.

Has it ever been your good fortune to have an acquaintance who was a capital story-teller and an extensive traveler, one who used his eyes to see what was to be seen—his ears to hear what was to be heard, and his tongue to tell you all about it. If so, you know what this book has in store for you? Travels in California—Travels in New England—Travels in Colorado—are divided into thirty-eight stories, each separate and distinct, each a gem in itself and as different from an ordinary book of travel as chalk is from cheese. It is entertaining and instructive; one is not ready to lay it down when a chapter is finished, but is per force compelled to look a little way into another, and when the whole is finished the book is put away with a sigh that there is not more of it.

How to Hunt and Trap. By J. H. Batty. New York: Albert Cogswell, 24 Bond Street. Price $1.50.

Mr. Batty is a Nimrod of varied experiences, and a taxidermist into the bargain. He does not indulge in any glowing description, or wander over limitless fields of personal reminiscence not germane to the subject. His prose is terse and practical. He supplies just such information as would be asked by the amateur if he had set his mind to hunting or trapping with a view to tangible results. Game is described, the best means of securing it are discussed, and the best localities, where it is most likely to be found, are mentioned. We have no knowledge of any book that supplies such useful information in such an available shape as does this one.

How to Take Care of our Eyes, with advice to parents and teachers in regard to the management of the eyes of children. By Henry C. Angell, M.D. Square 12mo. 72 pages. Illustrated. Boston: Roberts Brothers.

Many who are now spending an old age in partial or total blindness might have had this calamity averted by proper care of the eyes in childhood. The author presents in a simple style and free from technical terms, rules and instructions, by the aid of which many of the weaknesses and diseases of the eyes may be avoided, and many of the troubles already consequent on the wrong use of them, may be remedied.

The Iowa Liberal, issued at Le Mars, Iowa, is now published by Messrs Leidy & Phippen, a change having taken place a few days since. Of the Liberal we have heretofore spoken, and we now repeat that it is one of the best country exchanges on our list, is fully up to the times, gives strangers a good idea of the growing Northwest, and deserves the fullest measure of success.

The Homestead, a paper published in the interests of those desiring cheap homes in the West, will be sent to any one addressing S. J. Gilmore Lawrence, Kansas.

BRIC-A-BRAC.

THE HOTEL VERANDA.
JUST AFTER THE ARRIVAL OF THE SATURDAY NIGHT BOAT.

Why! How d'ye do?
Can it be you?
When did you get here, pray?
You know you wrote,
In your last note,
You couldn't get away.

You look quite ill.
(Now don't! Be still!
Don't squeeze my hand! I'll go!)
You've heard! Heard what!
Is it true, or not?
Oh! that! How did you know?

Yes! I've said yes.
To whom? Just guess—
I'll tell you if you're right—
It isn't out,
But you, no doubt,
Can keep it secret quite.

What can you mean?
I might have seen?
Seen what! You never said—
I couldn't guess,
I told him yes,
You don't wish you were dead.

I met him here—
No! Just this year,
There, that's his T cart—see?
Yes! 'tis quite swell,
And the groom as well,
There! that little man? That's he,

I must not wait,
I'll be too late,
He's going to drive with me.
I'll meet you then,
On the piazza, when
It's dark, and he can't see. [*N. Y. World.*

DIDN'T WRITE IT.—Mabel Clare writes us the following flattering inquiry; "Are you the author of that tender little ballad, 'Darling Kiss My Eyelids Down?'" We? We write such stuff as that? "Kiss our eyelids down!" Mabel, thou art beside thyself; much reading hath made thee mad. "Darling, kiss our eyelids down?" Now, isn't that a nice thing to accuse us of saying? Are we that devoid of intelligence! Mabel, don't you trouble our eyelids when you have a fancy to perform any operation of that delicate and tender nature. We have a large, comfortable, roomy, flexible gash just below our nose that has bought county rights for all business of that nature that comes within the limits of our face, and any eyelid found interfering or infringing will be prosecuted to the extreme limit of the law. No, we didn't write it.—*Burlington Hawk-Eye.*

GOING TO PRESS.

THE foreman of a newspaper composing-room died sometime since. Just before his death he became conscious for a moment, and in that gleam dwelling upon the habit of his life, he suddenly exclaimed: "The 'ads' are all right, lock up the forms and let's go to press."

Fellow man, a moment linger
On the dying printer's speech;
For it bears a mighty lesson,
Our unheeding hearts to teach.

Day by day thou art composing
What a universe shall read;
Type to type are ceaseless setting,
As thou addest deed to deed.

Soon the forms are locked forever,
Changeless shall th' impression be,
Scan the proofs in time, O, printer,
Thou art near eternity.

Are the 'ads' all right, composer?
Art thou standing justified?
Ready now for the Great Judgment,
Its unfoldings to abide.

So that now as night advances,
Greet the unstaying pressman's call;
Then await the morn eternal,
Publishing thy life to all.

GEORGE IV.'s extravagance and love of spending had no bounds, provided that it was not his own money that he spent. He always had money, although pretending at the time he hadn't. When he died there was found £10,000 in his boxes, and money scattered about everywhere, a great deal of gold. There were about 500 pocketbooks, of different dates, and in every one money—guineas, one-pound notes, one, two or three in each. There never was anything like the quantity of trinkets and trash that was found. He had never given away or parted with anything. There was a prodigious quantity of hair—women's hair—of all colors and lengths, some locks with the powder and pomatum still sticking to them, heaps of women's gloves, *gages d' amour* which he had got at balls, and with the perspiration still marked on the fingers, notes and letters in abundance, but not much that was of any political consequence, and the whole was destroyed.

"Unthinking, idle, wild and young,
I laughed, and danced, and talked and sung;
And proud of health, of freedom vain,
Dreamed not of sorrow, care or pain;
Concluding, in those hours of glee,
That all the world was made for me.

But, when the hour of trial came,
When sickness shook this trembling frame,
When folly's gay pursuits were o'er,
And I could sing and dance no more—
It then occurred how sad 't would be
Were this world only made for me."

THE author is the Princess Amelia, "the darling of George III.," his youngest daughter. She died on the 16th of November, 1810. The event of her death has an additional interest, because this was the last blow for her poor father, whose incurable insanity is dated from his parting with her on her death-bed.

THE three degrees in medical treatment—Positive, ill; comparative, pill; superlative, bill.—*N. Y. Medical Times.*

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

DEAR RURAL.—The following lines were printed for me more than twenty years ago; in making up my scrap-book I find I have mislaid them. If they will answer for the columns of the RURAL please reprint them, and oblige, M. W.

TO A MOURNING DOVE.

Sweet little birdie tell me why thou mourn'st so lone and long,
Sad tears are gathering in my eyes, as I listen to thy song;
Has thine own mate forsook thy bower, forever flown away,
No more to sit beside thee, say, pretty mourner, say?

Or else perchance thy little ones, so wondrous and so fair,
Unmindful of thy warning voice, thy kind and fostering care;
Far from thy soft and sheltering wing, now fain would seek to fly,
To find a higher, happier home, in yonder azure sky.

Ah, no, fair listening lady dear, thine anxious fears dispel,
'Tis nature's song of gratitude, my little throat doth swell;
From rosy morn till dewy eve, I thrill my mournful lay,
And cheer my mate and little ones, all through the livelong day.

MOTHER'S SUMMER VACATION.

MRS. J. E. M'CONAUGHY.

IF every one were as considerate towards wives and mothers as Mr. Marvin's folks were, they would last a great deal longer, and be happier women while they did live.

The last hired man had gone, and "the work of the reaper was done," and none too early, father thought, as he noticed how weary and worn his wife looked as they sat at the breakfast table the next morning.

"I'll tell you what we shall have to do for mother, children," he said; "we must pack her off to Aunt Susan's for a week. That will chirk her up."

There was silence for a minute at this startling proposal, for mother was not of a kind that could be easily spared. Then Bertie bravely said,

"I'm agreed."

"So am I," said Lewis, rather faintly.

"Yes, mother, go," said Bessie,—who was 'the main spoke in the wheel,'—as father always asserted. If Bessie was willing, then surely nobody could reasonably object.

"You know, father," said Mrs. Marvin, remonstratively, "that Bessie has always been used to having me go ahead with the cooking."

TASTEFUL ARRANGEMENT OF FERNS AND GRASSES.

"So she always will, mother, if you don't cast her on her own oars some time. If our nineteen-year-old daughter can't keep us in provender for one week, I'll get the neighbors to send in something, or maybe, I could get one of the Fisher girls to come over and help," he added, with a mischievous glance towards Bessie.

That young lady gave a slight upward set to her chin, and did not condescend to notice the glance that passed between the two brothers. Rob Fisher had been "shining around" there, as the boys expressed it, considerably of late. But nobody found any fault, for he was as likely a young man, and his farm "as pretty a-lying piece of land" as you could find in the whole country-side.

"Well, Bessie, you and mother talk the matter over," said the farmer, as he took down his broad straw hat; "you coax her into the plan."

"I would go, mother," said Bessie, as she stepped about briskly, clearing the table.

"But I have no dresses suitable, Bessie."

What woman ever did go anywhere without first making one dress at least? We need not laugh at "them," for quite likely you and I belong to the same class. Some cynic even goes so far as to say that if all the women in the country were sentenced to be hung the next day, nine-tenths of them would declare the first thing, "There, I haven't a dress fit to be hung in!"

We are, in a way, all of us Flora McFlimsies in our own estimate as to whether our ward-robes are overflowing, or are in the state of Mother Hubbard's cupboard.

"Wear my gray bourette, mother, for travelling. It will fit you nicely, unless it is a little too long. Then take my nice cambric for afternoons, and your own black silk for church. There, you are fixed out in half a minute, and not a penny outlay. Don't you see what a good thing it is to have a grown-up girl as large as yourself and a little larger?"

"Do you really believe you could get along?" said mother, half musingly, as she looked at the young woman, who was her "little girl" still, and would be for nineteen years more.

"Try me, and see," said Bessie, laughing; "you don't know what experiments I shall try in the cooking line. When the cat's away, you know how it is with the mice. Leave me a full sugar-box and spice-box, if you please."

"You must not pamper the children with too high living," cautioned mother, laughingly, "or they may want to have mother extend her visit. But we will study over the project at our leisure, to-day. I really should like to visit Aunt Susan."

So the matter was finally adjusted. Of course mother saw a hundred lions in the way, but the family set themselves to work to remove them one by one.

Aunt Susan welcomed her with wide-opened arms, and took her to the blue chamber, where she had slept so often in girlhood. There was much to talk of and tell on both sides, though Aunt Susan's quiet household consisted only of herself and a little serving-maid.

The house was a tasteful, cozy cottage in a beautiful elm-shaded street, and as the two ladies sat at twilight on the vine-shaded piazza in the coziest of Quaker rockers, Mrs. Marvin could hardly believe that she was the same hard-working woman, who had cooked and baked that summer time for a houseful of working men. The fresh cambric seemed so dainty and cool, and the blissful rest so delightful! What a good thought it was of father! If he would only do the same for himself! She would just see to that when she got home

Bessie had protested against her taking any sewing, but mother said she must take her knitting-work, or she should be home in two days. So they compromised on the knitting question, and mother had to send out and buy more yarn the third day.

"If you can only content yourself a little while, dear, you will get your family supplied for all winter," said Aunt Susan. Her own enthusiasm was awakened, seeing Mrs. Marvin's needles fly so fast, so she joined in the business and they had regular knitting bees every day. Old friends dropped in often, and one afternoon Auntie had a real old-fashioned quilting, which seemed to renew her youth, and took Mrs. Marvin back at least twenty years in her own history.

It was a visit to be forever remembered, but no entreaties could prevail on her to stay over the set time. More and more the query would come up, "How are they getting along at home?" and she felt that nothing would answer the question but actually seeing.

Father and little Dick were at the depot, smiling and watching anxiously, until at last mother appeared with "little box, big box, band-box and bundle," for Auntie was a famous hand at never forgetting anybody.

Mother was the center of attraction that evening, and was hung over and kissed and talked to as she had not been in half a dozen years. It was a good thing to go away once in a while just for the pleasure of the home coming. She had, down deep in her heart, however, the feeling that "the best of a journey is getting home," for there was where her treasures were. The gifts were distributed and gave a world of delight to the little folks. Little Dick said, as he nestled close to mammas side, "Next time you go, I want you to take me."

GRASSES are easily arranged in many beautiful forms. Now, that many sorts are in bloom in the meadows and fields, is a good time to collect them. The accompanying cut needs no explanation—a wire platform extending up as high as taste suggests, with the grasses so arranged as to conceal the wire.

ITEMS FOR CORRESPONDENTS.

BY THE EDITOR.

I ACKNOWLEDGE with thanks the following directions for the extermination of bed-bugs which some RURAL ladies have been so kind as to furnish in reply to a question asked a week or two ago, through these columns.

SOME one, signing herself a "Rural Subscriber," asks something relative to leather work but I cannot gather from what the lady writes just what she wants to know. Is it how to ornament leather for a what-not? If the correspondent will write a little more explicitly, I shall take pleasure in replying to her inquiry.

ELLA LESLIE, Venango Co., Pa.—Trim your underskirt with a deep-plaited flounce. I'd recommend the "washer-woman" overskirt, and you can either have a basque and vest or a waist buttoned at the back, and ornamented with six plaits, back and front.

I ASSURE the aggrieved lady that I sympathized with her or any one afflicted with this pest. But I found out a *certain* preventive for future young families of bugs as well as the means of destroying those which had already been established. Very salt water will set all right—sometimes with one application only. Pull the bedsteads apart and wash every lurking-place thoroughly, leaving the brine to dry on the bedsteads. Powder every available crack or joint with fine salt, and fill up any place with the salt that can be filled. Wash the corners of the mattresses with clean salt water, and let it dry on. MRS. S.

THE only remedy I have ever used is the following: 2 ozs. oxalic acid, 1 pint common whiskey. Keep corked in a bottle ready for use a few hours after mixing. It should be applied with a small paint brush. As it is a deadly poison care must be taken to keep it from children.

AN old housekeeper answers the query in a late RURAL NEW-YORKER, "What will exterminate bed-bugs?" Removing into an old house the bedsteads became infested with bugs. Carbolic acid soap was moistened and pressed into some old screw holes of a mahogany bedstead, which could not be thoroughly cleaned, and proved entirely efficacious. Common bar soap was used for cottage sets of light colors and the spring frames, and no bug has since been found in the bedsteads, although occasionally one or two have been found deposited on the bedding—probably brought by guests. The house has for several years been entirely free from the pest.

COAL-OIL is good, also corrosive sublimate dissolved in alcohol, and applied with a feather, will kill them immediately. It is also good to put around the feet of a safe or cupboard to keep the ants out, but anyone using it must remember it is poison. MRS. W. H. CARPENTER.
Warren Co., Ohio.

STAINING WOOD.—In the RURAL NEW YORKER, page 349, I find a request for a receipe for staining wood. For black walnut stain, I simply use sulphatum varnish, thinned with spirits of turpentine, and apply with a brush. It can be made light or dark as desired. F. H. D.

SOME one wants a cure for bed-bugs. I send this, which I will warrant. Wash the bedstead and wall, if the bed stands against it, with cold salt water (March is the proper time), then oil with any soft oil—lamp-oil is best.
MRS. J. C. COLLINS.

USE clean lard. Put it in every crack and crevice of bedsteads, walls or washboards. Take the bedsteads apart and fill the mortices full—whatever squeezes out can be wiped off. Cover every greasy part with thicknesses of newspaper to keep the bedding from getting soiled. Leave the lard in one year, to insure all eggs to be killed. It may have to be renewed several times as it dr s away. This is not as expensive as corrosive sublimate, and is a perfect remedy.

CORROSIVE sublimate in turpentine, put on with a feather, is a sure remedy. One ounce to one pint turpentine. WM. H. M.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

BUTTER MAKING.

Our gentlemen farmers are falling into the habit of discussing butter making as though it were their especial province, and as if they performed all of the labor and understood all the minute details of the business. They no doubt *think* they do, and we housewives are perfectly willing to give them their just dues, but somehow the care of a dairy comes rather hard upon us wives. Our husbands and sons may milk the cows, strain the milk, churn the butter, wash and work it over and pack it in tubs and boxes—all of which is a great help and lightens womens' labors very much—but the skimming of the milk, the keeping of the milk pans, churn, milk-room, etc. pure and sweet, with no sour smell to taint the cream, are all a woman's work. A sweet milk-room with a right temperature is of vast importance in the manufacture of good butter. There is little danger of keeping things too nice. By this I do not wish to imply that daily mopping of the floor is either a necessity or a benefit. On the contrary, the less you wet the floor the sweeter the room will remain. Once a week is often enough to give the place a thorough wetting. Add a little carbolic acid to the water and wipe the floor very dry and every sour or musty odor will be dispelled. Sunshine is a necessity in the milk-room. A little morning brightness helps to keep the atmosphere pure and wholesome. Flies and dust must be excluded while fresh air is admitted. Screen cloth will serve to keep the flies out, while cloth frames hung from the tops of the window frames, on the outside, will keep out the dust and will also give a perfect circulation within. I do not like water in any form about the milk-room. I have tried several methods of using it, such as running water, passed through tubs in which the pans were set; pans with water-pipes passing through them, etc. Butter made from cream which has risen in a dry atmosphere is certainly of better quality than that made where there is a water moisture exhaled constantly. And it is also firmer and keeps better.

I like large, flat pans best, for we get more cream from them; it is much easier to skim them than if they were smaller and deeper, and they are easier to keep clean.

I did not try the Cooley system of setting the milk in tin cans and placing them in a water tank, for years of experience had taught me that air was a necessity to the making of perfect butter. Those who were at first enchanted with this new arrangement have after a few months' trial discarded it and gone back to the open pans.

Perfect butter requires perfect management in making, as also perfect neatness. Dish-cloths, towels and strainers cannot be kept too sweet, and the breath of blooming flowers and green grass in a milk-room is of benefit. No odors which are not sweet should be admitted. Mats to wipe the feet upon are a necessity before coming in from the cow stables or yard, and sometimes the bottoms of the milk-pails need wiping too. A housewife has all this to see to as well as to know that a broom has been used to brush off the cows before milking that no dust or hairs shall fall into the milk. Good sweet pasturage as well as fresh, running water must be provided if good butter is to be the result. Stagnant water will impart to both milk and butter an offensive taste, and impair the health of the cattle as well. Frequent salting is not to be neglected as the butter comes much quicker and is harder if this be not omitted. Never put the hands into butter. There is no excuse for so doing, and every sense of cleanliness forbids it. True, the hands are clean, still as butter absorbs any and every impurity with which it comes in contact, excessive perspiration of the hands or any humor of the blood might thus be imparted to the butter. A wooden ladle to lift the butter from the churn, or to turn it over while being washed, answers just as well, and a vast deal better. As regards salting, use the best salt, and to work in just the right quantity, weigh both butter and salt. As regards quantity, there can be no rule, taste of the consumers alone being consulted. If the butter be well worked before salting, less salt is required than if salted when partially worked. Tubs and boxes should be well looked after before the butter is packed in them. Scrub them and soak in brine for a few days, then wash thoroughly and rub the inside with a little salt before packing in the butter.

GRANDMOTHER.

HOUSEHOLD HINTS AND RECIPES.

Care of Carpets, etc.

It is necessary to watch carpets closely in summer, especially if the early part of the season be rainy. Damp rooms, as well as dark ones, favor the ravages of moths. The good old rule of sweeping every Friday, whether rooms are used or not, should be heeded, as frequent sweeping and dusting disturb those little pests. All articles of furniture should be moved on sweeping day, not only to do the work more thoroughly, but to dislodge the moths, should there be any. After sweeping, strew fine tobacco or camphor gum all along the edges of the carpet. If pictures are hung by worsted cord, brush it often with the broom that is kept for walls. Lambrequins, if of woolen fabric, ought also to be brushed every few days. Some good housekeepers scatter corn-meal over carpets just before sweeping; others use salt. I prefer the latter, for it seems as if the meal would tend to harbor the moths. Woolens and furs, which were put away in newspapers in the spring, should be examined now, aired and beaten, and put up again in fresh papers. It is to be hoped that each parcel is labeled, in legible writing, so that when wanted—it may be in haste—no time need be lost. Neglecting to label articles leads to a great waste of time, in obliging one to undo and turn over a dozen packages, perhaps, before finding the one wanted.

Wedding Cake.

Three-fourths pound butter; one pound brown sugar; eight eggs; one pound flour; two pounds currants; three pounds raisins; one pound citron; one teaspoonful each of ground cinnamon, cloves, and nutmeg; half teacupful of molasses; half teacupful of brandy; one tablespoonful of thick sour milk; one tablespoon *even* full of soda dissolved in the milk.

To make: Soften the butter, and stir to a cream; add the sugar, and beat till light; then the eggs *without beating;* next the molasses, brandy and spices; then the fruit, which must first be rubbed with flour, to prevent settling; a teacupful of flour extra, or more, will be needed for the purpose. Work in the pound of flour, and, last, the soda and milk. Mix well, but quickly, after the soda is added, and place immediately in the oven. Bake in a tin milk-pan, holding six or eight quarts. The sides of the pan should be buttered, and the bottom of it covered with thick white paper, well buttered. It is best to put a tin cake-tube in the center of the pan. Any tinner can make one; it is only a scroll of tin, seamed at the sides with solder, and about six or seven inches long, and two inches in diameter at one end, and one inch at the other. By making an oblique cutting at the small end, the tube will answer to core apples with. If a tube cannot be obtained, it will be best to bake the cake in *two* basins holding three or four quarts each. Have very little fire when the cake is put in the oven. It will require an hour for it to *melt* and *rise*. It then begins to bake, which will take about two hours more. The heat may be increased after the first hour, but must not be quick, at any time. If the cake becomes brown before it is done, cover with paper, or put a dripping-pan on upper grate, directly over the cake. It is well for the housekeeper to make all necessary preparations for fruit-cake the day before it is to be made, as it saves time and fatigue at the time of baking. Even a week before wanted, the raisins can be seeded, the citron finely sliced, and the currants washed and dried. In that case, turn the brandy—one-half cup—over the fruit and cover closely.

Soda Biscuit.

One quart of flour; three teaspoonfuls of baking-powder; one-half teaspoonful of salt; all stirred together very thoroughly. One tablespoonful (heaped) of butter; one-half tablespoonful of lard mixed with the flour, etc. Sweet milk and cold water, equal parts, to make a soft dough; do not knead it. Roll an inch thick, cut into shape, and bake quickly. Instead of baking-powder, soda and cream-of-tartar can be used.

Muffins.

One heaped teacupful of flour; two teaspoonfuls of baking-powder; one tablespoonful of white sugar; one beaten egg; one tablespoonful of melted butter; one teacupful of sweet milk. Drop from a spoon into muffin rings set in pie-tins, and bake in a well-heated oven.

Graham Gems.

One teacupful of Graham flour; one teacupful of white flour; two teaspoonfuls of baking powder; one tablespoonful of brown sugar. After stirring, add one beaten egg, one large spoonful melted butter, and sweet milk to make a rather thin dough that will fall easily from the spoon. Drop into *hot* buttered gem irons, and bake on the upper grate of the oven. If made according to directions, the gems will be very tender and light.

M. G. R.

Lyons, Iowa.

DOMESTIC RECIPES.

Bread Pudding.

One pint of grated bread crumbs, one teacupful of sugar, six eggs, one quart of milk flavored to taste. Save the whites of four eggs, beat to a froth, add three tablespoonfuls of powdered sugar, and when the pudding is done pour over the top, and set in the oven until a nice brown.

Lemon Pie.

Press the juice from one lemon into a bowl and set aside. Then grate the remainder, and add to the grated part one cup of sugar, one whole egg and yelks of five others, two tablespoonfuls of flour, one quart of hot milk, and a pinch of salt. This fills two round tins. When the pies are done, put the following mixture on top: The juice of the lemon, and the whites of the five eggs beaten to a froth, four tablespoonfuls of sugar. Place in the oven for a few minutes, but be careful not to brown.

Jelly Cake.

One cup of sugar, three tablespoonfuls of butter, three eggs, three tablespoonfuls of milk, one and a half cup of sifted flour, two teaspoonfuls of baking-powder. This makes four layers.

MRS. M. ALDRICH.

Grandmothers Pancakes.

Three eggs, three tablespoonfuls of sugar, six tablespoonfuls of sweet milk, three tablespoonfuls of sour cream, one-half teaspoonful of soda, one-half teaspoonful of salt; spice to taste; stir to a thick batter, and drop by the spoonful into hot lard and fry like crullers.

D. M. J

Baked Pears.

Peel and bake ripe pears, with but little water. When cold, cover the top and sides with a cake-icing flavored with vanilla, and serve with cream and sugar. This makes a delicate and healthful dessert, and but little time is consumed in its preparation.

Tart apples may be baked in the same way, and are preferred by many.

Cucumber Toast.

Peel fresh, crisp cucumbers of medium size, cut lengthwise in thin slices, and place in cold water for a few minutes; drain, and dip each slice into flour; then fry quickly, until of a light-brown, in butter or beef drippings. Place the slices of cucumbers, hot from the pan, between slices of buttered toast and serve at once. The cucumbers may be seasoned with pepper and salt, or a little mustard may be added when taken from the pan.

Egg Plant.

Peel and cut into thin slices; soak in salt and water ten minutes; drain and steam five minutes. Make a batter of one pint of sweet milk, two beaten eggs, one-third cup of melted butter, one heaping teaspoonful of baking-powder and flour, to make batter as for pancakes; dip the slices into this, and fry in butter until of a light-brown.

Tomato Sauce.

Take full-grown tomatoes while yet green, cut out the stems, and stew until tender; press through a sieve; season highly with pepper, salt, ground cloves, allspice and nutmeg; boil the pulp until thick. Worcestershire sauce may be added if liked. Nice with cold meats. E. M.

News of the Week.

POLITICAL.

Monday, Aug. 5.

The Potter investigating committee has transfered the scene of its labors from Atlantic City to New York. Secretary Sherman has sworn, a trifle late, that he never wrote that so-called Sherman letter. Had his memory been equally clear on the matter, when he was formerly before the committee, much trouble would have been avoided and his memory would have helped much more effectually to clear his reputation. Now his enemies say that his recollection has been sharpened by the knowledge that the document cannot be produced to confound him with his own handwriting. Sherman's character, however, has always stood high, and as between his word and the oaths of the self-confessed perjurers who have glibly testified against him, few would hesitate to accord credit to the Secretary.

Yellow fever has peremptorily put an end to the labors of the sub-committee "smelling out" fraud in New Orleans. The most important testimony it took was that of Major Burke, a shrewd and trusted Louisiana democrat, formerly an independent. He swore that as the accredited representative of Gov. Nichols, he, together with several other prominent democrats, held a conference at Wormley's restaurant, in Washington, with a half dozen republican friends of Hayes, just before the House had confirmed the decision of the Electoral Committee assigning the presidency to the present incumbent. At the time there was a Bourbon party in the House trying, by filibustering, to delay the action of that body until after the fourth of March, thus nullifying the verdict of the Committee and throwing the presidential election into the House, or necessitating a new election. At the conference the democrats agreed to put an end to this filibustering on condition that Hayes should withdraw the troops from Louisiana and South Carolina, and recognize Nichols and Hampton as governors of those States, instead of Packard and Chamberlain. These terms were accepted by Hayes' friends, and he, himself, confirmed the agreement before he became President. The democratic dallying clique were at once overruled by their own party, as per agreement; Hayes was declared President, and fulfilled his contract. So much for the famous "Wormley Bargain."

The Supreme Court of Louisiana again asserts the doctrine of "State Rights" by deciding that Congress has no right to proscribe rules of evidence for State Courts, and that therefore it is not necessary that a United States internal revenue stamp should be affixed to a note or mortgage to make it competent evidence in the Louisiana Courts, though an act of Congress declares such unstamped instruments void. South Carolina, too, is again coming to the front in the same way. Some United States revenue officials on the hunt after a notorious "moonshiner" named Redmond, killed a man whom they mistook for him and who had just missed fire in shooting at them. They surrendered to the next authorities; were confined in prison without bail by a local judge, and when the officers of the United States Courts demanded their surrender it was stoutly refused. The law, however, is said to be clear on the matter; but rather than give them up, the State Judge will resist the decision of the United States Judge. Gov. Hampton urges that the case should be made a test one before the U. S. Supreme Court, to prevent bloodshed. President Hayes will, doubtless, conciliate the Palmetto State by consenting to this or any other proposition likely to soothe the ruffled feelings of the high-toned, Southern chivalry.

In Tennessee the main question to be decided in the fall election is whether the State shall repudiate its debt; and if not, how much it shall offer to pay. It is thought probable that the "State's men of honor" will be too powerful for the right-down repudiationists, and generously compromise by consenting to pay one-third, or 33⅓ per cent., of the indebtedness. Should the out-and-out repudiationists sweep the convention to meet a fortnight hence, the other party is expected to nominate Postmaster Key as an independent candidate.

MISCELLANEOUS.

The second person punished in Virginia, under the new law establishing the whipping-post, was a comely white girl of 17. She received 25 lashes laid gently on her bare back by a negro constable. Her crime, a petty theft. The President has proclaimed that Great Britain and the United States have agreed that the subjects of each nation shall have, in the other's territory, the same rights as native subjects in everything relating to property in trade-marks and labels. Last Tuesday a severe hail storm in Carver, Rice and Dakota counties, Minn., did much damage to crops. In the first-named county stones four and five inches in diameter covered the ground to the depth of two or three inches. Charles Montange was arrested in this city last Tuesday on complaint of George Clark, of Springfield, Otsego County, in this State, in suit for $46,000 damages for property alleged to have been burned within the last three or four years, by an association called the Montgomery Tenants' Mutual Society, to which, it is charged, Montange belonged. Clark is said to be the largest land-owner in the State, having between 40,000 and 50,000 acres in four counties. This was leased out for long terms at small rentals; the leases have lately been lapsing, and from two to three dollars an acre rent has been demanded. This increase has exasperated many of the tenants; some of them have gone elsewhere; others threaten new-comers who take the place of those evicted, and much property belonging to Clark has been burnt and otherwise injured. Nothing can be collected from the present prisoner, who is poor; but it is hoped to force him to turn State's evidence and so to secure the conviction of others who have means.

In some parts of the West there is a sad scarcity of willing labor to gather in the crops. The country is flooded with tramps who are said to refuse in some places as much as $2.50 a day and board; a tramp refuse money or good grub! Surely not. Work, of course, the regular tramp won't accept—but bread and meat as well as the price of whiskey—Never! The citizens of St. Louis who are opposed to spending $100,000 a year to have german taught in the public schools having had no attention paid to their protest by the School Board, are collecting subscriptions to test in the courts the legality of expending public taxes to teach anything except a common English education.

Lately at Cleveland, Ohio, Rarus, the celebrated California trotter, made the three fastest heats on record 2. 14½, 2. 15, 2. 14 equaling Goldsmith Maid's best time in the last heat. Again on Saturday last, at Buffalo, he trotted three mile-heats, against time, a running horse keeping by him most of the time, to stimulate him to greater exertion. The first heat he made in 2. 17; the second in 2. 50; the third without a break, in 2. 13¾, the fastest time on record. It is said that an enthusiastic admirer instantly offered for him $65,000; and that the offer was promptly refused.

Yellow fever is growing worse in New Orleans and all the surrounding towns are anxiously endeavoring to keep the pest from entering them, by strictly prohibiting the entrance of either passengers or merchandise from the afflicted city. Yesterday there were 20 new cases and 11 deaths. Nannest & Co., country produce commission merchants, doing business in New York, have failed. Liabilities 14,000, Assets, 1,000.

The wheat "corner" in Chicago and Milwaukee came to a head on Friday. In the former city, the highest cash price paid was $1.10. At the close, however, $1.10¾ was paid for July. There is a great discussion whether the contracts can be filled with winter wheat instead of spring, and a test case will be made in the courts. In Milwaukee the corner was stronger; more excitement prevailed, and towards the close the price was run up by a large operator to $1.30, for July wheat, at which price delinquents must settle. The national debt of Canada is $133,000,000, an increase of $58,000,000 since the Dominion government was established, eleven years ago. The debt of New York City is upwards of $127,000,000, despite the reduction of $4,000,000, during the past year.

The Philadelphia permanent Exhibition has once more been quietly opened on Sundays—for sacred concerts nominally. 'Tis doubtful if even this move will make the thing begin to pay. In Canada the wheat crop is reported above the average in quantity, and of average quality. Spring wheat is less satisfactory than fall; oats are only fairish, and a smaller area has been planted than last year; barley is good; but the acreage planted is less than usual.

His name is not Keely this time, but Francis Winters, Jr., and he lives in New York instead of Philadelphia, but his newly-discovered motor looks to the uninitiated marvelously like that advertised under the former name. The contrivance in which it is generated consists of two chambers, a few pumps and valves. Into one cylinder water is poured, the pumps are set a-going, and straightway in the other cylinder there is something found which burns like gas, but in whose odorless flame the hand can be held without burning, which neither explodes nor generates friction, heat, or moisture; and which, at half the cost of steam, will do all that steam can do. Its inventor has organized a company with a capital of $10,000,000, one-eighth of which is said to be already subscribed. He proposes to store his power, or motor, in a huge reservoir or tank that wont explode under a pressure of 1,000 pounds to the square inch, and peddle it out through pipes wherever it is wanted.

The Boston Belting Company, ruined by Tappan, is going into bankruptcy. But for his misappropalation of funds the company would be clear of debt with a surplus of $250,000. The business will be resumed with a new company. The New York Belting and Packing Co., which he also swindled heavily, has compromised with its creditors. It will pay in full, in installments, during three years. Efforts are being made to bring the defaulter to trial criminally; but—well, he has rich and influential friends and relatives. New England has lately spawned a number of first-class swindlers, such as Pond, Grace, Hathaway, Winslow, Sibley, Wright, Jackson and Tappan, all thoroughbred Yankees, and, of course, all strait-laced Pharasees. Be careful about giving change for $100 bills of the Pittsfield, Mass, National Bank, as there is an excellent counterfeit of them in circulation. It has already cost nearly $300,000 to look after the wreck of Jay Cooke's property. Unless the matter is closed up soon, lawyers, receivers, etc., will pocket every cent of the assets, leaving nothing for the long-suffering creditors. The State Treasurer, Gates, of Mo., is accused of cheating the State out of $250,000, by depositing $500,000 in a national bank whose president is one of his bondsmen, just before it failed and paid only 50 per cent. to its creditors. His whole accounts are in an unsatisfactory condition. It is said that Secretary Schurz's decision about Pacific railroad grants is to be opposed in the courts on the ground that the law says: "If the lands shall not be sold or otherwise disposed of within three years," they shall be subject to settlement or preemption. It is held that as the lands are mortgaged, they have been "otherwise disposed of." There is going to be a great strike in the Pennsylvania coal regions! There will be no strike this year in the Pennsylvania coal regions! A strike in the Pennsylvania coal region is at present impossible, but it will come later on! All these reports are on excellent authority!!!

FOREIGN.

The two conservative factions on which the government mainly relied in the last assembly were 77 strong in the old House now they muster 93; the two liberal factions which in the old House numbered 163 among whom the moderate men generally voted with the Government, now number 110; the ultramontanes formerly numbered 98 and now they amount to 96. Sixty-two second ballots will be necessary and from these elections each party will doubtless obtain some gains. But in any case Bismarck will not have a majority and must appeal to the moderate liberals or ultramontanes, and very probably it will be to the latter.

In England, during the week, there has been an acrimonious debate in Parliament on the late treaty of Berlin, and also in conjunction therewith, on the responsibilities England has undertaken in the East. Had the Government been hard pressed, Beaconsfield would have dissolved Parliament, appealed for support to the country, and would, in the present state of popular enthusiasm, have secured an overwhelming Conservative majority. When the vote reflecting censure on the Ministry, however, came to be taken on last Friday evening, it was rejected by 338 to 195. On Saturday, Beaconsfield and Salisbury were feasted and *feted* by the Lord Mayor of London, and in his after-dinner speech the Premier disclaimed any intention of advising Her Majesty to dissolve Parliament at present.

Some four or five weeks ago, it was here related how Bismarck found the German Reichstag not quite as obedient as he desired, and how believing that the attempts on the Emperor's life had roused a warm feeling of grateful loyalty throughout "fatherland," the wily diplomat dissolved the unruly assembly in the expectation that the people would send back another more amenable to reason—of the Bismarckian type. The elections have just taken place, and from present returns it would seem that these flattering expectations were somewhat delusive.

The Papal Nuncio at Munich has had several conferences with the great Chancellor, at Kissingen, and it is well understood that peace is to be re-established between Berlin and Rome. In the latter city Cardinal Franchi, chief minister of the Pope, and the most powerful of his competitors for the tiara, is dead, and has been succeeded by Cardinal de Luca.

Ratification of the treaty of Berlin has been exchanged between all the Powers except Turkey. Austrian troops have entered Bosnia, and are meeting with a guerrilla resistance from the inhabitants. Italians, it is said, are encouraging this opposition to their old enemy, Austria, and the feeling between the two governments is reported to be growing bitter.

Servia is discontented at the name of a principality and wants to be called a kingdom. The Marquis of Lorne, Queen Victoria's son-in-law, and the newly appointed Governor-General of Canada, will not cross the Atlantic until some time in November, after the Canadian elections—meanwhile the commander of the forces will act as his substitute. HERMAN.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Aug 3, 1878.

BEANS AND PEAS.—Medium beans have a fair trade for the season. The warm weather has rendered some stored lots off in quality and some irregularity in prices may be looked for. A good many parcels are already offered at the under rates. Marrows are firm and the offering is light. Some country owned lots are being held for higher figures than current quotations. Other grades, except R. K. of beans, show an easy tone without much business; Red Kidney scarce and high for prime smooth and even. Green peas firmer, with an advance in western freights; held $1.25@1.30. Southern B. E. peas nominal at $3@3.25 per 2-bu. bag. Canadian peas scarce; the small stock held for better figures than the nominal ones of 76½@77c. in bulk and bold.

Receipts of beans past week, 6,282 bush.
Exports, 456 mds. Exports of peas, 1,100 bush.

We quote medium beans, prime, $1 55@1 57½; fair to good, $1 35@1 50; marrows, prime, free on board ship, fair to good, $1 57½@1 60; Pea, $1 35@1 50; white $1 60@$1 62½; kidney, $1 35@1 50; red do., $3 25@3 50; black $2 35@2 40; Lima, $5 75@4 25.

BEESWAX.—A small business is in progress at 27@28c. for Western and Southern.

Exports past week, 2,300 lbs. Since Jan. 1st 112,500 do. Same time last year, 77,125.

BROOM CORN.—Matters are at a stand pending the new crop. Nominal prices are: 6@6½c. for hurl and short brush; 5@6c. for medium green, and 4@4½c. for red and red tipped per lb.

BUTTER.—Receipts for the week 35,316 pkgs.; do. last week, 33,772 do. Receipts ensure a supply of what leads the demand at this season—strictly fine butter. Buyers who are willing to pay for extra trying must have faultless stock and in this way fancy pails and half tubs may be quoted at the extreme. State Creamery still obtains the first call and there have been scant days when 25 cents was paid for little extra grocers' parcels. Choice invoices of State Creamery are firm at the close at 23c. Good or pretty good State has no definite place, as fresh western that is right has more attractive prices for medium and market buyers. Western creamery is slow of sale and few lots can be named at 20cts.; in fact, some regular dealers are over-supplied with it and would distribute it to jobbers or other commission houses at the under rates. Trade, however, has such an easy movement that most receivers can depend upon their own receipts to piece out daily wants. There is a decided lull in the export trade. Shippers have operated very timely; the largest express a determination to await results from abroad, before renewing wholesale operations.

State creamery, choice, 22@23c.; other, 19@21c.; half tubs and pails, choice, 18@19c.; other, 13@17c.; Welsh tubs, best, 17@18c.; other, 12@14c.; poor State, 9@11c.; State firkins, 16@19c.; Western creamery, choice, 20c.; other, 16@19c.; Western dairy, best, 13@14c.; other, 9@12c.; factory (ladle packed), 9½@10c.; other, 6½@8c.; milled Western, 6½@8c.; old and grease, 3@5c.

Exports for the week, 12,535 pkgs.

CHEESE.—Early in the week the market broke sharply; 7¾ was difficult to get for fancy lots, and a considerable quantity of good stock was offered as low as 6¾c. This was due to the liberal accumulations that had been carried over; larger supplies steadily arriving than looked for, and the fact that exporters were very indifferent; the heavy shipments that had been made to the other side were apparently forming a momentary glut there, and the advices were dispiriting. Towards the close exporters have shown a little more interest, and, with receipts falling off, prices are the turn, steadier. Exports have reached 88,000 boxes for the week.

Quotations are for fancy, 7¼@7¾c.; 6½@6¾c. for good and prime; 5¼@6c. for fair; 4@5½c. for half skimmed; 2@3½c. for skimmed. State, farm dairy at 6¾@7¾c. for good to choice, 5@6c. for fair to good and 2@3c. for poor skimmed. Wisconsin factory, fine to fancy, 7¼@7½c.; do. good to prime, 6@6¾c.; do. fair, to good 5½@6c.; Western factory, fine, full cream, cheddar, 6¾c.; do. fine, full cream, flat, 6½@6¾c; do. slightly skimmed, flat, 5¾@6¼c.; do. half skimmed, 4@5c.; do. full skimmed, 2@3c.

Exports, past week 88,421 boxes.
Receipts for the week, 107,557 boxes.
Gold closes at 100¾.
Liverpool cable quotation, 43s.

DRIED FRUITS.—The only business is in small lots of new fruits, which go at variable prices; cherries are held a little higher, but for other sorts there is a disposition to await larger assortments. New blackberries, are quoted at 7¼@7¾c. Peaches—Georgia pealed, 4@5c.; new, 4¾c. for poor to prime; unpeeled old halves, 3½@4c.; quarters, 3@3½c. Pitted cherries, 11c.; New York State plums, 12c.; southern plums, nominal. Apples—State quarters, 3½@4c.; do. sliced, prime, 4½c.; good, 3½@4c.; western quarters, 2@3c.; southern at 4@4¼c. for prime sliced; 3@3½c. for fair to good; southern quarters, 2@3c.; Tennessee quarters, in bags, at 1¾@2c. New raspberries, 22@22½c., and evaporated, 24@25c.

Exports past week, 267 obls. apples. Since Jan. 1st, 10,328 do. Same time last year, 25,400 do.

EGGS.—Receipts for the week, 6,002 bbls.; do. last week, 7,913 do. The market has been a badly-shaped one for a fortnight. Near points are absorbed in the country. Western are turning out at severe losses, many totally spoiled. Canadian have lost their usual warm weather reputation, and it requires a fine mark to bring 11c; very few Western attain that figure. States have about the steadiest sale, but even these do not give their customers satisfaction. Cold storing is still a problem; experiments are being made in packing so that stock does not sweat so badly after coming out of the chill. Oat hulls is the latest improvements.

We quote near points, 14@15c.; State, 13@13½c.; fresh Western and Canadian, 10@11c.; inferior 10c. down to 6c.

FLOUR.—All grades have felt the advance on wheat. The Minnesotas are decidedly higher; also from the crop reports there has been a liberal business.

Latest prices are $3.35@4.00 for very inferior to fancy superfine State; $4.00@4.20 for poor to good extra do. odd lots and lines; $4.20@4.50 for good to very choice do.; $3.35@4.00 for very poor to fancy superfine Indiana, Iowa, Michigan, Ohio, &c., $4.00@4.20 for inferior to good shipping extra do. and $4.20@4.50 for good to very fancy extra do.; common to about choice white wheat extras, $4.30@5.40; choice to very fancy do. at $5.50@6.50; red and amber winter wheat, inferior to very choice trade and family at $4.15@5.75; round hoop Ohio at $4.00@$4.30, and trade and family brands of do. at $4.35@$5.75, the latter rate for choice, (very choice to fancy lots quoted higher); St. Louis, $4.25@5.00 for very poor to good extra, and $5.00@5.25 for good to very fancy; Minnesota clear, very inferior to very choice at $4.20@5.75 (fancy brands at higher prices); Minnesota "straight," very inferior to very fancy, at $5.25@7.25, and patent poor to strictly fancy at $5.50@8.75; unsound stock at from $2.00@5.25; city mill extra at $5 00@5.75 for West Indies (the latter rate for fancy in new packages); do. for England, 4.05@$4.25; do. trade and family extras, $5.05@6.75; do. for South America, $5.25@5.85 for fair to fancy; No. 2 $2.25@3.25 for inferior to fancy.

CORN MEAL.—Sales are at $2.30@$2.35 for Brandywine, and $2.15@$2 35 yellow Western.

FRESH FRUITS.—A few invoices of peaches have shown fine quality; latest arrivals have run poor. Md. & Del. "Crawfords," $1.50@2.50 crate; "Yorks" and "Trochs," $1.25@1.75; baskets, $1@1.37. N. J. "Hales," $1.00. N. C. quoted $1.50@2.50. Apples are plenty and prices are easy. Nyack pippins, $1.75@2 bbl. Sour Boughs, $1.25@1.75; sweet, $1.50@2. Red Astrachan, $1.75@3.25; good poor, $1@1.50. Pears are coming freely. Southern Bartletts, extra, $4@4.50 crate; good, $2.00@3; very common, $1@1.75. Manning's Elizabeth, N. J., bbl., $3@4; Catherine, $1.50@5; Bell, $3.00@4; Scooter, $3@3.50; Jargonelle, $3@3.50; cooking, $2@2.50. California, $1@5 box, prime; soft, $2@2.50. Cal. plums, $3@4 box. Grapes, N. C. & Delawares, 10@12c. lb; Ives and Hartford, 8@10c. Blackberries are doing better; Wilson's, 7@8c., pints; Lawton's, 6 @7c.; poor, 3@5c. quart. Whortleberries, best, $2.00@3.50. Ga. & S. C. Watermelons, per 100, $15@25; N. C., $10@20. Muskmelons, Jenny Lind, bbl., $3.50@3.50; citron, $1.50@2.50. Peanuts dull; sellers willing to shade prices. Va. hand-picked, $1.50; other, $1.25@1.35. Hot-house grapes, Black Hamburg, lb., 50@75c.; Muscat, 50@75c.; Sweet water, 40@50c.

GRAIN.—Speculative manipulation and brisk export demand have carried prices of wheat up, and there has been an active business. Corn is also higher, and oats, at little easier prices have a fair sale.

Latest sales are for wheat No. 3 white at $1.00; No. 1 white at $1.19@1.21 for new and $1.21@1.24 for old; white State at $1.25; extra white at $1.27; No. 1 amber, round, at $1.10; No. 2 amber, in lots, at $1.07@1.08; No. 2 amber, steamer grade, at $1.05@1.05½; No. 2 red, steamer grade, at $1.04@1.05½; ungraded white at $1.08@1.21; ungraded amber at $1.05@1.10; ungraded red at $1.00@1.18; No. 2 Milwaukee spring, $1.08; No. 2 red $1.07½; No. 2 red, part near arrival, at $1.06@$1.07½, closing strong at $1.07½; New York No. 3 red, August option, at $1.06¾@1.07½; do. September option, at $1.00¾@1.07; New York No. 2 spring, September option, at $1.07; do., October option, at $1.05. Rye at 65 to 67 for State. Corn at for New York No. 2, August option, at 48¾@48¾c.; do. at 49c.; do., September option, at 45¾c.; do., October option, at 50¾c.; steamer mixed, August option, at 47¾@47¾c.; do., September option, at 48¾@48¾c. The spot lots included steamer mixed at 47@48c.; New York No. 2 at 48¾@49¾c.; New York No. 3 at 46¾@47c.; ungraded mixed at 46@49¾c. Oats, New York No. 1 at 34¾@34¾c.; New York No. 2 at 33¾@33¾c.; No. 2 Chicago at 34¾@34¾c.; New York No. 1 white at 37c.; New York No. 2 white at 34¾c.; white western at 33c. to 38c.; mixed western at 32c. to 35c.; white State at 34c. to 37½c.; mixed State at 32¾@34¾c.; New York No. 3 white quoted at 32¾c.; New York extra at 35¾@36c.; New York No. 3 at 31½c.

HOPS.—There have been no shipments this week, and trade otherwise has been slack. Emmet Wells says in his circular: "Our reports do not give promise of over 125,000 bales, or one-half of last year's yield. It will be a 'top crop,' which means a small crop of excellent quality. Now if growers will take the same pains in picking and curing that they did last year they will be well paid for their trouble. We do not look for very high prices, even though we grow less than half of last year's crop, for the reason that many of our large brewers are carrying a year's supply of '77s, which they took the precaution to buy at low prices, and therefore will not be compelled to come into market as early as usual. The crop in Wisconsin is reported to be almost a total failure; lice are destroying it. Advices from the Pacific coast are less favorable; rain is much needed there.

Quotations are for New Yorks, good to prime, 10@12c.; do., low to fair, 7@9c.; Eastern, 7@10c.; Wisconsin, 7@10c.; Yearlings, 2@ 3c.; Olds, all growths, 1@2c.; Pacific Coast hops, 10@12c.

HAY AND STRAW.—The new hay and straw is selling at from 40c. to 70c.; a larger portion of the parcels coming in are of poor quality. Prime old hay is wanted.

Bale hay, at 45@50c. for shipping, and 60@75c. for retail qualities; Straw quoted at 40@45c. for long rye; 40@45c. for short rye; and 30@35c. for oat.

Exports past week 136 bales. Since Jan. 1st, 40,975 do.; same time last year, 29,575 do.

LEATHER.—Prices are 19½@20c. for light hemlock; 19½@21½c. for middle; 20@21½c. for heavy and 17½@19c. for good damaged.

POULTRY AND GAME.—The supply of both live fowls and chickens is ahead of the demand, and prices are low and likely to settle further. Only choice hen turkeys wanted at this season. It hardly pays to pick out the specials that city killers will use, as buyers who have any sort of steady use for turkeys avail themselves of dry picked and other stock that comes from localities that make summer dressing a specialty. Ducks and geese are unchanged, chickens, N. J. 14c.; State 13c.; Western, 11@12c.; Southern 11@12c. Fowls—N. J. 12@12c.; S. & W., 11@12c.; Roosters, 5@6c. Turkeys 13@14c. Ducks—Choice, pair, 60@75c.; other 40@85c.; Spring 50@75c. Geese—Choice, $1.25@1.50; other 88c@$1.12.

Dressed poultry is in light supply, but prices favor buyers. Dry picked turkeys, 15@16c.; other, 13@14c.; spring chickens, Phila., 16@18c.; N. J. 15@16c.; S. & W. 12@13c.; Pa. fowls, 14@ 15c; N. J., 12@14c.; State and Western, 10@12c.

Woodcock have appeared; sales quick at 75@85c., pair. Eng. snipe, $1@2.25, doz. Wild gull-fed pigeons, from $1 25@1.37. Young, $1@1.12. Bay snipe from L. I. and the near waters will soon be in stock.

PROVISIONS have been tending upward, with an active trade. Mess pork quoted $10 50@$10 55 for spot lots; $10 45@$10 50 for August; $10 50@10 55 for September, and $10 65 for October deliveries. Bacon at 6¾@6¾c. for long clear. Lard—at $7 65@7 70 for spot lots; $7 65 for August, $7 65 September, and $7 70@$7 72½ for October delivery. Stearine at 9¼@9¾ for western, and 9¼@9¾ for city. Tallow at 6 15-16 for prime. Beef hams at $21 50. Beef—for extra mess, $11 75@$12; plain mess, $10@11 50; packet, $11 50@12 25 for bbls. and $16@17 for lcs.; family at $13@14; extra India mess, $19@20 for city brands; do. Philadelphia, $18@$19.

TOBACCO.—Larger export orders have been on the market, and the home demand has been very good, with prices steadier for the better grades, but not quotably changed for the better.

VEGETABLES.—Exports potatoes past week, 5,066 bbls. Supplies of potatoes have fallen off owing to late rains which have prevented digging; prices have advanced though not likely to hold: L. I. and N. J., Rose, $1.50@1.75; Culls, 50@75c. Sweet potatoes, Va., yellow, $4.50; red, $3@4.50. Receipts of garden stuff have been light and prices are temporarily higher. Green corn, sweet, per 100, $1@1.37; peas, bag, $1.50@$1.75. String beans, $1@$1.25. Cucumbers, 50@75c. per 100. Tomatoes, $1@$1.25. Irish, Onions, Chester red, $1@1.50 bbl.; N. J., $1@1.25; southern, $1. Marrow squash, $1.5 @$2.; crook-neck, $1.50@1.75; white, 75c.@$1 Beets, per 100 bun., $1; carrots do., $1. Egg plants, 100, $10@$12. Cabbages, Flat Dutch, $4@5; red, 6@7. Lettuce, bbl., 50@62c. R. Turnips, bbl., $1@1.25. Lima beans, bag; $3.

WOOL.—There is a strong market. Business is showing an improvement, particularly in western fleeces, California of the spring clip and Texas. Quotations are for domestic fleeces—

Ohio, Pennsylvania and West Virginia—XXX and picklock, 40@41c.; XX, 37@39; X, 37@38; No. 1, 37@39c.; No. 2, 34@37c; common, 31@33c.; combing and De Laine, 42@45c.

New York, Michigan, Indiana and Wisconsin. XX, 34@37c.; X, 34@37c.; No. 1, 33@33c.; No. 2, 31@33c. common, 28@31c.; combing and De Laine, 39@42c.

Iowa, Vermont and Illinois—X and XX 33@36c.; No. 1, 34@36c.; No. 2, 29@32c.; combing, 37@40c.

Missouri, Kentucky, and Tennessee—Washed fleece, 30@35c.; unwashed, 24@28c.; unwashed combing, 29@32c.

LIVE STOCK MARKETS.

Saturday, Aug. 3, 1878.

BEEVES.—Receipts for the week, 12,825 head; do., last week, 11,243 do. As receipts would indicate the market has been overstocked all the week, and prices have ruled weak and low every market day since our last. At the close the extreme is 10¾c., and that paid in only few cases: best steers sold, as a rule, 9¾@10c. For export cattle, 8½@9¾c. were quoted. Native steers ranged from 7½ to 9¾c. Texas and Cherokee ranged at 6@7¼c. State bulls, 2¾@2¾c.

COWS AND CALVES.—Not enough doing to base reliable quotations upon.

VEAL CALVES.—Receipts for the week, 3,437 head; do., last week, 3,107 do. Market fairly active at 5½@6¼c.: for ordinary to fair, extras, 6¼@6¾c. Grassers and buttermilk, 3@3½c.

SHEEP AND LAMBS.—Receipts for the week, 28,212 head; do. last week, 23,245 do. At the close sellers accepted lower prices to reduce the supply. Sheep ranged 3@4¼c.; lambs, 5¼@6½c.; quality of the latter in good order.

SWINE.—Receipts for the week, 18,506 head; do. last week, 19,042. Supplies go direct to killers. No city rate for live.

Reading for the Young.

A DEAR LITTLE GIRL.

GEORGE C. BRAGDON.

ONE fragrant and radiant day
There budded with blossoms of May,
Our May of the clustering curls—
The dearest of dear little girls.
How tiny the darling was then:
But now, only think, she is ten!
Ah me! How the swift seasons fly,
Like vanishing clouds in the sky!
But, well, as it has to be so,
Let's garner their joys as they go,
And put them down into our hearts
To lessen the aches and the smarts.
Let's romp with the dear little girls,
Like May of the clustering curls,
And shout with the dear little boys,
Like Claude of the clarion voice.
Let's gather them up in our laps,
And tell them the curious haps
And notions and fancies and fun
Abounding here under the sun,
And live our lives over again
In their lives—we women and men.

Oh ho! there are arms 'round my neck,
And my well-starched collar's a wreck;
And all over my face are the curls
Of the dearest of dear little girls;
And a pair of the reddest of lips
Is giving me nectarine sips;
And a voice murmurs whisperingly,
"Papa, tell a story to me;"
And because one has clearly been sold
For kisses, and ought to be told,
Repeating our sweet pantomime,
And commencing with "Once on a time,"
I invent her a fairly tale,
And give her a fanciful sail
On a gossamer boat of the sky,
From a harbor where cloud-lands lie,
Through space to a valley afar
In the west, on a glimmering star,
And stud it with rubies and pearls
For this dearest of dear little girls.

[*Rochester Democrat.*

HOW TO GROW PLANTS IN THE SUMMER FOR DECORATING THE ROOM OR WINDOW DURING WINTER.

JULIUS. J. HEINRICH.

THERE is rarely any surer test of a happy home than the flower-decorated window and neatly kept garden; and there is no occupation for the leisure hours better calculated to keep the home happy, or to sooth the mind. It yields pleasure without surfeit; the more we advance the more eager we become. How unlike this is to many of our employments! To those parents blessed with children, how delightful it is to bend their young minds to a pursuit so full of usefulness and intellectual instruction, combined with the advantages usually accompanying industry. As it promotes in children carefulness and thought about their plants, so it will lead to the same feeling respecting other matters.

Let me endeavor, therefore, by laying down a few simple and practical rules for the management of plants in the summer, for the room or window in the winter, to turn the children's attention or that of the female portion of the family, to this pleasing and innocent employment; for it is a subject calculated to give much more real enjoyment at far less expense than what are usually termed amusements.

As I intend and hope this may be for the benefit of young persons mostly, I shall exclude as much as possible all technical terms generally used in catalogues, and shall confine myself to the most simple expressions so as to make the subject easily understood.

FIG. 1.

The first thing to be attended to is procuring proper plants for the purpose; that is, plants which are healthy, strong and vigorous, as sickly plants in such situations would test the skill of the most experienced gardener to keep any length of time. The following list, although very small, contains those most suited for this

FIG. 2.

purpose, being easily obtained and not difficult to manage.

LIST OF PLANTS THAT WILL GROW IN THE SHADE OR WITH BUT LITTLE SUN.

No. 1. Dracænas (See Figs. 1 & 2.)
" 2. Ferns.
" 3. Lycopodiums.
4. Marantas.
5. Nemophilas.
6. Tradescantias.

PLANTS THAT GROW BEST IN THE SUN.

No. 7. Alyssum.
" 8. Begonias.
" 9. Bouvardias.
" 10. Carnations.
" 11. Callas.
" 12. Cannas (See Fig. 3.)
" 13. Centaureas.
14. Geraniums, Zonal.
15. " Scented.
16. Lobelia.
17. Mignonette.
18. Nasturtiums.
19. Primulas.
20. Pansies.

FIG. 3.

Plants intended for decorating the room or window during the winter, should not be planted in the garden borders or beds in the summer. If you plant them in the soil, and take them up in the fall and pot them for winter use, you will find that all the leaves of the plant will drop off, and in a few weeks you will have only the stalk left. It will be some time, and, in fact, almost all winter before they will recover. To prevent this,—and now is the time after selecting your plants—pot them in as small a pot as you can possibly get them into without crushing the roots too much, and plunge, bury or set the pot into the garden-border or bed, up to about one inch from the top of the pot, as shown in Fig. 4. Be careful not to fill the pots with soil when you plunge or bury them, because you will have to water them as if on a stand; but by burying them, they require less water. Later on, about the first or second week in August, they should be taken up and knocked out of the pot, to see if they are full of roots. If full, the plants must be repotted into a pot a size or two larger, in order to give them more room and nourishment. Repotting is much better than watering with guano water, as guano is a very heating fertilizer, and very dangerous. It may destroy more plants in a few hours than weeks or even months of care can replace. Plants treated in this way will answer the double purpose of decorating the garden in summer, and when Jack Frost comes, you need only to raise the pot and you have the plant, roots and all, in perfect order, ready to decorate the room in winter. Should the season be very mild in September, and allow you to leave them out late, give them, about the end of September, another repotting, which will carry them nearly through the winter.

FIG. 4.

Plants of almost every kind given in the above list, can be bought at the greenhouse of any florist, if not just now, later on, as they generally grow them for this purpose. For those who wish to grow such plants, they need only to adhere to the following rules:

Nos. 5, 7, 16, 17 and 20, must be grown from seeds later on (directions, etc., will be given in these columns in due time.)

Nos. 13, 14, 18 and 19, may be grown from seed sown now and also later on.

Nos. 2, 3, 4, 6 and 12, can be grown from division of the roots now.

No. 1.—Plants must be bought, though they may be grown from seed, but it takes some time. I have a few hundred growing from seed now in my window, sown on the 22d of last April, and they are only 1½ inch high.

Nos. 6, 8, 14 and 15, must be grown from slips or cuttings, and so may many very fine varieties of No. 18.

With regard to Nos. 9 and 10, it is best to buy plants later on, as they do not root well this warm weather, and they take some time to make good flowering plants.

No. 11.—If you have an old plant you can get plenty small bulbs from it. Repot it, and start it to growing at once, or else buy a plant later on.

The best way to grow Nos. 6, 8, 14, 15 and 18, from slips or cuttings is this: take a dish or tin pan from two to four inches deep, fill two-thirds full of fresh-water or river sand—no salt-water sand—wet this well with water; then make your slips taken from the end of the plant, green, young wood, about three inches long; cut off all the leaves except the small, young leaves at the end; make holes in the sand large enough to allow you to put the slip in; put in your slips about one to one and a half inches apart each way, and about half the depth of the sand, so as to leave about three-fourths to a inch of sand from the end of the slip to the bottom of the pan; now water them well through a fine rose watering-pot, and place them in the shade, and do not let the sun or wind get at them; use plenty of water to keep them saturated; as soon as they have rooted, pot into small 2½ inch pots, and shade well from the sun; later on repot as required.

To grow Nos. 13, 14, 18 and 19, from seed: take boxes of any length or width you like, but only four inches deep; fill each box three inches deep with light, sandy, rich soil; sow your seeds in rows about three inches apart, and cover with just enough soil to bury or cover the seed; water them now well through a fine rose watering-pot, and place them in a sunny situation, but do not forget to water them when they get dry. When the plants are large enough to handle, pot into small pots and water well, and shade from the sun until rooted; later on repot as needed.

The Puzzler.

HIDDEN METALS.

1. LET me plead his cause.
2. Why brag, old Dan?
3. Four zebras sank in the river.
4. They left the grass-plat in a muss.
5. On the banks of the Sil, verdure grows.
6. Put the ticket in your pocket.
7. No sir! on my honor.
8. Haste, Ella, or you'll be too late.
9. As best ushers cost little, they abound.
10. The cop perceived the robber.
11. I had the pew termed unsafe.
12. In the Hebron Zenobia bathed.
13. His initials were "R. Z." in Coptic.

☞ Answer in two weeks. BALTO.

FRACTIONAL PUZZLE.

1. TAKE one-quarter of crow. 2. One-tenth of kingfisher. 3. One-eighth of bobolink. 4. One-sixth of magpie. 5. One-seventh of lapwing. 6. One-ninth of goldfinch. 7. One-eighth of woodcock. 8. One-eighth of paroquet. 9. One-quarter of swan. 10. One-sixth of linnet. 11. One-eighth of starling. 12. One-seventh of vulture. Take one from each and form a bird.

☞ Answer in two weeks. MAY.

CENTRAL PUZZLE.

AN army officer; an animal; a pattern; signified; a mechanic; damp; fine rain; a town of Georgia; income; a walrus; Indian corn: an Irish poet: a moving power. Centrals form a Bible traitor. LITTLE ONE.

☞ Answer in two weeks. S. C.

PUZZLER ANSWERS.—July 20.

ANSWER TO TRIPLE ACROSTIC.—Primals, Pepper; Centrals, Ginger; Finals, Nutmeg.

ANSWER TO MOUNTAINOUS ENIGMA.—"The happiness of life is made up of minute fractions:—such as a loving kiss, a smile, a kind look and the countless other infinitesimals of pleasant thought and feeling."

Sabbath Reading.

RESIGNATION.

I WAS not patient in the olden time,
When my unchastened heart began to long
For bliss that lay beyond its reach; my prime
Was wild, impulsive, passionate, and strong.
Heaven-sent, to come and nestle in my breast;
I could not realize how time might prove
That patient waiting would avail me best.
"Let me be happy now," my heart cried out,
"In mine own way, and with my chosen lot;
The future is too dark, and full of doubt,
For me to tarry, and I trust it not.
Take all my blessings, all I am and have,
But give that glimpse of heaven before the grave!"

Ah me! God heard my wayward, selfish cry,
And taking pity on my blinded heart,
He bade me the angel of strong grief draw nigh,
Who pierced my bosom in its tenderest part.
I drank wrath's wine-cup to the bitter lees,
With strong amazement and a broken will;
Then, humbled, straightway fell upon my knees,
And God doth know my heart is kneeling still.

I have grown patient; seeking not to choose
Mine own blind lot, but take that God shall send,
In which, if what I long for I should lose,
I know the loss will work some blessed end,
Some better fate for mine and me than I
Could ever compass underneath the sky.

[*All the Year Round.*

TEMPERING THINGS.

OBSERVE the pains taken with the temperature of the globe. See how the earth has its shores cooled and bathed by the sea and air; its surface so graded that the rains shall neither rest on it too long nor run off it too speedily; the strata are so tipped that the water gushes out, here and there, in cool springs; the mountains and hills are so arranged that the rivers meander to and fro over the surface of each continent, fertilizing and connecting all parts; mountains rise in the heated tropics, carrying the land up into cooler regions, catching the sea-breeze, and compelling it to deposit its burden of water in daily and nightly showers. Great masses of ice at the poles set in motion currents in the ocean and atmosphere rolling down toward the equator, and bringing perpetual reinforcements of cool water and cool air. Clouds sail to and fro—great ships of heaven—going about their Master's business, carrying water from one part of the continent to the other; carrying also a freight of electric fire from where it is in excess to where it is needed. So they do the work of a mercantile navy; and sometimes, too, they meet in battle, like ships of war, and we have a terrific naval engagement, with awful discharges of lightning and rolling thunder, yet not to destroy life but to save it. Such pains are taken to keep the earth in good temper, with equal balance of hot and cold, moist and dry. So, too, when the aurora borealis appears in the heavens, it is not merely to delight us with its beauty. Use always lies under the beauty, as the skeleton beneath the outward human form. Those steady discharges of auroral light to the zenith along innumerable conducting lines come, it is thought, to equalize the electric conditions of the air. As the engine blows off its excess of steam, so the earth is blowing off its excess of electricity, and tempering its climate for human use.

If God takes such pains to temper the climate of the earth on which our bodies live, does he not also temper the climate for the soul? Let us trust in his providence; let us believe that the events of life, its trials and disasters, its varied experiences, come, not blindly nor by accident, but are sent to give the right temper to our moral and spiritual nature, to fit us for the work we have to do in time and eternity.

The word temper is applied to the manufacture of steel. To temper steel exactly is the difficult point, and even the cutlers themselves do not know how they do it; they see something in the look of the steel which shows them that it is of the right temper. The utmost care, the most delicate and constant attention, are necessary in that ancient and wonderful process by which iron imbibes carbon and turns to steel. The smallest crack in the side of the furnace vitiates the results. Day after day the fire rages in the heart of the shut trough, and there the work goes on. So the steel gets its proper temper, whether it is to be a razor, a coach-spring, or a file.

And does not God take as much care to temper us as the steel manufacturer in Damascus or Sheffield takes of his knives and sabres? We also are often put into a raging furnace, and there, amid the stern experiences of life, we lie in the fire to be tempered, and go under the hammer to be compacted for the work we are to do in the universe. One is to be made into a delicate instrument, like a razor; another into a hard one, like a file; and each needs to be brought to a different temper. So, too, has our nation been tempered in the fire and furnace of war, and since then in the financial disasters of peace. We have gone under the heavy hammer blows of disaster and ruin. We need to be tempered. We have been going into excesses of self-love, into aberations of egotism, which are destroying our national life. We have been intemperate in our self-love. We have forgotten to worship God with reverence, to love man with tenderness. We need to be tempered again, and our great war and all the subsequent evils have been sent to do the work.—*Rev. James Freeman Clark.*

IT is dangerous to love to be wise above what is written; to be curious and unsober in your desire of knowledge, and to trust to your own capacities and abilities, to undertake to pry into all secrets, and to be puffed up with a carnal mind. Souls that are thus soaring above the bounds and limits of humility, usually fall into the very worst of errors.

PERSONAL ITEMS.

It was Mr. Augustus Braham who wrote "Though lost to sight, to memory dear."

Ex-Governor Seymour is refusing invitations to speak at agricultural fairs this season, on account of the uncertain state of his health.

Ex-Senator Revels of Mississippi, who is now pastor of the African Methodist Church at Richmond, Ind., has had a stroke of paralysis.

Dr. Lemoyne, of Pennsylvania, who owns the fiery furnace in which people are cremated, has given $20,000 to a colored school in Tennessee.

Miss Abigail P. Smith, one of the Glastonbury, Conn., Smith sisters, widely known for their resistance to taxation without representation, died lately, aged eighty-two years.

With more than French politeness, Marshal Bragney, who died recently, shortly before that event, addressed cards to his friends with the letters P.P.C.—*Pour prendre conge*,—to take leave.

The Duke of Sutherland, who owns a million acres of land in Scotland, has obtained leave, his heir consenting, to disentail his estates in that country. They have been in the family five or six centuries.

General Butler says that he turned over all of Gen. Twigg's plate, down to the last spoon, to the Quartermaster's Department, and has the receipt for it. What became of it subsequently the General does not know.

Isaac Cohen, who brandished his flambeau nose at the head of the Washington rioters, is a German-born machinist, of thirty-five years, a recent Arkansan importation, and at Hammond's revival excitement he worked earnestly for the saving of souls.

Dennis Kearney, the notorious agitator, in personal appearance is rather short and stout, clean-shaven, with the exception of a moustache, which is of light color. He has the true Hibernian cast of features, neither repulsive nor yet attractive.

Old Peter Goelet, the rich but stingy New York bachelor, who is rated at ten millions, is idling away the summer days at West Point, farther than which place it is thought he has never ventured from the metropolis, the scene of his wealth.

Lord Beaconsfield will receive from the British residents of California a $1,500 silver brick, mounted in native wood—a first-rate way of letting Disraeli know that he's considered a "brick" on this side as well as a Sir Knight of the Garter on the other.

Bismarck says that the French must have some nation to hate. By the way, he has just cut off the full beard that disguised him from would-be-assassins during the winter, and now "sports" only the moustache known to all—but this nature has lately dyed white.

There is a story of love that smacks of the olden time. It is that the son of General Sherman was deeply enamored of his fair cousin, now Mrs. Don Cameron. He clung to his hope until the last moment, and then abandoned the world to devote his life to the Brotherhood of Ignatius.

The Hon. Hamilton Fish held the office of Secretary of State three or four days longer than any of his predecessors, Madison, Adams and Seward being the three who filled the position the longest before him. Mr. Fish is now living at Sea Girt, on the Jersey coast, and says he has dropped politics and become a farmer, in proof of which he shows hard blisters on his hands.

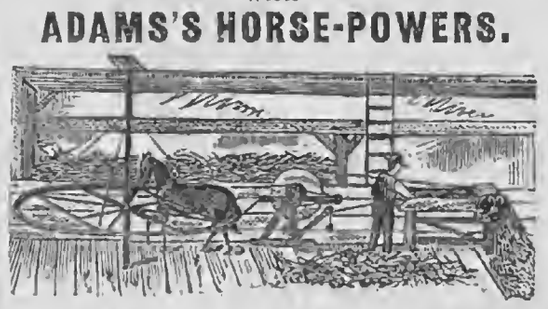
The engagement of Mr. Isaac Bell, Jr., of New York, to Miss Jeannette Bennett, the sister of James Gordon Bennett, is not of very recent date. Mr. Bell has long known Miss Bennett, but has never shown her marked attention until very recently, when he spent the last few weeks with Mr. and Miss Bennett in Europe. The groom-elect is twenty-nine years of age and a cotton merchant. His father is a prominent citizen of New York. Miss Bennett is six years younger than her future husband, and is now with her brother at Newport. The date of the marriage, which is to be a grand affair, is not announced.

General Garfield goes about his farm in a broad-brimmed chip hat, with his trousers tucked in a pair of stout cowhide boots, giving directions to his hired men, and lending a hand at the haying and harvesting. None of his Washington friends, should they see him driving a yoke of oxen in the broiling sun and emphasing with a gad the stentorian shouts of "Gee," "Haw," and "Whoa, Buck!" without which no oxen seem able to do a proper amount of work, would have suspected that the broad-shouldered, sun-burned farmer under the chip hat, was the the famous Republican chief, fresh from parliamentary victories on the floor of Congress.

The betrothal of the Duke of Connaught and Strathearn with Princess Marie Louise of Prussia, daughter of Prince Frederick Charles, has been formally announced in the House of Commons by Sir Stafford Northcote, Chancellor of the Exchequer. The Duke of Connaught is the third son of Queen Victoria, and was born in Buckingham Palace on the first of May, 1850. His full name is Arthur William Patrick Albert, Duke of Connaught and Strathearn, Earl of Sussex, Duke of Saxony, Prince of Coburg and Gotha, K. G., K. T., K. P., G. C., M. G. He has attained the military rank of major. Upon attaining his majority in 1871, he was granted £15,000 a year by Parliament. The duke's betrothed, Marie Elizabeth Louise Frederique, is the daughter of Prince Frederick Charles Nicholas, the only son of Prince Charles, younger brother of the Emperor William of Prussia, and was born on the fourteenth of September, 1855. Her father is one of the most distinguished soldiers in Europe, and was the commander of the second army in the Franco-German war, and as such compelled Marshal Bazaine to surrender Metz.

Implements and Machinery.

Farmers' Cut Feed Stormy Days
WITH
ADAMS'S HORSE-POWERS.



When used on barn floor a 15 year old boy can set-up, operate, and put it away alone. Occupies no useful room when not at work. Safest, most durable, most convenient and cheapest power made. Send for Circular. ☞ Responsible Agents Wanted.

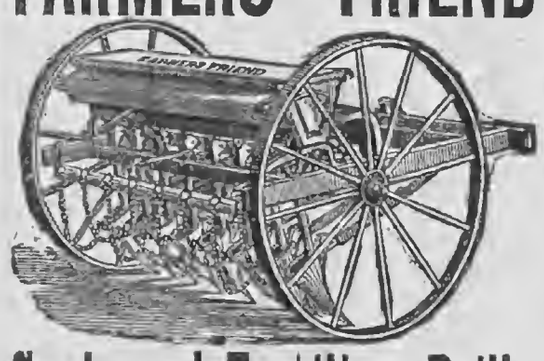
FARMERS FRIEND



Grain and Fertilizer Drill.
The quantity is regulated with gear-wheels in a CONE, so there are no loose wheels or movable feeders, and it will sow any grain perfectly and accurately.
It has the best Spring Hoe, and every Drill has a Force-Feed Grass-Seeder, Patent Shifter and Surveyor free.
Illustrated Catalogues, with description, prices and a Full Centennial Report sent on application. Agents wanted in unoccupied territory. Address, stating where you saw this notice.
FARMERS FRIEND MANUF'G CO.,
DAYTON OHIO.

THE McSHERRY

Force Feed Grain Drill
Is the Machine upon which you can always depend. It is very easily regulated and managed, and possesses every requisite of a perfect Grain Drill. Years of successful use, without change of feed arrangement or any essential part, with its constantly increasing sale, prove in arguments stronger than words that it is the best and most satisfactory Drill to buy.
It sows Fertilizers splendidly.
The McSherry Drill received Highest Awards at the Centennial.
Send for Pamphlet. Mention this paper in your letter. D. E. McSHERRY & CO.,
Dayton, Ohio.

Sold on trial and guaranteed cheaper, at its price, than any other Hay press as a gift or no sale. Don't be swindled by irresponsible manufacturers of infringing machines, as the purchaser is liable. It costs no more for a good press than an inferior or worthless one. Address, P. K. DEDERICK & CO., Albany, N. Y

CORNELL'S A B C
THRESHER AND CLEANER.

This Machine runs 20 per cent. Lighter than any other Thresher and Cleaner in the market, and does MORE and BETTER work with the same amount of power. The sizes are from a 22-inch cylinder for a One-Horse Railway Power to a 36-inch cylinder for a Six-Horse Lever Power. Write your name, Post-Office, County and State, plain, and address
ALBANY AGRICULTURAL WORKS,
O. H. P. CORNELL, Proprietor. ALBANY, N. Y.

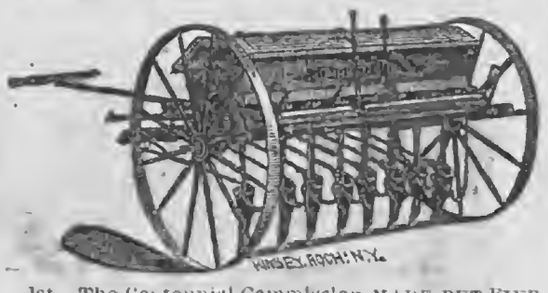
C. WADE, Battle Creek, Mich.

Implements and Machinery.

FACTS FOR FARMERS.



1st.—The Centennial Commission MADE BUT FIVE AWARDS to Grain Drills and Fertilizer Attachments.
2d.—Of these five, TWO were given Bickford & Huffman. One on the FARMER'S FAVORITE and one on Fertilizer Attachment.
3d.—NO OTHER MANUFACTURERS RECEIVED AN AWARD ON A FERTILIZER ATTACHMENT!
4th.—The award to the "Champion," built by Johnson, Gere and Truman, was "for a machine with attachable manure distributer;" an implement they did *not* exhibit and *do not offer for sale*, as their "manure distributer" is neither "attachable" nor detachable. The report does not commend this drill or its "manure distributer," for a single quality of work.
5th.—The award to the Farmer's Friend pronounces it defective by saying it *is capable of further improvement, as regards delivery up and down hill*; and also to the McSherry drill in these words: "*Some further adjustment appears desirable to enable this drill to deliver with equal equality up and down hill.*"
6th.—The Empire, Buckeye Hoosier, Superior and Hagerstown drills were *refused* EITHER AWARD OR REPORT, because of great "irregularities" or "variations" in the tests.
7th.—The variation of our nearest competitor. The Champion, *from its own distribution*, was MORE THAN 237 PER CENT. of that shown by the FARMER'S FAVORITE.
8th.—The award to the FARMER'S FAVORITE, distinguished it by commending it for "ACCURACY OF DELIVERY, AND REGULARITY OF DISCHARGE UNDER DIFFERENT CONDITIONS," and "REGULARITY OF DELIVERY UNDER ALL CONDITIONS." Qualities conspicuously lacking in its competitors.
We challenge contradiction of a single feature of the above statements.
Fully 80 per cent. of all the Fertilizer drills in use on the American Continent are built under our patents,—a fact that tersely and undisputably establishes superiority. For circulars, prices or information see our agents, or address Bickford & Huffman, Macedon, N. Y.
S. N. GALLUP, Genl. Agt.

THE PARKER GUN.

THE OLD FAVORITE. No gun in the world has a better record for close, hard shooting, and none will stand more hard service. AN AMERICAN GUN FOR AMERICAN SPORTSMEN. Send stamp for circular to PARKER BROS., Meriden, Conn., 97 Chambers Street, New York.

Wit and Humor.

WARM WEATHER POETRY.

Oh, for a lodge in a garden of cucumbers!
Oh, for an iceberg or two at control!
Oh, for a vale which at midday the sun cumbers!
Oh, for a pleasure trip up to the pole!

Oh, for a little one-story thermometer,
With nothing but zeroes all ranged in a row!
Oh, for a big double-barreled hygrometer,
To measure this moisture that rolls from my brow!

Oh, that this cold world were twenty times colder!
(That's irony, red-hot, it seemeth to me.)
Oh, for a turn of its dreaded cold shoulder!
Oh, what a comfort an ague would be!

Oh, for a grotto to typify heaven,
Scooped in the rock under cataract vast!
Oh, for a winter of discontent even!
Oh, for wet blankets judiciously cast!

Oh, for a soda fount spouting up boldly
From every hot lamp-post against the hot sky!
Oh, for a proud maiden to look at me coldly,
Freezing my soul with a glance of her eye!

[Old Wail, revived by St. Louis Journal.

How to remove weeds.—Marry the widow.

AT the depot the other day, a young man put his head out of the car window to kiss his girl good-by, when the train pulled out so rapidly that he kissed an old African female at the next station.

CONUNDRUM by Archimedes Johnson: "Why do de colored man always attrack mo' attention from assemblages ob people den the white brudder do? Gib her up? Kase the colored gemleman is always de center of the group!"

Who is it with funeral thread
Comes slowly home and goes to bed,
And utters what is best unsaid?
'Tis he who's fished since rose the sun,
Subsisting on a single bun,
And after all's caught nary one.

[*N. Y. Forest and Stream.*

A MAN who was not clever at conundrums, in attempting to get off one at a tea party at his own house, became exceedingly mixed. He intended to ask the old question, "Why is a woman like ivy?" the familiar but gallant answer to which is, "Because the more you're ruined the closer she clings." But he put it, "Why is ivy like a woman?" which none of the ladies could tell, and so the unfortunate man told them himself that it was "Because the closer it clings the more you're ruined."

A HEAVY LOAD OF CARE.—A little girl in the church at Ashland, Va., has been one of a band of workers to raise money to complete the church building. She had earned by her own work a considerable sum for a child, when a friend heard her express a great desire to own a canary bird. It was suggested to her that she could easily purchase one from her own purse. "Oh!" she replied, "I can't got a thing for myself while I have that church on my shoulders.' —*Charlestown News.*

WHERE it is going to stop no one knows. Before "Grandfather's Clock" is fairly run down, a music publisher advertises "Grandmother's Chair," and no doubt these will be followed by "Grandmother's Spectacles," and "Grandmother's Sun-bonnet," and "Grandfather's Bootjack," and "Grandmother's Candlestick," and all the other rubbish that once belonged to the old folks, and was not disposed of at public sale thirty years ago.—*Norristown Herald.*

Clear the Way.

FOR the escape from the system of its waste and debris, which, if retained, would vitiate the bodily fluids and overthrow health. That important channel of exit, the bowels, may be kept permanently free from obstructions by using the non-griping, gently acting and agreeable cathartic, Hostetter's Stomach Bitters, which not only liberates impurities, but invigorates the lining of the intestinal canal when weakened by constipation or the unwise use of violent purgatives. The stomach, liver and urinary organs are likewise reinforced and aroused to healthful action by this beneficent tonic and corrective, and every organ, fiber, muscle and nerve experiences a share of its invigorating influence. Unobjectionable in flavor, a most genial and wholesome medicinal stimulent, and owing its efficacy to botanic sources exclusively, it is the remedy best adapted to household use on account of its safety, wide scope and speedy action.

ONLY TEN CENTS FOR ONE YEAR.

The *best made* and most elegant cases in market.

No shoddy ornaments used—*nothing but solid wood. Every Organ fully warranted for five years.*

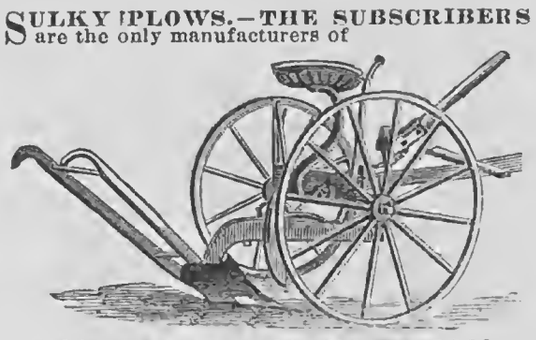
Write to us for Illustrated Catalogue and Price List, which will be mailed postpaid on application. Address

LORING & BLAKE ORGAN CO.
Worcester, Mass., or Toledo, O.

I HEREBY WARN THE PUBLIC that the machine advertised by Geo. Ertel as the Economy Hay Press infringes and uses eight of my patents, and that said press was copied from my designs on the records of the Patent Office, or from my machines in the field, and that they are thus a swindle upon the public. Either the maker, seller or user are liable, and as the damage for infringing so many patents will be large, I propose to prosecute the latter as usually the most responsible party. Moreover, the damages are largely occasioned by the defective operation of such inferior machines, distortions of my patented designs; and the dirty ragged bales they put upon the market being my patented form of bale, not only prejudices my interests seriously, but also damages the entire hay interest of the country, as it will ruin the reputation of the Perpetual Press and bale, which means several dollars less per ton of hay. Formerly Western Hay was at a discount and but little called for in Eastern markets, but the Perpetual Press has opened up the markets of the entire country to the Western farmer and shipper, and the bales from these presses are now found and sell at an advance in all Eastern and Southern markets; no one questions that it is the Perpetual Press that has done all this, then why prostitute its reputation to the detriment of all concerned? The damages for infringing so many patents will be sure to cost the purchaser more than the press, and its use will be stopped. Why join in such a steal when you can purchase the same machine of me, the inventor, at the same prices, and with such improvements as to make them do good work and sustain the reputation and prices of the Perpetual Hay in the market? Parties who appropriate the inventions of others seldom originate anything themselves further than attaching some little side trap to the machine they pirate in order to get a patent on the side trap and make the public believe it is on the machine proper. Said Ertel copied the machine in question bodily, and the patents he claims are not on the machine proper but on little traps attached to a feed door and the pole of the truck, neither of which could be utilized on a perfect press, and he has no authority to use my patented press to apply his side trap. I am not a novice in presses and patents, but have had a life experience and am prepared to satisfy all interested that I am entitled to all I claim, and, having the ability to do so, shall protect my property to the interest of the public and myself. Do not regard this as a snare as I volunteer to furnish evidence to satisfy all upon application that the above is a statement of facts, and in all fairness I ask the public if I am not entitled to some consideration for my improvements and the benefit they have been to the hay interests of the country. Parties having these contraband presses will not be allowed to use them unless they settle with me, and, in addition, apply such of my improvements as are required to make them do good work, and turn out bales that will not sell at a discount, thereby damaging the sale of our patented bale in the market. Don't be swindled, but send to me for copies of my patents before purchasing any horizontal hay press. Price of presses guaranteed the best in the world, and cheaper at prices than any other as a gift or no sale, from $150 upwards. Send for illustrated price list.

ADDRESS P. K. DEDERICK, Albany, N. Y.

SULKY PLOWS.—THE SUBSCRIBERS are the only manufacturers of



OSBORN'S SULKY PLOW,

the only Plowing Machine that has proved a perfect success in all kinds of soil. Any kind of plow can be attached. The plowman rides and handles the plow with ease, regulating the depth and width of furrow. The draft for the team is materially less, and the ordinary laborious mode of plowing is reduced to one of comfort and ease.

THE STONE PINE.

PINUS CEMBRA.

It is specially necessary to give the botanical name in this case, as there is another Pine, Pinus Pinea, which is also termed the Stone Pine. This last, however, is an Italian Pine, and not hardy far northward in Europe, and not at all in the Northern States of America. The Stone Pine we have in our illustration, Pinus Cembra, is sometimes called the Swiss Stone Pine. It does well all over Europe, but is quite peculiar to the Tyrol and the Alps, where its large seeds are, in sections, used as an article of food. Probably the longest known and most special home of this Stone Pine is, however, Siberia, whence the name Cembra, Cimbria being the ancient name for all countries in the regions about Siberia. Loudon calls it the Siberian Stone Pine for similar reasons, but it is very generally known in America and Europe as the Swiss Stone Pine, or simply the Stone Pine. We dwell on these facts to prevent confusion that might otherwise readily occur. The Swiss Stone Pine is a very distinctive tree in its habit. It is erect, and of a bluntish, pyramidal shape, regularly furnished with branches down to the ground, thickly clothed with foliage, and attaining a hight of fifty feet. Much variation appears in its form, as seen in different specimens. Sometimes it becomes so erect in habit as to be perfectly conical. Again, the branches will be quite horizontal in their growth. Grafting may be used very profitably in such case to perpetuate desirable forms. There are in use, at the present time, several varieties of Pinus Cembra, not results of the propagator's art, exerted in selecting from sports in the nursery, but all apparently sports growing under the peculiar conditions of different countries, such as Cembra pygmæa, Helvetica, Siberica, monophylla. There is also a variegated variety of Cembra, of which we do not know the value. Scarcely any variegated Pine, except Pinus Massoniana variegata, has endured successfully American suns, so the chances are against the success of Pinus Cembra variegata. For all lawn planting purposes, the Swiss Stone Pine is essentially a low-growing tree. A dozen years will hardly increase its dimensions beyond the ordinary requirements of a village lot. Its pyramidal form and rich blueish-green color, make it very effective, when grouped among other dwarf evergreens, or standing alone in a favorable position to exhibit its peculiar beauty. In a group it should be placed somewhat in the rear, and, as a single specimen, it may be best used in small grounds in the corners. For all kinds of ornamental planting, the Swiss Stone Pine ranks very high, affording a marked individuality of form surpassed by few other trees. Though so old and well known, its appearance on the lawn is sufficiently uncommon to render it as yet decidedly novel to most people. It is hardly a rare, but certainly a very choice tree.

Horticultural.

NOTES FROM THE RURAL GROUNDS.

AN EXPERIMENT.

Arbor-vitæ hedges are not planted for the purpose of turning animals. At least they cannot be trusted to do so. We do not see, therefore, what good is derived from setting the plants so near each other as authorities instruct us to do. If Arbor-vitæ be set one foot apart, they will do well for several years. But, finally, the roots become crowded, and, as it were, pot-bound; the leaves and branches receive too little sun and air, so that sections of the hedge, or single plants or parts of single plants, will be killed by the first severe drought or exceptionally cold winter. For the purpose of ascertaining how far a single Arbor-vitæ could be made to extend over the ground, one was planted upon the lawn five years ago, and has since been cut back every season to within a foot or a little more of the ground. Its diameter is now six feet. Why not, therefore, in starting hedges set the plants, say, at least four feet apart? Or, if the effect of a continuous hedge is needed sooner, plant them two feet apart, and then when the branches meet, remove every other plant for the formation of another hedge, leaving now a space of four feet between those of the first?

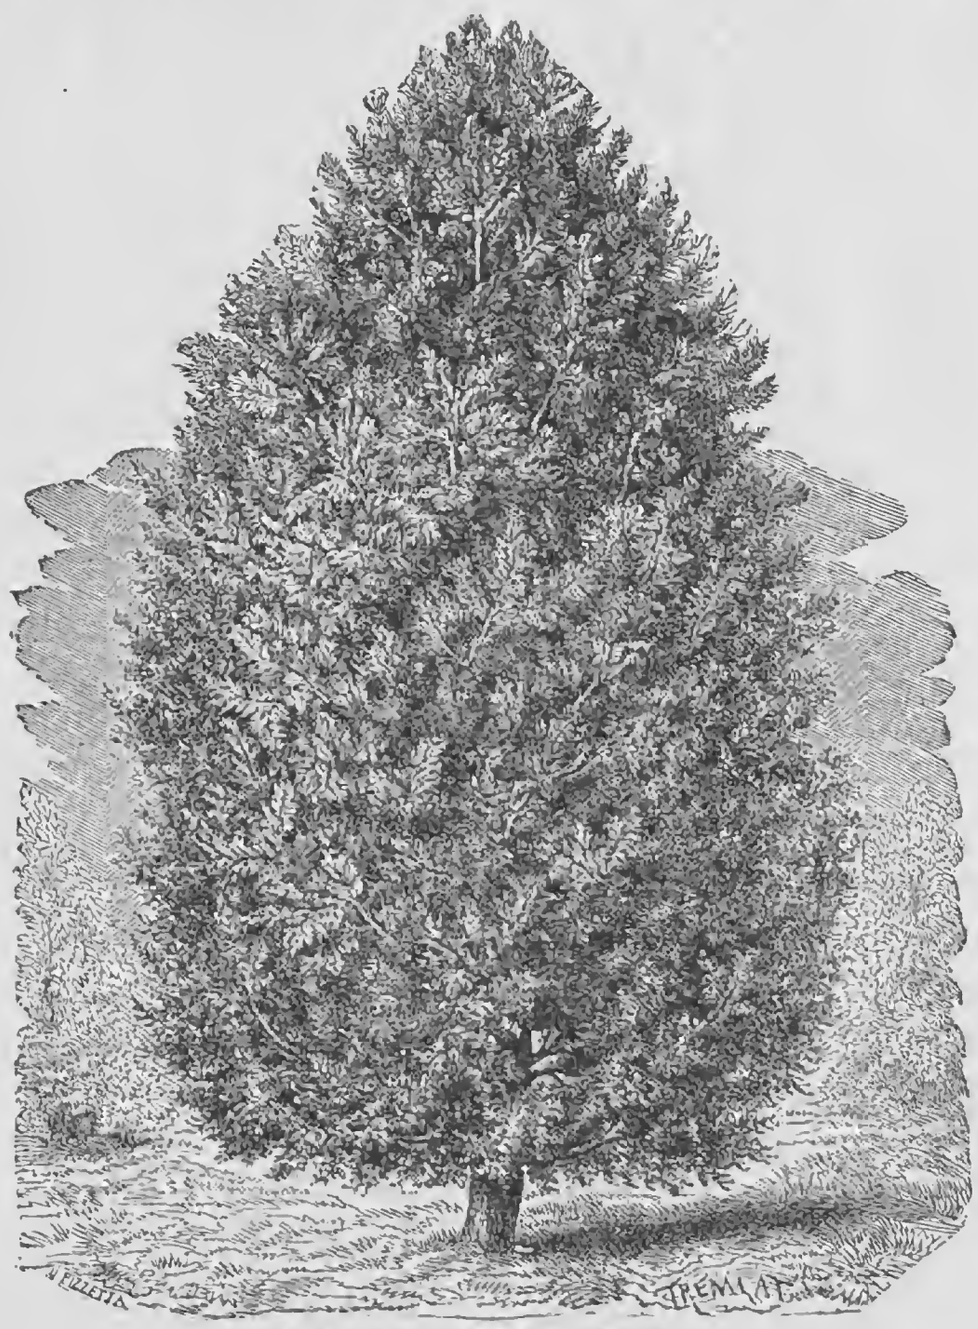
Ornamental evergreen hedges are seldom so ornamental as they might be if more care were given to the lateral and less to the perpendicular growth. Looking to permanent health and beauty, the plants should be set as far apart as we have indicated; should be kept cut back to two feet until the lowest branches meet and lie upon and cover the ground. Then they may be permitted to attain the desired hight. But the lower growth, which has been sacrificed to perpendicular growth, is sacrificed for all time, and that which would form a chief beauty is lost forever.

ORNAMENTAL VEGETABLE GARDENS AND FANCY BEETS.

We wish our readers might see our Fancy Beets. They were sent here by Messrs. Thorburn & Co., the old and trustworthy seed merchants of New York, for trial. Knowing that they were not to be cultivated for the roots alone or mainly, but for the leaves, the young stalks as large at the base as the half of one's wrist. The veinlets are also a purple scarlet, which contrasts showily with the wax-like colors of the blades. Some of these stalks and veins are a deep orange, some pink, some light green ("White-Ribbed") with all intermediate shades.

As a general thing very little care is bestowed upon the vegetable garden to make it ornamental as well as serviceable, and perhaps this is as it should be; but we have never known until this season with how little trouble it can be made the one as well as the other.

The back boundary of our garden is shown by a line of dwarf peaches, plums and crab-apples. On one side are rows of Kittatinny Blackberries and all sorts of red and black Raspberries. On the other side, concealing the fence, are seedling hardy shrubs of various sorts. The main paths are lined with Currants and Gooseberries. For want of space elsewhere this season, we were driven to plant a double row of Ricinus seeds across the entire width of the garden—a variety produced by crossing Ricinus Gibsonii with R. sanguinens. These are now about two feet high and the leaves present changeable shades of bright, shiny crimson. Water and Muskmelons, groups of different varieties of Corn, Pearl Millet, Celery, planted in lines as straight as possible, Tomatoes of many kinds well-staked, Cabbages, Brussels Sprouts, Green Peas, planted late which, by the way, we have never found of any value; parsnips, Chufas, Okra, Salsify which, again by the way, is worth its weight



SWISS STONE PINE.

plants were taken from the seed-beds and strung along the borders of the vegetable garden. They are now curious and beautiful. The leaves of the variety marked "No plus ultra" are of a deep purple or plum color, and small as compared with the others. Those of "Scarlet-ribbed" are, many of them at least, two feet long—we speak of the blades—with scarlet midveins and in any other vegetable; twenty-five rows of different strawberries, many different kinds of Lettuce, fill up the intervening spaces.

These plants are irregularly divided by main paths into several plots, and some of these plots, on one side, are bordered with the showy Beets of which we have spoken. The entire garden so planted and arranged is singularly attractive, and the members of the family, as well as our visitors, linger in this part of our grounds longer than in those parts which are nothing if not ornamental. Thus a pleasure has been created from this style of mixed gardening, that repays us far beyond its cost and settles us in the belief that the vegetable garden need not be a bald vegetable storehouse alone, to be resorted to only as the demands of the table render it necessary.

But we have yet a word to say about the Fancy Beets. Though highly ornamental, they are useful too. We have found that the great midribs, divested of the green parts and secondary veins, may be cooked and served in a variety of ways. They may be cut up into pieces, stewed as long as necessary and covered with spiced vinegar; or they may be stewed and dressed with drawn butter as for Asparagus. For other particulars see Domestic Economy next week. We claim this as a new and valuable dish.

Aug. 6.

GARDEN TALKS AND WALKS.

The Beeches, Mass., July 30, 1878.

FARMING V. CITY LIFE.

G. F. M. was brought up in Jersey City, where for some years past he has been an active member and partner in a business firm. He always had a longing for country life, particularly as a small-fruit culturist. Though practically and theoretically ignorant of the fruit-farming business, he was nevertheless determined to engage in it, and as a preliminary step he took last year's (77) course in botany at Harvard University and in this he distinguished himself as one of the brightest and best students of his class. Practically this step, though eminently useful was not imperative, but it strengthened his purpose, vitalized latent interest, and displayed undreamt of charms in his coveted avocation. Last spring he leased a small farm in N. J. some 24 miles from New York, and on the first of April practically entered upon the duties of the business of his choice. Knowing as I did his keen business capacity and indomitable perseverance, I had no fears for his success, providing he could overcome being "lonesome." The following extracts from a letter I had from him a few days ago justify my confidence.

"I put in one acre of strawberries and will set out two acres more next spring. I set two varieties, Seth Boyden's No. 30. and Great American. I also put in 400 Lawton Blackberries. * * * As to chickens I have about 200. The hennery contains two acres with a building 96x24 feet and which is divided into three compartments as is also the run; we keeping three breeds. * * * I find it a little lonesome sometimes, but in conquering the work that stares one out of countenance on a farm, I find the time pass away quite quickly. Nevertheless, I am so well pleased with country life that I would not return to the city for a good deal."

FLOWERS CHANGING COLOR.

Last spring a lady brought me a red bloom of a Cactus so that I might name it. While she eulogised it, I told her it was the bloom of a miserable variety or badly grown plant of Phyllocactus Ackermanni. She felt disappointed and affirmed that the plant was in excellent condition, plump and green, and she watered it every day herself, and it was growing in their sitting-room window where the temperature was never below 60°. Precisely the opposite conditions of its requirements I assured her, and advised her to place the plant in the sunniest window, in a temperature of 45° or so, if practicable, and stop watering it altogether.

She called three weeks ago to show me a glowing brilliant red blossom she had plucked from the same plant. "If I did not own the plant myself, and had not, with my own eyes, seen those two flowers growing on it, I could'nt have believed two such differently colored blooms could be borne on the same plant. I treated it as you advised me, though I must say it was

awfully cruel, it shrivelled so, and everybody said it would die, but it did'nt." It is the same with Cactuses as with other plants: over-luxuriance is productive of abortive and faded-colored blossoms; plants that are over-watered or kept in too close and shaded quarters and unseasonably or unnaturally high temperatures, never bear such brightly colored flowers as they otherwise would. This is well illustrated in forcing Roses and other plants; we cannot get too much sun to intensify the color of the petals. Blossoms plucked from plants out-of-doors are brighter and more substantial than they would be if raised in a greenhouse. And in order to have intensity of color in a flower we must secure a thoroughly ripened constitution in the plant, for every florist knows what absurdity it would be to expect profitable Roses in winter from sappy-stemmed plants that made their growth in the fall. Last spring I had a good example of the poor color of unseasonably forced flowers; we bloomed Crassula coccinea in March, and its flowers were washy pink. In June we bloomed some more (in both cases the plants were raised from cuttings taken from the same plant, therefore unmistakably the same variety) when the color was bright scarlet.

THE TEXAS HORTICULTURAL AND POMOLOGICAL FAIR.

HOUSTON, Texas, July 29.

THE Texas Horticultural and Pomological Exhibition came off on the 17, 18, and 19 inst. At the start the display was rather meager, but shortly afterwards the products began to pour in from the interior of the country and the numerous tables of the espacious exhibition-hall were soon teeming with the "fair" products of the land.

FIELD CROPS.

As to field crops, fine samples of corn, cotton, sugar-cane and tobacco were to be seen from the rich bottom lands of the adjacent counties, while Northern Texas made up the collection with every kind of small grains, as wheat, rye, oats, barley, millet, broom-corn and sorghum.

VEGETABLES.

The quality of vegetables was not as fine as it would have been, if the exhibition had taken place about a month or so sooner; for much of the garden truck is out of season at this time. Among the most noteworthy exhibits were some very fine Peerless potatoes; and a watermelon weighing 61 lbs.

FRUITS

In fruit, the leading varieties of peaches, together with seedlings no less beautiful and promising made a nice display, especially those from the more northern parts of the State. That section exhibited some apples of pretty fair appearance, though in pears it could not beat the more central parts of the State. This county exhibited figs, oranges and pomegranates, which helped to make the show still more diversified. In grapes, Delaware, Herbemont, Norton's Virginia, and others of the æstivalis sorts, were models of perfection, while all of the Labrusca varieties were imperfect and inferior, even those from Northern Texas, showing at a glance that this last species is not at home in this State.

FLOWERS.

In the floral department a numerous collection of pot-plants of the leading florist kinds, adorned the benches, though there was nothing especially novel or striking among them. Quite a commotion existed among amateur florists competing for Vick's premiums for cut flowers. The contest was animated; the varieties of flowers were numerous, some parties exhibiting from 150 to 180 varieties, including annuals, herbaceous, bedding, pot and shrubby plants.

MISCELLANEOUS.

Fort Bend County made an unusually fine and most diversified display of its products and resources, including 49 sorts of its indigenous woods and 9 different kinds of arable soils. This was in competition for a prize consisting of a silver fruit-stand, worth $100. It did not get this prize, however, much to the surprise of everybody, except the three sagacious (?) Judges of awards.

As a special feature, all the agricultural and horticultural periodicals of the U. S were on file, among which, the RURAL took a conspicuous rank. The patent-bee-gum man was there, too; instinctively I looked for his confederate with the patent butter-churn, but strange enough, I could not see him this time.

G. M.

CULTURE OF SMALL FRUITS.

To purchase strawberries from the South is to send money out of the country. We must raise later varieties. The Monarch of the West is hardy and profitable. It will not bear high culture, and must not be set in too rich a soil. The berries have a better flavor and color than the Wilson. They do well on heavy soil; but if you desire good flavor, set them on sandy or gravelly soil. The Colonel Cheeny is considered a good variety; also the Captain Jack which ought to be cultivated until it runs out the Wilson. Strawberries require moist land, but not land out of which the water oozes. Sawdust does not make a good mulch, as it forms a harbor for ants. Leaves from the forest or straw keep the plants moist and clean.

Raspberries ought to be set four by seven feet apart, as their roots reach far and form a complete net-work underground. Leaf mold and chip dirt should be put around the roots. More cherries should be raised. Pears do best on the hills. Coal ashes could be used with success around the roots of apple trees to prevent borers.

M. B. D.

Binghampton Farmers' Club.

CALIFORNIA FRUIT NOTES.

OUR orchardists are busy getting the early fruit into market, the Red Astrachan and Early Harvest apples were in great abundance. In quality they were choice, and yet they sold at only six dollars per ton, the purchaser picking at his own expense. Early peaches are coming in in large quantities, and bring a fair price; the quality is fine. Of apricots there was the largest crop ever raised in this vicinity—the trees were loaded. Blackberries are fine and in abundance—from 25 cents to 40 cents a gallon, delivered.

W. C. L. DREW.

El Dorado, Cal.

Farm Topics.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

WE want to suppose a case: Suppose some morning we should find the worms rapidly stripping the currant bushes of leaves, and although white hellebore had been used for a dozen years, yet none being now on hand, would it not be a good idea to try something else? soap-suds, for instance, and if it saved the currant bushes, tell of it. [We presume this is a reply to the criticism of S. Rufus Mason.—EDS.]

THE kine-pox after keeping the cow's teats sore for three months, has at last run its course and the pustules are all dried up. It cannot be cured, but the soreness of the pox may be lessened by the application of oil or any kind of grease, and they will dry up sooner if a weak solution of carbolic acid is applied.

THE summer grass has come up so thickly in the rutabaga patch that it is a tedious job to grub it out. There are no weeds, but the moist, growing weather has started the summer grass as thick as it can be. With the cultivator, with the three square and hooked teeth, it can all be destroyed except a narrow strip, and this must be done by hand. This is a trouble we did not anticipate, and it will add one-fourth to the cost of growing the crop. As soon as they are weeded out we shall sow plaster on them and then again in a week. The blood phosphate did not arrive in time to put into the drills, and so we scattered it on the top of the ground on each side of the roots. Plaster was mixed with it to prevent the ammonia from escaping. The buckwheat where the phosphate was sowed and harrowed in has come up with a broad leaf and evidently feels the effect of the strong stimulant. We expect it will double the crop.

THE potatoes dropped on the sod in the baby's nut grove and covered with straw, are now a mass of vines, and have received no attention except to pull out the thistles which forced their way up. Paris-green has been sprinkled on twice. The young potatoes are forming under the straw thickly and the crop gives fine promise. The grass is all dead and the trees show the favorable effects of the abundant mulch and no sod to rob them of the moisture and other nutriment. The potatoes come up equally well through the buckwheat and oat-straw and seem to grow alike vigorously in either. Many door-yards might be utilized in this way to the advantage of the trees, and the potato-bin. We cut our seed into very small pieces of one or two eyes and dropped them about a foot apart. Planting in this manner will cause the entire ground to be covered with the vines and help to keep down weeds.

THERE will not be more than one-third of a crop of pears in this section of the country. Apples are dropping badly, but notwithstanding there will be a large yield.

WEBB'S Swedish turnip kept sound and hard in the pig-house cellar until the last of July. This is the best variety to keep we know of, and it is an important item.

A NUMBER of our quince trees are blighted. Thus far, only a few twigs have been affected on the pear trees. The frozen-sap blights in the bark on the bodies of the small trees, in many cases, are becoming healed by the growth of new wood. Wherever the bark on the whole body is black inside, there is no use of hoping for a good tree, and the sooner such a tree is replaced by a sound one the better. They may live for two or three years, but are sure to die. In some cases, such a tree will send up a vigorous sucker from the base, and if this is near the ground, the old tree may be cut off and the earth being heaped up around the sprout, it will make new roots and sometimes a valuable tree. These are the exceptions, and generally it is best to replace all sickly or diseased young trees with a new one as soon as possible.

THE bugs and worms were thick in the cabbage-heads and injuring them. They were more partial to the younger ones, which they were fast destroying. Powdered sulphur has been thickly sprinkled in, and on the crowns of all the plants, and we expect to save them. Snuff would be more effectual but it is too costly. White hellebore would do it, but it is too poisonous to risk. Sulphur won't hurt any one—the little which might be eaten.

MR. DAVID SMITH and a number of other farmers cut their oats with a mowing machine. They begin before they are dead ripe and do the work while the dew is on. They also rake them up with a horse-rake. They think the waste is not equal to the cost of hand labor.

MR. HOYT kept seven sheep, grade Cotswolds, and raised thirteen lambs. He sold his wool for thirty cents a pound and his sheep averaged six pounds each; this makes an average income from each sheep of $8.30 or a total of $58.10 from the flock, rating the lambs at the market price, $3.50 each. The seven sheep can be kept on the same feed as one cow, and with ever so much less trouble they will afford a greater yield. Where there is a good market for lambs, farmers ought to keep more sheep.

AGRICULTURE—PAST, PRESENT AND FUTURE.

THE past shows plainly enough to all who are intelligent, that there are many very stupid people living at the present day, for, although there are men who assume to find fault with everything done by our forefathers, yet there is much being done now far more reprehensible. The good old folks would not plow and cultivate without manuring poor, worn-out soil, nor were they silly and presumptous enough to advise young men to wear themselves out by such long days of wearisome toiling and broiling while cultivating land which had lost its fertility. No! they liked to have something to show for what they did, and if any of their soil began to grow light crops, they would thoroughly renovate it.

At the present, cultivation is relied on to make a good crop, and the soil is worked backward and forward and across, this way and that way, and whoever fails in having an average number of bushels, is spoken of as being lazy. The facts of the case, however, generally are, that the soil and the owner of it have both been worked nearly to death, which is the case every year with hundreds of good, honest men, who are bringing themselves and their farms to a pitiable state of poverty, gradually getting poorer and poorer, and yet, before becoming totally discouraged, working harder and harder. Every bit of meadow having any sod upon it is plowed under with faith in its being able to feed a crop of corn, and with a forlorn hope of its growing good timothy, after a round of corn, oats and wheat.

Look at New England, where a few years since I saw, in New Hampshire, bits of two and three acres of the best portions of the meadows plowed and planted with corn, potatoes or grain, it being well known the rest of the fields were exhausted by annual mowing, and a few months ago, one of the agricultural papers claimed that New England was in a high state of fertility, because these little plots of one, two or three acres, being little dells of deeper soil, had grown as much per acre as the States where whole fields are not dotted out in this way but planted to one crop. Look again at States in other parts, where farmers have worked early and late, and led their hands from sunrise to sunset, all through the broiling sunshine, till every particle of fat has run out of their bodies in sweat and every atom of fertility has gone from the land in the crops so industriously worked out of it.

The future can be foretold: all the best of this poor, exhausted land, must lie in weeds and such grass as will grow, and sheep will have to run on it till time has thickened the grasses and lessened the weeds, while the worst and irreclaimable, poverty-stricken side-hills and barren districts, will have to be planted with trees to meet the future scarcity of timber. In the future, cattle, also, will be raised in greater numbers, so that they, along with the sheep, will restore to the soil much of the fertility of which it is now recklessly robbed.

GEO. GARDNER.

NOTES FROM MAPLEWOOD FARM.

HECTOR BERTRAM.

PREMIUMS FOR THE BEST PRODUCTS.

WE have been having quite a lively competition as to who should or could produce the largest head of Timothy grass. Mr. COOPER led off with one nine inches in length, and challenged any one to match it. The result was a general search for heads of Timothy of large size, and Mr. COOPER was soon left out in the cold. A number of specimens were gathered ranging from nine to thirteen and a half inches. This may not be of interest to many of the RURAL readers, but the general interest manifested by each of the farmers in this vicinity to discover the largest head on his own premises, suggested an idea which, would others look at the matter as I do, might be of general good among farmer folk. It is this, that wherever a majority might be willing, a vote should be cast, at the annual town meeting, for an appropriation to be held by the Supervisor, as premiums for the best field of corn, the best crop of fruit, the heaviest fat hog or ox, etc.; that the competitors should select a committee to visit the premises of each, and make a report in writing as to the merits of each entry; and that a general meeting of all interested, be called at such time as may be deemed most expedient, when the reports shall be read, and premiums awarded. Now, I am not sure that this, if carried out, would prove successful; but I think it might, and that it would tempt farmers, generally, to endeavor to raise the best of everything. Write about it, Ruralists, and let us know your minds in regard to the matter.

STRAW MULCH IN ORCHARDS.

Mr. LEWIS utilizes his extra straw, left about the yards in spring, by spreading it under the apple trees to the depth of a foot, as far from the trunk as the branches extend. A few pieces of rails or a few stones are sufficient to keep it in place until it becomes so settled that hard winds will not scatter it about. It makes an excellent mulch for the trees, exterminating the grass entirely wherever it is deposited, leaving the ground perfectly clean and mellow. Besides, the windfalls are unbruised, and are kept perfectly clean by falling on the carpet of straw. It would be safest, however, to clear it away from about the stems of the trees in fall, as it would afford an excellent harbor for mice during the winter.

PROFIT FROM RAKING STUBBLE.

It pays to rake the stubbles. No matter how carefully the work is done, much of the grain will slip through the rake, or be scattered while binding, shocking, and drawing the crop. A neighbor was visited by an agent desiring to sell him a wheel-rake. The farmer demurred. The agent, as an inducement, proposed that he take the implement, carefully rake all his stubble, properly curing storing and thrashing what he might gather, and he agreed to take the grain thus obtained, as payment for the rake. In this the farmer imagined he saw an easy way of obtaining the tool he needed, but did not feel able to purchase. They shook hands on the contract, and the agent went his way. In the fall he called again. The farmer had concluded to pay the money for the rake, begging the other to release him from his former promise, which was done. The grain obtained by raking the stubbles was worth nearly double the price paid for the rake—and this in a single season!

A BURDOCK EXTERMINATOR.

For years we have been troubled with burdocks, and, notwithstanding repeated mowing during the summer, they would form seed in the fall. After many experiments, a certain and speedy remedy for the pests has been discovered in kerosene oil. If a small quantity be penred into the hearts of the plants, directly after cutting, they will disappear entirely, roots and stalks, leaving no trace of their former existence save a small hole in the earth where they stood. This may be styled by Gen. Noble, a *crude idea*, but refined or crude oil will accomplish the purpose equally well.

A BOON FOR HORSES.

If horses are rubbed, morning and noon, with a handful of smart-weed, the flies will not trouble them in the least through the day.

Field Crops.

THE TOBACCO PLANT.—No. 2.

E. R. BILLINGS.

VARIETIES.

THE tobacco plant, though an American product, has been transplanted to all lands, its cultivation seeming to follow its use, which has now become world-wide. It is doubtful, at the first discovery of America, whether there were more than one variety of tobacco cultivated or not; but it is altogether probable that there were several sorts, inasmuch as the plant was grown not only in North and South America, but also in the West Indies where the great Italian navigator first saw the plant and its novel mode of use. Some writers on tobacco place the number of varieties at upwards of forty, all of which have sprung from the varieties grown in America. The numerous sorts owe their variety to the various soils on which they are cultivated as well as to the effect of climate.

Late writers on tobacco place the number of kinds grown in the United States at fifty. Tobacco is now grown more or less in twenty-five

States in this country, while it is grown to some extent in Canada, as well as in Mexico, Honduras, Guatemala, and some others of the Central American States. In Europe, Asia and Africa tobacco is extensively cultivated, growing as far north in Europe as Moscow in Russia, as well as in Denmark and Switzerland. It grows equally well in interior Africa, while in China and Japan it proves a successful rival of the tea plant. In India, under the fostering care of the English Crown, it is already becoming an important product, while Spain has grown it in the Phillipine Islands for more than two hundred years.

Tobacco, for all of the uses for which it is intended, is divided into two classes—cigar and cutting-leaf; the latter class including snuff-leaf. Cigar-leaf tobacco includes the tobacco grown in New England (both Conn. seed-leaf and Havana seed tobacco), Pa., N. Y., Ohio, (this State also grows cutting-leaf), Wisconsin, Illinois, Indiana. Cigar-leaf is also grown in Cuba, St. Domingo, Mexico, Brazil, Paraguay, United States of Columbia, Hungary, Holland, Switzerland and Phillipine Islands, and in other portions of the world. In this country, owing to its vast extent, very many sorts are cultivated, and in two of the States, Virginia and Kentucky, it is the great agricultural product. America is, therefore, the greatest exporting country of tobacco in the world, and Louisville, Ky., the largest tobacco market.

It is important that the grower of tobacco should thoroughly understand the nature of his land in order to determine what variety to plant, cultivating only that sort that will give the largest returns. Massachusetts raises the largest number of pounds to the acre, 1750, and West Virginia the smallest, 575 pounds. Some varieties of the plant are very large of growth, reaching an altitude of some six feet, while others do not grow more than two feet high. Yara tobacco, grown in the island of Cuba, is one of the tallest sorts cultivated, growing as high as corn and, after being topped, usually bears from 18 to 22 leaves. The shape and size of the leaves vary greatly. Some sorts bear long, pointed leaves, while other kinds produce leaves nearly round. Some kinds bear pink flowers, like all of the sorts grown in this country, while Latakia tobacco bears a yellow flower, Guatemala a white blossom, and Japan tobacco a purple flower. Some tobacco leaves grow close together, like Yara, and others (dwarf tobacco) grow in a cluster at the foot of the plant. Some varieties have a large stalk, like Pa., Conn., Va. and Kentucky, while Havana, Yara, Persian and Latakia have a small hard stalk. Some leaves are attached to the stalk by a long stem, like Syrian tobacco, while most kinds grow closely to the stem. One variety, the White (Ohio), has a white stalk and midrib and light-colored leaves. The colors of tobacco are also various. The seed-leaf varieties are usually light and dark cinnamon in color, while Kentucky, Missouri, Holland, Perique and other sorts, are very dark or black. Some of the Southern sorts are very light in color (light yellow), while kinds grown in Asia are red.

No product grown affords more scope for study, both in the field and from books, than the tobacco plant. To raise fine tobacco is, in all respects, a science, and for really fine crops very high prices can most generally be realized. The growers of New England and Wisconsin are now trying to raise tropical varieties of the weed, and, if successful, will still further advance the culture of the plant as well as add very much to the profit from its cultivation. More than 250 years have passed away since the Virginians engaged in its culture, and to-day it is one of our greatest products as well as our oldest article of export.

Farm Economy.

COURAGE ON THE FARM AND IN THE SWAMP AND MUCK-BED—No. 1.

GEN. WM. H. NOBLE, OF BRIDGEPORT, CONN.

"L' homme propose, mais Dieu dispose."

This reverent French maxim is a thoughtful text, and a little sermon by itself. But its real spirit is lost many times, in a woe-begone rehearsal, "Man proposes, but God disposes." This is well said, if we mean thereby, when human effort gangs awry, that "there is a divinity which shapes our ends." "Uttered or unexpressed," it may be the heart-voice of a pious resignation; but sometimes it is the wail of a sinking hope, and about as often merely the impious growl at failure, doomed against some folly or madness from the start. The human tries his hand at something better left undone, or, venturing beyond his depth, charges the swamping of his endeavor on some special providence. This laying blame at God's door for the outcome of our folly, blunders or misdeeds, is, in the main, but a sham of reverence, and an impious conceit.

That God disposes events, I do not doubt. But my faith is, that he acts through general laws and the essential nature stamped on "all that moves and has being." Only at long intervals through the ages, does the Great Ruler of events descend to touch man's life and his infirmities by some special providence. It is against these general laws and that essential nature that the human wrecks his hopes. It was their help and following that lifted the prehistoric man from crude virility to a better manhood. Their study and alliance secure a mighty aid; but across the path of him who heeds them not, they rise a wall of adamant.

Now the farm furnishes examples of all this, as amply as any other phase of life. He who hangs his harp upon the willows and says, "I am a-weary and discouraged; God disposes not his elements to increase my store," is an impious drone, a blind man walking in the light of day. All around you God has disposed the ways and means wherewith to swell the returns to your toil. Besides, you and all are forces and treasures ordained and awaiting, through the centuries, some bright-eyed mortal to loose their bond or to lift their veil. When such a man, plunging beneath the shallows of the mass, studies out and reveals any of nature's dormant reserves and unmated forces, he has only done a duty, which, in part, belongs to all. It matters not whether the thing revealed is some sleeping energy, or some stored-up wealth. The human has not made them, nor has a special providence given them life. They were before him, awaiting summons to a higher mission.

It is no new element or form of motion just divinely ordered, that girts the world with speaking fire that makes vocal with song and greeting the wires that web the land—that calls back the wave pulsations of the voice from and through solid iron. Throughout the wondrous facts of science and invention, it is only some slumbering giant, among nature's unharnessed servants, whose power or store of good, inventive genius has singled out or mated for the use of man. After our first surprise, the real wonder always is, that our boasted intellect took so long to find that which has lurked close by our pathway through the ages. Yet the same bated breath and the same wonder will forever greet each new victory of endeavor.

Pretty much so it happens in the garden and the farm. Man's first lift from savage life was to them. In no line of life does he stand so close to nature in all her moods. But their study and help, the husbandman has not made a foremost interest and duty. He has not kept pace with the force, keenness and mobility of brain, begot of human contact in masses. So, clinging to inherited methods and ideas, and averse to new, he starves and wears out his land. New appliances and sources of enrichment close at hand are a sealed book, or neglected. Disheartened by his toil and scanty crops, "the plowman plods his weary way," uttering from his heart, if not his lips, the sad rendering of our text, "Man proposes, but God disposes." He charges failure not to his halting, timid proposing and blind-eyed doing, but lays on Providence the squelching to which their wish-wash destined both. The trouble is, that the proposing is greatly ahead of the doing, and neither gets much help from brains. Doing has other meaning than deeds of back-work and muscle. A brain, apt and eager to take on new ideas, has all to do, both with what we propose and what we perform.

Whether we work self-taught by eye and studious thought, or on something given us for trial out of the research and experience of others, such a brain and its mental frame-work lift the earthy man to higher and more telling toil. Not only is the farm-brain, as a rule, slack in self-teaching, but it turns its back on new lessons—sometimes under the conceit of knowing better, but as often through sheer stolidity. Even when some patient work and search have conquered larger and easier crops for the farm, instead of following up and testing this line of trial, its owner is mute with wonder and distrust. So he lives on. When his crops are glorious and barns well filled, the husbandman growls not, but sings with joy. The propose and the dispose are all right. But let the means of enrichment fail his lands—no increase come to his flocks and store; and right-away he says, "Alas! Providence disposes neither the elements, nor my place in life, to second my endeavor. I delve and plan but naught I do brings plenty. My lot has fallen in barren places, my soil is shallow and worn out; my acres starve for want of means and material for their enrichment. I should have guano from the far-off islands of the sea, the waste of the great city, the droppings of the stalls; but my product barely serves my table; I have not wherewith to buy these things for which my land hungers."

Despair not, fellow-husbandman. What you covet would work rapid cure to your dearth of crops, but there are other chances of enrichment than those you gain from afar, with great outlay of money, time and toil. Although you have not cash, nor manna showered down to feed your land, there may be store near-by from which to help your barrenness. Within the reach of every thoughtful, toilful, hopeful tiller of the soil, are unused forces and garnered stores for all the needs of his acres. They await your thoughtful labor, mated with the alchemy of the seasons, to transmute them into bounteous crops and gold. That tumbling mountain brook, plunging along its load of plant-food, offers you no end of help. Turn on to your meadows its flood, burthened with the waste and decay of the rocks and woodlands. The breeze that shakes out the tassels of your corn, or sweeps with swaying waves the fields of grain, or wafts the clover perfume on the air, when you rightly till, will unload its enrichment among the products of your farm. All these measure out to you their blessing, just as you mete to your land toil and fatness.

There is other stored-up food for hungry fields, that will not flow and blow to help you. Up in that rocky, woodland glen, the drift of rains and storms and melting snows has piled deep the moldering waste and vegetation of ages. Unload this, pure and simple, on your meadows and grain land, and at every step your product marks its coming; or, better, help with its richness the fatness of your stalls and manure pile. You may thus beyond count swell your increase.

Then, in sight of about every homestead, its owner holds some dank and miry swamp, or some sour grass bog-meadow. For centuries, it has been little but the home whence the hybernating frog wakes from his wintry sleep, with the first rude song of spring. That deep slum and wet footing, whence you only get, from the bog turfs, a few messes of young grass for your spring milkers, God meant for your best meadow. Deep muck, that registers the decay of centuries, there waits in sour blackness low-down under-drains and the clearing of its surface, to sweeten into your choice hay-land, or to become the joy of any crop. Take heed, no petty surface-drains, no half-way work! But dig them deep and large, and bottom with bulky tile. One way-down, big-tile drain, is worth a dozen shallow ones, lined with slender pipes. It gives you undertiers of acres. It builds downward stories to your land, that call for more lofts to your barns, and crowd them round with stacks.

But, best of all; there is on, or near by, every farm-land, a deep peat-bed, where sphagnum moss, or grasses and reeds, have recorded the ages, in countless tiny layers of growth and decay. This holds land wealth piled fathoms deep. Not half the owners know the depth, and less of them the value of this stored-up fertility. Its vast treasures of enrichment offer succor to your waning crops. Earth holds no like castaway and unheeded wealth. Seas, and savage noisome lands, and more savage tribes, stay not the search for gold or diamond. Toil, hardship and danger are defied to dig them pure and simple from earth placers or the solid rock. But the chance, right at hand, of transmuting this deep peat-bed into gold, through the alchemy of a crop, neither you nor the generations heed. The fog that broods over its chilly dampness, is but an emblem of the clammy brain that passes, unheeding, this vegetable wealth for which your soil so hankers. Yet every day records this same stolid neglect. But when you dump a horse-cart load of dry peat upon your land, or farm-yard, or compost heap, you make a dollar. In no way can the farmer so quickly reach substance in land wealth or funded stock, as by mining these peat beds.

The hundred dollars got by hard work, or scrimp of table raiment, put on mortgage, or in savings bank, or in government bonds, win you but a small return. But your hundred, put into the peat bed, with your own and others' toil well handled, will turn out a thousand, and keep it compounding. Why does not work or cash on the farm invest more in these Banks, which providence has disposed at our hands, and made so secure, and sure of dividend. There is no lottery, no chance of blanks or failure in this peat bed. It is God's insurance of prosperity to wit and toil.

Ah! purblind and self-cheating human! God disposes at your door his gifts, in full measure for your enrichment. The fault is yours! You do not propose, or set out with a will, to do the duty, or to grasp the chances before you. You put no brains, no study, no patient thought, into your toil. So you prosper not. Your business is in the soil. But what do you know about its assay of organic or mineral wealth, about the way to mine their richness, or to supply their needs? In solemn fact, beside the gain of a few handy implements, how much advance has the average farm-brain made ahead of the stalwart savage founders of our race? They tilled only a little patch. But in the line of their endeavor, they beat your brain work. No plodders went before to break their paths. The craft and alertness born of fight and rapine; of the stealthy hunt of beast and enemy; of the sharp watch of faint trails through the trackless woods, kept their brains alive. But the listless monotony and drag of farm life veil from the mass of its toilers resources of land enrichment sighted from their doors.

Wake up, man, and right off turn that swamp land and peat-bed into crops, brimming your mows and grain-bins. It is no abstruse job to map and mark the grades and lines and size and depth of their drainage. You need no engineer with levels, sights and chain measures. The simple sense of any man who can read figures on a rod or line, or sight a st o, is equal to the task. All you need is a tape-measure, a tin milk-pan, not too much bunged, a long, light pole, with a red rag tied thereto.

Now measure the length and breadth, and sound the depth of your water-logged area. Along that length-line, at each hundred feet, from the head of your drain, mark on a stake, the sum of that drain-head's depth below the surface, added to the feet of fall you give your drain to that point, and so on down. You can thus dig just to grade either at or between the stakes.

When, in this logic of your work, you come down to, or near the natural outlet of the wetness, look at the trend of the land beyond. Knowing the depth of digging at the last stake towards that outlet, judge how far down the grade or stream beyond, you must make the outlet of your drain, to insure a quick delivery. There plant your pole, with the red rag marking thereon the sum of drain-head's depth, and of drain-fall, from head to outflow. You may not guess exactly right. But place that brimming pan close to the surface of the peat, and sight along its water level that red rag. If you have not put that lowest stake aright, let your pole be moved up or down stream, till your level strike the rag. Then drive at the foot of your pole stake to mark the outlet of your drain. This completes the lines and features of your work. The same routine and logic will fit any drainage. —[To be Continued.

THE COMPOST HEAP.

We take it for granted that very little need be said in this day in favor of the largest and best possible collection of fertilizing elements properly prepared, as can only be done by composting. As a correspondent inquires for specific directions in composting, we give a short account of the simplest process which is believed to reduce the fertilizer to the nearest possible condition for immediate use by the young plants. Simply covering straw, vines and green manure in the earth is better than no manure, or than spreading them upon the surface, but it is very far from the most effective or economical use of such materials.

We take it for granted also that the farmer knows that a few dollars earned in preparing his own fertilizers, are just as well as if paid out for others, and that a perfect care of manures is as necessary as a perfect curing and storing of the crops he raises.

Composting should be done under cover, as all manure should be kept under cover in summer, especially. The location otherwise is of less moment. If the composting can be done upon the land where garden or other crops are to be raised, it is better than if done in the barn-yard, unless a water-tight floor is provided, as very much is washed into the ground, even with the best possible care. It is not necessary that any amount of leaching should take place; in fact, no liquids should escape or be added to the heap, except as absorbed by some bedding or deodorizer, or such as will readily be absorbed by the refuse already in the pile. The shape of the heap is of little account. It is more convenient to handle in a pile much longer than wide, but there is much saved by having the sides inclosed by a tight board fence. The practice of supplying a couple of hogs with all the refuse, and the additional ingredients, as obtained, and scattering a few kernels of corn upon it, is a good one, but whatever the first process of piling up the material, it must needs be forked over frequently during the year it is waiting for use, to allow of decomposition.

Manure should not be applied to land until it has rotted during one summer at least, and what has accumulated during the winter should be piled in the heap, so as to be turned over from time to time. The only remaining care to be exercised is to have a barrel or two of plaster on hand at all times, to prevent the loss of ammonia in the vapor arising during the heating. To prevent this, some twenty-five pounds of plaster to every ton of manure are thinly spread over the heap, as it is piled up or forked over, and if, during the heating, the smell shows that any great amount of ammonia is escaping, then a slight application of plaster will serve to keep this valuable ingredient within the pile. Any liquid draining from the pile should be absorbed by earth or muck and returned upon it.

DRAINAGE.

In an article under the above title, by Prof. R. C. Carpenter, I find much valuable information. Very few farms are perfectly drained naturally, and it is no exaggeration to say that a careful perusal of these articles is worth ten times the cost of the Rural for one year to any owner of an undrained farm. If any criticism can be made upon these articles it is that perfectly constructed drains can be made by any one who has average ability without one-half the appliances Mr. Carpenter uses, or one-tenth the preliminary surveys and levelings. In bottoming a drain a few barrels of water can be drawn upon a stone-boat along the line of the drain, and a perfect fall obtained. There can be no

mistake about a flow of water running in the groove made for the tile, and any inequalities can be removed and a perfect fall be obtained throughout the entire line of drain. Farmers ought to understand that, when it is inconvenient or impossible to obtain these surveys with instruments, with proper care a good working drain can be made—that nine farmers out of ten, after hiring a man who understands drainage to make a few drains, and carefully observing the work, can with such labor as they can readily procure, go on and complete their drains without incurring the expense of hiring professionals. By all means, though, observe Mr. CARPENTER'S general rules, and especially his system of marking drains and preserving a record of them. The land-owners of this country are indebted to Mr. C. for his articles.

E. L. MARSH.

IRRIGATION.

A PRACTICAL, economical system of irrigation is believed to be a growing necessity in the Eastern States, as well as a source of profit in the far West. The problem is how to store up a water supply for use, or how to return it from low places to the higher. And here is an opportunity for some inventive mind to work the problem out. Wind-mills are a partial success, but only partial, and, as at present constructed, they are too costly for general use. Another difficulty is that the wind-mill is practical only in exposed situations or upon elevations, while the water is generally found in the valleys. To make the wind-mill operative, it is necessary to have one of less cost and intricacy of construction and management, and it must be applied to drawing water a long distance and to a considerable hight, or to forcing it so to rise by the application of compressed air conveyed in a pipe and turning a force-pump, or to directly forcing the water through another pipe to the place desired.

Something similar to this has been found impracticable in one instance, after a trial of three or four years, although at first partially successful, and probably so far so as to suggest a basis for farther and more fortunate experiments. The ram is the simplest means of raising water where a running stream can be utilized, but this is not always to be had, especially in the dry season, when most needed.

An invention is suggested for compressing the air in the vicinity of the wind-mill to be conducted through a pipe into a tank full of water, forcing this through an outward opening and self-closing valve and through a pipe to the point desired. Such a supply of water would be irregular, but it could be managed at the vicinity of the wind-mill or water supply as the tank would be self-filling upon the withdrawal of the air force, and supplied with a self-closing valve opening inward to prevent the escape of the water excepting through the pipe in the direction desired. S. S. B.

Miscellaneous

THE TRUTH ABOUT IT.

[UNDER this heading, a number of articles have been prepared by able writers. These will appear from time to time. Their object is not at all to deal with "humbugs"—but with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

BENEFITS OF EXCHANGING SEEDS.

M. B. BATEHAM.

IT is a common belief among farmers and gardeners, and one sometimes advocated by agricultural writers, that crops are improved and varieties of grain, potatoes and garden vegetables prevented from "running out," by occasionally procuring seed from a distant locality, even though it be not any better adapted for the growth and development of the particular crop than the one where the seed is to be sown. I have never seen or heard any satisfactory reason for this belief, and from long experience and observation, I am prepared to say it is contrary to the majority of facts and to the teachings of science, and is often detrimental to those who practice it.

Seedsmen of the largest experience tell us that where the soil and climate are suited to any kind of vegetable, and sufficient care is bestowed on its culture, and admixture of varieties is guarded against, the fullest perfection is maintained, and improvement often secured. Hence we find them growing the same varieties of cabbage, melon, onion, etc., for an entire lifetime, carefully avoiding any change of seed, and claiming for their own superiority over all others.

Farmers also can be found who have grown their own favorite wheat, oats or corn, saving their seed each season with care, for twenty or thirty years, with continuous improvement, rather than deterioration. Of course, it will be of advantage for the average class of farmers to send for seeds to such a farmer, but the latter would surely be a loser by taking seeds of them in exchange.

I admit that many kinds of vegetables will deteriorate by growing the seeds where the soil and climate are not adapted to them, or where the right system of culture is not bestowed; and hence many people do well to procure seeds from a distance, if it is done from sources where greater perfection is secured.

Take the article wheat, for illustration, and intelligent millers tell us that samples of the same variety grown by different farmers, with different soil and culture, will vary materially, some seasons, in their proportions of starch and gluten; the grain is more perfectly developed in one case than in the other, and will be worth more for seed as well as for flour, so that it will pay well for the poorer farmer to sell off his own and buy seed of his more skilled or fortunate neighbor. But there can be nothing but loss to the other party from an exchange of seed.

So with potatoes: it is found that the proportion of starch in the tubers is materially affected by the season, soil and culture; and when deficient in this element they are not so valuable for seed, as the growth is less healthy and the defect will appear in the succeeding crop. In such cases, of course, it is well to "change the seed," but otherwise the mere fact of change can do no good, and the man who is not careful as to the quality of the seed he procures, is liable to be a loser by the exchange.

Lake Co., O., July, 1878.

PARISIAN CORRESPONDENCE.

EXHIBIT OF AGRICULTURAL IMPLEMENTS, ETC.

LETTER FROM PROFESSOR I. P. ROBERTS, OF CORNELL UNIVERSITY.

As one wanders through the long halls devoted to the display of European farm machinery and hand implements, the first thing that attracts attention is the peculiarly American look of many of them. Stop and draw the attendant out, and he soon reveals the fact that they get their implements from the Centennial Exhibit in the United States.

Mowers, reapers, with and without self-binders, and horse hay-rakes, which would require an expert to distinguish them from those made in New York, appear in numbers both in the English and French Departments: and several other countries are but little behind in their adoption of the American reaper and mower in the minutest detail. There is no law here which protects the patentee, if he is not a resident. The question remains to be solved whether the valuable trade with Europe in farm machinery, largely built up since 1876, will have to be lost on account of this universal legalized theft of the labors of others, or whether successful competition can be carried on by Americans. The comparative cheapness of suitable woods and the use of machinery in manufacturing them, may carry the day.

The most part of France is not so well adapted to machinery as Holland, from the fact that the divisions of land are so numerous; many of the farms are from ten to twenty rods wide, and these are again sub-divided into three or more strips, with as many different kinds of products growing upon them. Viewed from a distance, they look very much like the American Flag. Notwithstanding this, the French take kindly to labor-saving machines, while the Dutch appear to delight not only in doing things well, but in doing everything the hardest and slowest way. From Rotterdam to Leyden is almost one continuous meadow, and yet I did not see a single mower at work, and but two horse-rakes. Their scythes, rakes, forks and carts appeared to my American eyes to be at least a hundred years behind the times. In farm implements, Holland's exhibit here is simply nothing.

The show of harvesting machines from the United States is creditable but not extended. While each individual machine is of the most perfect construction, the exhibit is too limited as to kinds, and too small in quantity, to give anything like a fair conception of either the number or great varieties used by Americans.

In hand tools for the farm, the United States are still a long way ahead of any other nation. But if one looks carefully, one will find that here, too, France and England are rapidly adopting the lighter, more efficient and graceful forms of the "Yankees." France certainly might improve on the length and shape of her hoe handles. What would a New York farmer think of having twenty acres of sugar beets planted so closely that the horse hoe could not be used, and the only other implement for their cultivation a hoe slightly wider and lighter than the American mattock, with a handle just *twenty inches* long! Yet it is not uncommon to find this state of things in France. The beets looked well, but the workmen had to try twice before they could straighten up to a semicircle.

I made a short visit to Grignon, the seat of the chief Agricultural school of France. At some future time I may give you a detailed account of this fine institution; for the present, suffice it to say that I found them using oxen, not with a yoke upon the neck, but with a padded one attached to the head at the base of the horns. The reaper was of French make and looked as though it might do good work, but the self-rake did not fold or in any wise change its direction, but made one grand sweep of a perfect circle; this necessitated a tongue upwards of sixteen feet long, to avoid raking on the horses with the grain. Their mower was from Providence, R. I. The horse hay-rake was French, and not by any means un-American, except that the driver walked. The thought struck me that a "Yankee" would use such a rake just half a day and then, while his horse ate his noonday meal, he would take an axe and an auger and construct a seat.

REMINISCENCES OF ROTHAMSTED AND TIPTREE-HALL FARM.

S. B. PARSONS.

ED. RURAL:—I am glad to see in your widely-circulating paper the valuable contributions of Mr. Lawes, of Rothamsted. I am surprised that he can find time to write for any paper, and think it an especial compliment to the value of your journal that he has written for you.

ROTHAMSTED.

It is now nineteen years since in all the beauty of an English June morning, I left London for Rothamsted on invitation of Dr. Pugh, who was then associated with Dr. Gilbert, and who afterward became President of the Pennsylvania Agricultural College. By his death soon afterward, our country lost a man whose mind was of remarkable breadth, who was thoroughly trained in the science of agriculture, and who was eminently fitted to continue in this country the experiments with which he was familiar at Rothamsted.

On arriving at the station I was met by Dr. Pugh, and we were soon walking over the grounds. The well-kept lawn and the rambling, home-like mansion, the architecture of which showed the mark of centuries, possessed for me great interest. I was disappointed to find that Mr. Lawes was absent, but in our rambles we came to the piazza, on which we found Mrs. Lawes with her easel and canvas. Thoroughly enjoying her country home with all its charms, she found time for her favorite pursuit, herself forming a picture framed in the vine-clad columns of the piazza. Being invited to lunch with her, I had much pleasant conversation, and was glad to have strengthened the impression which is always made by the charming manners of a high-bred English lady.

This pleasant hour being over, we continued our rambles. After some conversation with Dr. Gilbert, I was shown by Dr. Pugh the systematic manner in which all the experiments were made. You have recently described these so well that repetition would be needless. The extent of the enterprise, the great variety and accuracy of the experiments, the careful recording of them all, and the examination, year after year, of all the links which made the chain of evidence, were to me very remarkable, and I scarcely knew which to admire most, the enterprise and liberality which planned, or the executive ability which carried out the multitudinous details of this valuable work.

It is difficult for a stranger to grasp at a single visit the whole scope of the system or adequately to realize the momentous results which must flow from these experiments, but of one thing he feels certain—that if agriculture is the source of political, commercial and social prosperity and wealth comes by the increase of the product of the soil, then Rothamsted and its experiments will yet be recognized as unequaled benefactions to the human race. Leverrier may discover a planet, Proctor may announce a limitless universe, Daguerre may fix the shadows, Edison may record and render back our words, but a truer benefactor than them all is John Bennet Lawes, because he adds to the productive power of the soil and to every cultivator gives additional means to gather around him the essentials of a progressive civilization and thus aids to elevate the whole human race.

TIPTREE-HALL FARM.

I should not pass over another place which I visited soon afterward and where the beneficial results of subterranean irrigation are clearly shown.

About thirty-five years ago Mr. Mechi, a successful London merchant, essayed to teach English farmers how to farm. He purchased land of a poor character, thoroughly underdrained it, built cattle stables floored with slats on which the cattle stood and having tanks underneath, into which all excrement fell, erected a steam engine to wash this into another tank of immense size from which subterranean iron pipes were placed all over the farm, with hydrants near enough to each other to work a hose of reasonable length.

After inspecting the admirably arranged buildings I was led to the cattle stables. The steam engine was started, and a torrent of water washed the contents of the tanks below the stalls into the large tank outside 30 feet in diameter and 30 feet deep. Into this last I looked and on the surface there appeared to be a thick scum almost as tough as cartilage. I asked how it was possible to get this solid material into the pipes. He replied, "you will see," and then having turned off the water, started the air-pump and forced currents of air through holes in the bottom of the tank into the mass of liquid manure, which boiled and seethed until the tough mass on the surface was finely broken up and the whole ready for the pipes. Then he carried me to the field where I found a man and a boy with a hose pouring upon the grass the black and liquid mass. The resulting crop must have been marvelous for a parliamentary commission reported that the farm of Mr. Kennedy, in Ayrshire, which I also visited, had by this system of irrigation produced 70 tons of green grass to the acre in one season by 10 cuttings, a statement too amazing to be taken except from a parliamentary commission.

My letter is, however, getting beyond limits. I can only add that Rothamsted and Tiptree Hall are two places which should be visited by every American traveler who may be interested in agriculture.

Flushing, L. I., August 5, 1878.

WHAT OTHERS SAY.

CLOVER AS MANURE.—Speaking of the farm of Hon. George Geddes, Fair Mount, N. Y., the Country Gentleman says: "The twenty-acre field which was cultivated for 70 years without barn manure, and which continued to yield heavy crops during all this period, was treated with an application of yard manure a few years since, not from any necessity for it, but because there happened to be a surplus near at hand. Mr. Geddes thinks it caused some increase in the luxuriance of the crops, but he still prefers, as a matter of economy, the practice of plowing in clover. A mass of the stems and leaves copious enough to fill the furrow, he finds more valuable than any common coat of yard manure; while the roots are not only a valuable part of the crop, but they serve as an efficient loosener of the soil. All the manure made on the farm, is however, carefully saved and applied as a useful auxiliary in maintaining the fertility of the land."

GREAT AMERICAN STRAWBERRY.—We had looked for much from this much talked of berry, and have, as our readers well know, often alluded to it in these columns. It proved, however, with us, of medium size and poor flavor; and many of whom we have inquired speak of it in like terms. Mr. Idell, whose experience is of value, speaks of it in the American Rural Home as follows: "I am aware that many fruit growers are anxious to learn of the success of the Durand Seedling Strawberries in our market this season. The 'Great American' was grown by several parties, and they were all well pleased with it. As soon as it appeared it sold for sixty cents a quart, fell to forty cents, then, as it became better known, advanced to seventy-five cents per quart. There were three well known dealers who sold them, and all speak very highly of their size and firmness."

BEE NOTES FOR AUGUST.—The American Bee Journal says that all impotent queens should be superseded, so that the colonies may be kept strong to gather the fall crop of honey. Queenless colonies should be given queens or frames of brood, if they have none, in order to raise a queen. If the brood chamber is full of honey, it should be removed from a few of the central frames with the extractor, in order to give the queen room for brood. The opening of hives and the removal of surplus honey should be done at night, in the early morn, or on a cool day.

Surplus honey should be kept in a cool, dry place. Examine the boxes and sections occasionally; and if any moth worms are found, remove and destroy them. Extracted honey may be kept in barrels, wooden vats or tins; the barrels or vats should be coated with wax to prevent leakage.

Care should be taken not to expose the honey, to start robbing. The entrance to weak colonies should be contracted, to enable them to defend themselves from robbers.

By the last of August buckwheat will have come in; boxes partly filled should be removed and extracted before that, so as not to have the honey mixed.

During August and September the bees will be more irritable than usual, and all who are nervous or timid should provide themselves with a good smoker and veil, if they find such necessary. These will steady the nerves and enable even the most timid to control their bees at all times, and make the necessary examinations with confidence.

In handling them, let the novice be careful to avoid jars, working quietly and steadily, always keeping perfectly cool. Should a sting be given, remove it, squeeze out the poison, and apply honey, soap, hartshorn, essence of peppermint or even a little mud.

THE SO-CALLED PERSIAN LILAC.—According to M. Decaisne, the tree usually called Syringa Persica should be referred to S. Chinensis, of Willdenow, and the epithet Persian should be abandoned in favor of Chinese. The true Syringa Persica has become very rare in cultivation. In spite of the appellations, the native country of the two species is still unknown. Wild specimens are not to be found in herbaria. Up to

this time then the species in question are only known in a cultivated state. The Gardeners' Chronicle says: "How odd this ignorance concerning the habitat of many cultivated plants! It is only the other day that the horse-chestnut was found in a wild state, and even now no one has seen the Mignonette in a wild state. The so-called Mignonette belongs to quite a different species."

PARADISE STOCK FOR APPLES.—Our readers may recall what, from our own experience, we have said respecting the above stock for dwarf apple trees. The London Chamber of Agriculture has the following: "The Paradise stock appears effectually to moderate over-luxuriance of wood-growth, and to concentrate the energies of the tree on fruit and fruit-buds. We need scarcely enumerate the advantages of planting this class of fruit in gardens of all kinds, more especially in those of limited extent. Even a good selection of kinds for various seasons may be accommodated in the smallest of gardens, for if kept closely spurred in they may be planted as closely as gooseberry or currant bushes. A few dwarf apple-trees on the true Paradise stock, as single specimens on grass, or as centers to beds, might be tried in even the smallest of gardens."

THOROUGHBREDS.—The Western Rural says that while it has been a steady advocate of thorough breeding, when it can be done without serious inconvenience and profitably, it has never been blind to the fact that a good bull which is the get of a good thoroughbred animal and out of a grade or common cow of good merit, is better than a thoroughbred bull, which is the get of a poor thoroughbred bull. In the midst of the enthusiasm which has attended the business of thorough breeding in this country, the merits of anything but the thoroughbred have been largely lost sight of, and the fact of the animal being a thoroughbred has too often been regarded as a sufficient recommendation without inquiry as to its individual merits or its ancestors'.

HILLING VS. DRILLING CORN.—"Waldo" says, in the Ohio Farmer, that the more he experiments with it the less he likes drilled corn. If he could always do the plowing himself and choose his own tools, he could get a field of drilled corn tended well, but it is hard to get hands to do it rightly. He is satisfied that there will be less corn drilled in the next five years than in the past five. In traveling on the cars, three or four years ago, he paid careful attention to the corn and found it the rule to drill and the exception to hill. Recently in traveling he counted one hundred fields, eighty-three of which were hilled and seventeen drilled.

A SHREWD FRENCHMAN.—It is well known that M. Menier, the Paris chocolate manufacturer, has made a fortune, but it may not be so generally known that a furious letter from a customer gave him the push that started him up-hill. This letter denounced Menier's chocolate as a fraud, because after being kept for some time it turned white. Next morning it was advertised in all the Paris papers: "Buy Menier's chocolate—the only chocolate which turns white with age! See that you get no other! Keep a cake and test it! The only conclusive test of excellence!" And so on, and he was soon wealthy.

THE BOUNDARIES OF SCIENCE, the Journal of Chemistry remarks, are extended positively by only a few men; while there are many chemists and geologists and astronomers and biologists, there are few real investigators,—few that add anything to the sum of actual knowledge. . . . . Exalted genius may be bestowed upon a man, but without cultivation it is dormant and useless. Instances are known in which rare natural gifts have not been developed in the possessor until late in life, and then only through necessity urging to unusual and distasteful exertion.

TIMELY.—The London Farmer has the following: "A capital plan of protecting horses and cattle from the tormenting attacks of flies in hot weather, is to wash their coats in the morning with a decoction of walnut leaves, the peculiar smell of which effectually keeps the would-be marauders at a distance. The decoction is said to have the further power of destroying any eggs that may have been already deposited in the skin."

STINGS.—"Still another remedy for the *certain* cure of bee stings! Take a fresh tomato leaf, crush it, and rub upon the part stung. The pain will disappear immediately, and without the slightest trace of swelling. We would like to be able to transmit to posterity the name of the discoverer of this method."—*L'Apiculteur.*

WHITE HOUSES AND GREEN BLINDS.

A GREAT many sneers have been expended upon the "cold, precise, uninviting appearance" of the white houses and green blinds shut close, the neat lawns, and shading elms and evergreens so characteristic of the better-to-do people of the United States, and it is true that the world has no such example of the order, neatness, pride and good taste as this of the common people, the farming and village population of America. There may be an improvement upon these in the more numerous gables and French roofs, greater ornamentation and number of porticos and verandas, and the blended tints of cottage and railroad colors, which have been adopted in the places of rapid growth, railroad stations, and new western towns, but the cleanly, comfortable, substantial white house, where timber is abundant, and the brown red brick house farther westward, are still the indications that intelligence, industry and civilization are present. In these the United States are leading creation, and no American but look with pride upon these indications of thrift and enterprise, and, when seeing them, he unconsciously says to himself that the church-spire and the capacious academy and college are not far away. He knows, too, that the machine-shop, the implement-factory and planing-mill are near by, because there is a demand for their products. He feels in his heart that the newspaper, the telegraph, the steam-engine and iron horse, the thoroughly tilled fields and the sleek cattle and horses, and fat hogs and sheep, are all there, merely because there seems to be a demand for them.

The value of land where white houses are occupied by the farmers ranges from $100 to $250 per acre, while in the vicinity of wood-colored houses it can be bought for $25 to $50 per acre, and with the presence of block-houses and shanties, for $2.50 to $10. In every respect the land may have been the same when taken from nature's hand, and still the lowest-priced may be nearly, if not quite, as fertile as the high-priced, but the difference is in the enterprise and what man has done for the locality. Build houses, schools, churches, factories and establish reciprocating industries and railroad facilities, and the price of the land is doubled and quadrupled. The presence of a manufacturing village of five thousand will again double and triple the value, and a city of ten thousand increase it ten fold, while the advantages and conveniences of society, association, and of markets, will be of a value beyond estimation.

It only requires one enterprising individual to set the example of a neat house and surroundings, and of only three or four to organize a village improvement association, and invite industries to build thus some ten thousand city.

S. BOYCE.

WORK FOR THE HOGS.

HAVING a rough, stony piece of ground, too poor to grow grass and partly covered with young wood, and wishing to fertilize it, and at the same time to rid it of weeds and brier-roots, and not being able to plow it, a drove of hogs were yarded upon a couple of acres at a time, and a little corn scattered now and then in places where most rooting was desired, and the hogs completely dug over the ground, and were from time to time removed to other pieces. After removing the hogs the ground was raked over, the stones and roots removed, and clover and Orchard-grass and Blue-grass scattered, and two years afterward there was a growth of grass equal to two tons to the acre upon the ground.

This is practicable for large or small lots, using a large or small number of hogs, and under the trees of a second growth of timber or in an orchard, as may be desirable, but the bushes should be mown and the timber must be so thinned out as to allow grass to grow, if pasture is required. If water cannot be brought to the ground, then a lane leading to a supply must be provided. S. S. B.

AN OLD BUT GOOD REMEDY FOR GAPES.

Among our farmers there is a great increase of attention to poultry. Improved breeds are taking the place of inferior fowls, the Leghorns taking the front rank in most cases hereabouts. The results are seen in better feeding, larger flocks, improved houses, and, of course, larger profits.

I would recommend to RURAL readers the following as a sure cure for gapes in chickens. It has been tried repeatedly by myself and several others in this neighborhood, and has always proved effectual: To every hundred chickens take three teaspoonfuls of tincture of asafœtida and mix it daily in their food. There's no patent on this—'tis an old remedy for the ailment.

Malone, N. Y. W. G. H.

The Vineyard.

VITIS VULPINA, SOUTHERN FOX, OR THE CLASS OF THE SCUPPERNONG GRAPES.

D. S. MARVIN.

THE uses for which this class of grapes may be utilized in hybridizing and mixing with our other classes of northern Grapes, have not been appreciated. They are called the lazy man's Grapes, allowed to run at will over rude post and pole trellises a few feet above the ground, are generally untrimmed and otherwise almost uncared for; yet they yield heavy annual crops. The clusters are small, but the berries are large. They flourish only upon the low, flat lands of the South Atlantic sea-board, from Virginia to Texas. They possess a rich, juicy, vinous flavor, are without pulp, and have a coarse, thick skin. They are a good table grape; and probably, for certain wine purposes, they are unsurpassed by any other native or foreign grape, and, what is of vital importance, they seem to be more nearly exempt from all sporadic diseases than any other known sort.

When we add to these merits the other important characteristic, that Vitis vulpina is the only Grape comparatively exempt from the insidious depredations of Phylloxera vastatrix, it would seem that it should be made to come in and supplement some of the leading deficiencies of our other classes of foreign and native Grapes; for none of these flourishes in such low malarial districts, and all are more or less affected by Phylloxera vastatrix. If, by careful and judicious mixing and hybridizing, we can avoid or cure these defects, great good will result to our agriculture. Should we attempt this by grafting the Eumelan—an æstivalis grape, and one of the very best for this purpose—upon Scuppernong roots, using pollen for hybridizing from Concord and others of our popular Labrusca grapes, the root-power of the V. vulpina, acting upon the sexual functions of the pistillate and staminate organs of the other classes, should give us the highest attainable immediate results. Then these improvements should be followed up by again building other combinations, using for the purpose Vitis cordifolia vines in some of the experiments, as a new element, and varying the old combinations, so as to obtain root-power from one class, staminate, pollen, or male principle from another, and pistillate, or female force from a third, doing all with the greatest care and utmost possible precision,

There would seem to be no apparent or sufficient reason against carrying out these important suggestions. They should by all means be attempted; for if the best elements of the Southern can be united with the good that is in our Northern classes, one would supplement the other's deficiencies, and wonderful practical results would doubtless fitly reward and crown the skillful operator.

But herein lie the difficulties: horticulturists who understand the subject, and who have spent the necessary time in studying out its surroundings and bearings, and in acquiring the skill needed for such delicate manipulations and operations, from the very nature of their employment are not usually men of sufficient means to be able to go into the climate required, and devote the necessary years of time attending to such enterprises. Indeed, it would be well that any person who may be employed on such a labor, should be freed from all other cares, and be in this way enabled to lay aside all thought of other business, in order to devote his exclusive attention to the work in hand in studying it out more deliberately and carefully in all its intricacies and bearings. The peculiar exigencies of this department of our agriculture would seem to demand this. Such a person would find ample occupation for all the physical and higher faculties to which man is capable of attaining. Carrying on a commercial grape-vine nursery in these hard times, to my certain knowledge, does not afford sufficient time for such work. I would therefore earnestly commend the subject to the Commissioner of Agriculture, for Washington is situated in the region where these important experiments can be best conducted. The several Southern agricultural universities endowed by the Agricultural Act in the Southern States, should also give careful attention to so important a subject. Moreover, private individuals in the region indicated, who are situated so as to be able to experiment, should by all means do so. There might be fortune and fame in the first experiment, with the consciousness of having been of use in the world thrown in.

It is a mistake to say that the Scuppernong will not live in the North, as we have all repeatedly been told. Though residing in the forty-fourth parallel of latitude, I have three vines, set out three years ago, protected by a slight covering of earth during winter, just as other vines are protected in this climate. They are making a rather slow growth, but seem healthy. I am not entirely without hope that I may be able to utilize the roots by grafting to obtain root-power, although disappointed in my first intention, which was to utilize them to obtain pollen for hybridizing. The difference in climate, however, is so great that, at this date—the 20th of July—they are just in blossom, entirely too late for hybridizing, but during the coming spring the attempt will be made to graft them. Pollen sent from the South next spring could be used, and if some horticultural friend will send this, I shall be duly thankful.

There is some uncertainty; but it may turn out that all the benefits can be obtained from root-power. It is a fortunate circumstance that this power of grafting can be utilized in these operations; for it is far greater, more potent, and more under control, than any power in the hands of the breeder of domestic animals. The horticulturist is enabled to take short-cuts towards final results; the breeder, with but two individual animals at a time, must work for generations through the sexual functions and ameliorating circumstances of food and climate. If he could dissect the osseous structure and the form of the best of the Short-horns, splice into it the viscera of an Ayrshire, add the lacteal organs of the Jersey, and breed from such imaginary animal, it would be something like what the horticulturist is enabled to accomplish through the means of grafting and hybridizing.

Jefferson Co., N. Y.

[Any readers who have not seen Mr. MARVIN'S former articles, which we deem of much importance, and who desire to continue the subject, are referred to the RURAL NEW-YORKER of April 13 and June 29, last.—EDS.]

Floricultural.

POND LILIES.

WILLIAM FALCONER.

JUST now we have white, blue, red and yellow Water-lilies, all blooming freely in our pond. The white ones are Nymphæa odorata, so plentiful East, and N. tuberosa, a much larger but almost scentless species indigenous West and South, and, of course, both kinds are perfectly hardy. The others are tender; that is, we must take them in-doors in winter, and put them out into the pond in summer. The blue-flowered one is the Blue Lotus of the Nile, N. cærulea, a beautiful and fragrant species that throws up its flowers several inches above water in the daytime, but recalls them as closed buds beneath the water's surface at night. The red one is N. Devoniensis, a most beautiful carmine-blossomed hybrid, raised in 1851 at Chatsworth, in England; its parents being N. rubra and N. Lotus (white). Its flowers and leaves are larger, and its constitution stronger than those of either of its parents. It opens early in the morning and remains expanded till noon; its blossoms are thrown up several inches above the water, and by their brilliance and large size, are observable from a considerable distance; and it has the excellent quality of blooming all the season long without intermission. The yellow one is N. lutea, the true yellow Water-lily. It is a native of Florida, and was brought to notice by an engraving of it in Audubon's "North American Birds," some fifty years ago. Otherwise it was practically unknown, and remained so till two or three years ago, when it was rediscovered by Mrs. Treat, who sent many roots of it to the Botanic Garden here. So its existence is no longer a myth, but a reality. Its blossoms are a good yellow, rather medium-sized, and they open later in the morning and remain open longer in the daytime than the other tender sorts. Judging from garden-grown plants, it is altogether of medium size, but a free and continuous bloomer, and thrives well in a tub of water in a sunny corner of the greenhouse, where it blooms well in spring. Of course, the hardy Lilies are growing permanently in the pond, and need little or no care, beyond thinning them out when they overcrowd one another.

The tender Lilies are growing in 12 and 14 inch-wide pots, filled with a compost of rough, turfy loam, and sharp sand. Pond Lilies grow and flower better when not in over-deep water, consequently we raise the pots to within 8 or 12 inches of the surface of the water, by standing them on inverted pots, bricks, or other pedestals. And they grow amazingly. But the bull-frogs bother us a good deal; they seem to think the pots were set there as chairs for croaking water-men; at least they occupy them as such, and nothing short of a stone on the head will dislodge the unmannerly starers, and then they only leave the one pot to peer at you from off the next one.

On the approach of fall frosts, we take our Lilies in-doors and set them in a tank of water in the greenhouse, there to remain till next May, when, after being repotted, they are again transposed to the pond. But it is not necessary to leave them in their big, summer pots; the roots may be taken out carefully and put into as small pots as they can be conveniently lodged in, and in this way a number of plants can be wintered in a tub of water. They should be wintered in a light position and where the temperature does not fall below 40°, and, if practicable, 45°.

Industrial Implements.

THE UNION RAILWAY HORSE-POWER, made by Wm. L. BOYER & BRO., Philadelphia, Pa., has secured its success by slow degrees, but the result is of a most substantial kind, and the Power grows in popularity each season. The salient points claimed for this implement by the Messrs. BOYER, are great: power, very low elevation, substantial workmanship; a power in which cross rods are dispensed with, thus greatly reducing weight, and that the chain joints are hardened, and will wear a great length of time.

THE "Chautauqua" tin-lined butter package seems to be the coming package for the trade. It is spoken of highly, and its sales are steadily increasing. The tub is made in convenient sizes, will not rust, keeps the butter nicely without discoloration, obviates deductions for tare, and is as cheap as ordinary tubs, firkins, etc.

The Querist.

ANSWERS TO CORRESPONDENTS.

Fistula

R. Saunders, Essex Co., Va., asks: Can you, or some of your many readers, give me a remedy for a horse that has a bad sore on his neck, occasioned by being bruised by a careless driver? Some horsemen call it fistula.

ANS.—As we have stated before in these columns, the main point in treating a fistula is to get a dependent opening through which the pus can escape from the sore. It is necessary to find the bottom of the channels by probing, and then to cut down upon this point in such a way as to obtain the above condition. A seton may then be inserted to prevent the lower opening from closing before it is healed above, and astringent lotions may be applied once or twice a day. These may be made by dissolving one-half drachm of either sulphate of zinc or acetate of lead in half a pint of water; some prefer a solution made by using one-half drachm of the above astringents to half a pint of water. In some cases it is necessary to scarify the walls of the channels with a long, narrow-bladed knife, or to destroy their inner surface by caustics before they can be induced to heal. The caustic should be the last resort, as such sores are often needlessly enlarged and deepened by cauterizing, when this is not indicated.

Solution."

Dennis Farrell, Big Stone Co., Minn., asks the meaning of the term "Solution," and well remarks that it is often used very indefinitely.

ANS.—For a substance to be in solution in water or other liquid, it must be so intimately combined with it that the liquid shall be perfectly transparent, and that no separation or deposit shall occur except on change of temperature. When a liquid has taken up all the solid it can dissolve in this way, at a given temperature, it is said to be saturated. Most soluble solids are dissolved more readily and generally more liberally in hot than in cold liquids. When a substance is very soluble at a high temperature, and less so at a lower one, a portion of the substance is deposited as the liquid cools. For instance, a pint of boiling water will dissolve over a pound of alum, but when the solution cools, more than nine-tenths of the alum again assumes a solid form. The more finely the solid is divided or powdered, the more rapidly is it dissolved in any liquid; and to bring each of these minute sub-divisions into contact with fresh globules of water, the liquid should be stirred until the solution or saturization is complete. The expression, "a solution of lime as thick as cream," and similar remarks are therefore inaccurate; for such a mixture is no solution; so is the phrase, "a solution of starch in cold water;" for starch is quite insoluble in cold water, as may be readily seen by every particle of it that may have been stirred into the liquid settling at the bottom when at rest. Nearly all the lime stirred in water to make it milky, is deposited in the same way, when the water has had time to rest; a pint of pure water being able to hold only eight grains of lime in solution.

Cows Chewing Bones.

H. G. T., Round Mountain, N. C. asks, 1, whether it would be right to feed ground bone to cows to prevent them from chewing bones. 2, the names of firms that sell bird-cages and import canaries and gold-finches.

ANS.—It happens not unfrequently that there is two little bone-making material in the food of cattle. Among other ways in which this deficiency is shown by the animals, is an unhealthy appetite leading them to chew bones, wood, and various kinds of refuse. In such cases small rations of bone-dust given with their other food have a decidedly good effect. 2. Among the best firms dealing in bird-cages in this city are: O. Lindemann & Co., 254 Pearl St., and Osborn Mfg. Co., 79 Bleecker St.; well-known bird dealers are: Conrad Betz, 127 Liberty St., and Charles Reiche & Bro., 55 Chatham St.

A Turkey-cock's Harem.

R. H. Lymer, Page Co., Ia., asks how many turkey-hens can be kept to one male, where the eggs are wanted for hatching.

ANS.—Many consider that the number of turkey-hens allowed to one turkey-cock may be unlimited, on the ground that one visit of the cock will render fertile all the eggs laid by the hen. The best breeders, however, have learnt from close observation, that when even twenty hens are allowed to one cock, the chickens from their eggs are apt to be weak in constitution. Accordingly the best practice allows only about a dozen females to one male bird. The turkey-cock may be used for breeding when two years old, and the hen when only a year; but both are in their prime a year later, and, as a rule, they will be first-class breeding stock for two years more, at the very least.

Rouen and Aylesbury Ducks.

E. Mansfield, Westmoreland Co., Pa., asks—What is the relative weights of common, Rouen, and Aylesbury ducks.

ANS.—As a rule, a good-sized, common duck, weighs from six to eight pounds per pair; the average of Aylesburys is over ten pounds, while fair specimens of Rouens should be at least two pounds heavier than these. At the English poultry shows specimens of Rouens often weigh fully nineteen pounds, with Aylesburys only a little behind them.

Ration of Indian-meal for a Cow.

An amateur farmer, New Brunswick, N. J., asks how much corn-meal can be profitably fed to a cow per day.

ANS.—If intended to be fattened, she should be gradually accustomed to eat more and more, so long as her appetite remains keen, her health good and she gains in weight steadily. In all cases, the amount a cow can eat depends on her size, as experiments have pretty conclusively shown that there is a uniform ratio between the size of an animal and the quantity of food it will profitably consume. A large cow if fattening, would probably eat a half a bushel of meal a day for some time; but it would not be well to feed so much to a milch cow. The ration should be decided by a little experiment, by being increased until she shows a tendency to become too fat. It will vary considerably with different breeds of cows, and with different individual animals, as well as with the kind of pasture on which they are kept, and will range all the way from four to ten quarts.

Honey-Locust Hedge.

C. O. Gilkey, Plainwell, Mich. asks, where he can get Honey-Locusts cheapest, and how much longer will it take to get a hedge of them from seed than from purchased plants.

ANS.—The nearest nursery should prove the "cheapest place." Plants one year old will cost about $3.00 per thousand; two years old $5.00. It will take one year longer to get a hedge from seed than from purchased plants. It is best to scald the seeds. Sow in a seed-bed and transplant to the hedge row. We would remark that much of the efficacy of Honey-Locust hedges will depend upon the distance at which the plants are set apart and their being kept well back by timely pruning.

Eastman's Business College.

Willis Risler, Stockton, N. J., asks whether Eastman's Business College is a reliable institution; and whether, when one pays his money there in advance, the authorities would see him through all right, if he paid proper attention to his studies.

ANS.—This college is one of the best in the country, and those having it in charge are certain "to see a man through" honorably to the full value of his money.

Miscellaneous.

J. L. S., Attica, Ohio, asks, 1. Why some reader of the RURAL doesn't write an article or two on the management of bees; 2. Will pear trees bear pruning the same as apple trees, and if so, at what season of the year; 3. What will prevent sprouts coming up about the bottom of an apple tree; 4. What effect will half-rotten sawdust have around an apple tree, if applied in the fall; and will it pay to haul it one mile.

ANS. 1.—The RURAL has so many departments that it cannot always do justice to those who are especially interested in any one department.

2. Yes, we know of no difference. For your climate, we advise pruning during that period of the spring when it is reasonable to suppose that very cold snaps will no longer occur, and before the swelling of the buds.

3. Often in the case of grafted trees the stock is more vigorous than the cion or the union is not perfect. The suppressed vigor will seek to expend itself in the formation of sprouts. We knew of no other way but to rub off the shoots as soon as they appear.

4. We should not use it at all for this purpose.

E. H. H., Cedar Mills, Minn.—Plants for name: Orchis spectabilis; Calystegia pubescens.

Mrs. H. W. Burton, Lincoln Co., N. C. wants to know what to do with her Fuchsias. They are covered with red insects too small to be seen with the naked eye, but large enough to suck all the sap and vitality out of her floral pets whose leaves soon drop off.

ANS.—Sulphur fumes will exterminate the red spider which, we presume, is what infests these Fuchsias, but it is a dangerous remedy. Frequent syringing with a solution of whale-oil soap is effectual, syringing the under as well as the upper part of the leaf.

W. R. Glenwood, Ind.—A. R. Yates, Round Pond, Me. and others inquire who has Duroc Swine for sale.

ANS.—We profess to be very careful as to the class of advertisements we admit into our columns. But so far as many of our readers are concerned, this would seem to be of little advantage. The advertisement of Duroc Swine offered by a very trustworthy gentleman, appeared in our columns when these inquiries were written, to which numbers we refer our inquirers.

Anon, Ithaca, N. Y., asks: 1. For a recipe for good, cheap paint—lead color. 2. Information about Diamond Spring Wheat. 3. Price of RURALS from New-Year's until July 1st last.

ANS.—1. We could answer the question better if the purpose for which it is to be used had been stated. Raw and boiled oil with one-fifth of benzine, using the red mineral powders instead of white lead, and shaded with lamp-black, is the cheapest and most durable paint we know of, if oil is to be used at all.

2. It is Triticum Polonicum of African origin, and has been cultivated in Egypt and other portions of Northern Africa, from early times. The March number of the American Agriculturist, after a careful investigation, exposes the whole thing.

3. We cannot supply them.

Everywhere.

WESTERN NOTES.

THE harvest in northern Illinois and throughout the northwest is progressing as fast as possible, considering the late hot weather and the tangled and prostrated condition of the grain from storms. For the past ten days the weather has been cooler and more favorable, and the harvest will soon close. The crops are variable, and not as good as was anticipated.

CORN was very backward and unpromising until about the middle of June, when it commenced improving, and has since been doing well. It is now mostly in tassel, and should the rest of this season prove favorable, the crop may be a large one.

POTATOES are also "doing well," and are quite abundant, but worth only 25 cents per bushel in our markets. The Colorado beetles threatened to take the crop on communistic principles, and devour it among themselves, but a little timely hand-picking, and sprinkling the infested vines with Paris-green, subdued the bugs and saved the potatoes. One tablespoonful of pure Paris-green to three gallons of water, mixed and applied with a common sprinkler or watering-pot, is the right quantity and way to do it.

FRUIT in northern Illinois is not as plentiful as appearances indicated at the time of blooming. We had some cherries, a good many berries, currants, etc., and will have a light crop of apples, and a few plums and grapes.

LIVE STOCK in general is in good condition, but a large number of horses died during the late heated term from over-work in the excessive heat.

STEAM WAGONS, two of them, have been constructed in Wisconsin, and were tested last week, and it is thought they will be able to stand the hottest of hot spells without sweating. They will run on common roads, draw heavy loads, plow and do general farm work. Verily this is an age of progress, and Edison is not the only inventive genius in America!

THE ILLINOIS STATE FAIR will be held again this year at Freeport, Stephenson County, in Taylor's Driving Park. The site is one of the best in the State and can scarcely be excelled anywhere. Last year the Fair proved a grand success, and it is thought it will be still better this fall, as special preparations are being made for it. Competition is open to the world, and we would be glad to see New York State represented again. S. D. Fisher, of the State Board of Agriculture, Springfield, Illinois, has recently issued the premium list, which he will send free to any persons wishing to attend the Fair or compete for premiums. The exhibition begins on the 16th day of September, and this would be a good time for Eastern people to visit the West and see our beautiful prairie-land and western products.

DAIRYING is spreading and improving in the West very rapidly. A large number of creameries and cheese factories have been built the past spring. The National Butter, Cheese and Egg Association is doing much toward elevating the standard of the American Dairy and improving its products, through its meetings, dairy-fairs and published reports.

W. B. DERRICK.

Ogle Co., Ill., July 30.

WEST VIRGINIA NOTES.

THE KANAWHA VALLEY.

CHARLESTON, the capital of this county, is situated on the Great Kanawha River, about fifty miles from the mouth, and, with a population of 7,000, is the second city in the State. The city stands in one of the most beautiful valleys in the State and is surrounded by mountains that contain inexhaustible supplies of coal, iron ore, and timber. As to the coal deposits, Kanawha County has few equals and no superiors in the Southern States. From Charleston to the Kanawha Falls—a distance of thirty-five miles—there is a continuous line of towns and villages, nearly all mining hamlets. The mines are mostly near the river and railroad, giving the companies little to do but to dump the coal into boats and cars. The Chesapeake and Ohio Rail Road enables coal companies to ship their coal East as well as West. Before it was built, coal was shipped exclusively West, to cities on the Ohio and Mississippi rivers. It is now shipped East where there is always a good market for it.

FARMING.

Farming is carried on to a considerable extent in the valley and hills, but the land, as a general thing, is very poor, having been worked for years in corn, wheat, and oats, without ever having a blade of grass on it. Why this has been so, I am unable to see, as hay is worth as much here per acre as any grain that can be raised on it, and does not require one-third as much labor, while it makes the land rich, killing the briers that have a tendency to grow on a poor soil.

Stock is not raised much here, as a rule, yet there is no valid reason why it should not be. Scarcity of land certainly could not be a reason, for within three miles of Charleston, hill land can be bought for five and ten dollars per acre, that will produce blue-grass in abundance. How much easier it would be for the farmers, if they would raise more stock and less grain! Wherever you see a farmer that raises stock, you generally see a good farm and a prosperous farmer.

D.

RURAL SPECIAL REPORTS.

BLOOMFIELD, Ct., Aug., 1878.

DEAR RURAL:—My ramblings have again brought me to this place, from which I had the pleasure of inditing a few epistles to you last year. A New England country town has little more change from year to year than have the stony features of the Old Man of the Mountain. The wider spreading branches shut out from sight some bit of landscape that has been familiar, and the absence of some old trees that have been landmarks for years, teaches lessons of growth and decay more forcibly doubtless to me than to those who live here. And so with faces. I meet the children of those I knew as children, and I miss the faces of their fathers. I look in vain for the old men I once knew. They are gone, and in their places are men, gray-haired and bent, it is true, but can they be old? It seems but a little while ago when, as a boy, I knew them as the young men of the place—then, as now, but a few years my seniors—and am I, too, growing old? Perhaps so. * * *

The season has been favorable for crops of all kinds. The frequent showers gave an abundant harvest of grass, which may be considered the staple production of this vicinity, most of which is cut, cured and housed. The warm weather of July seems to have made amends for the coolness of June. Rye and oats ripened speedily, and corn is growing apace. Tobacco, of which considerable is grown, notwithstanding its low price, is spreading itself, and some pieces already hide the ground from view. In another month it will be ready to cut. Is there any other crop that produces so much weight in the same time as this? The idea that it ruinously impoverishes the soil on which it is grown, is exploded. True, good crops cannot be grown on poor soil, nor can they be successively grown on the same land without application of suitable fertilizers, but it leaves the ground in good condition for any other crop.

Fruit is looking moderately well. The earlier apples, such as Germanboughs, Strawberry, Red Astrachan, Golden Sweet, etc., are marketable, but at small prices, say one dollar a barrel. The last-named originated in this vicinity, and in bearing years, thousands of barrels are marketed. Until recently the original Golden Sweet tree could be pointed out and although there is little doubt all trees bearing the name are more or less direct from the original stock, there is a vast difference in the fruit, while all have the general characteristics of the original to such an extent as to leave no doubt it is properly named. But it varies a little in size, juiciness, flavor, color and time of ripening. When asked for an opinion as to the causes for this variation, I say, situation, soil, and, more than either, the stock upon which it is grafted or budded. Why will not fruit growers root-graft more freely when they desire to propagate good varieties of seedlings in their purity?

HIGHLAND CREAMERY.—The proximity to Hartford, the nearest market, and the demand there for milk and butter, have induced many of the neighboring farmers to become dairymen on a more or less extensive scale—those nearer by taking milk to customers, and the more remote by making butter which is served by the season, usually at a price a few cents in advance of store rates. Recently the Highland Creamery Co. has been established a little way from here (West Hartford P. O.), which already somewhat changes the complexion of affairs. It is found more profitable for the farmers near by to sell their milk to the creamery at a reduced price (say two cents a pound) than to peddle it, or make butter. I had the pleasure of visiting the creamery recently, and found it not very extensive (making, say, 150 pounds a day), but a model of neatness. By their arrangements, which I should like, would your space permit, to describe at length, [Our space *will* permit.—EDS.

they make more and better butter from the same quality of milk than could be done at the farm-houses. They find it profitable also not to wait until all the cream has risen before skimming, leaving a portion in the milk. For this skimmed milk they received 1½ cents a quart from peddlers, who (at least *some* of them) sell it in the city as skimmed milk at one-half the price that new milk commands. We hear from those who have used it that it will keep sweet longer than new milk. If this is so, why?

The managers of the creamery have a custom of filling test glasses containing samples of milk from each producer with his name attached, and letting them stand in a prominent place for the cream to rise, thus showing at a glance who has the best cows. A commendable spirit of emulation will necessarily arise, each man will strive to be ahead of his neighbor, the grade of cream-producing cows will be raised, while the creamery company, with Yankee cuteness, will reap the profit by getting more butter from the same quantity of milk. L. A. R.

HURON CO., Ohio, Aug. 1st, 1878.

EDITORS RURAL NEW-YORKER:—Harvest being nearly over, a close estimate can be made of the present crop. Wheat is an average crop; it would have been an immense one but for the May frosts. Much of it is threshed and marketed from the machine at 85 cents per bushel. Oats are light, and continued wet weather has prevented harvesting until they are over-ripe and shell badly—not over two-thirds of a crop. Corn, of which a little below the average acreage was planted, will be a good crop. Pastures good. Meadows below an average yield. Potatoes very light, injured by blight. A heavy crop of apples and an abundance of other fruits. Prices lower, but labor cheaper and more plentiful, while prices of what we have to buy have fallen nearly in proportion to prices of produce. On the whole, a prosperous season for farmers. E. L. M.

CLINTON PLACE, N. Y., Sept. 3.

SORRY, very sorry am I to see that you will lend a hand towards getting puss in trouble. Never did I see a more one-sided effort than that of last week's RURAL. You gave one illustration of Jack's good traits and none of Tom's, while for the latter you depicted many of his naughty ones. I hold that the good qualities are about evenly balanced, and as for *bad* ones, give me the cat every time in preference. I hope to see no more of this preaching taxation on cats from you. Castrate the male dogs, and do your best to do away with their wholesale slaughter. Save, of course, those wanted for breeding purposes, as has been proposed in one of the papers.
CLINTON PLACE.

Various.

THE AMERICAN ART UNION SWINDLE.

THE snares laid for entrapping the very foolish are not constructed with conspicuous ingenuity, yet their success is a melancholy proof that thousands live in an Arcadian simplicity, with a trick of opening wide their mouths, like young crows, and swallowing everything that is presented without stopping to taste.

Where such an appetite exists, it is only natural that food should be provided for it, and thus it happens that the American Art Union of Cincinnati has prepared a circular, which of itself, may be catalogued among their other works of "art."

This announcement proclaims a generous deed. It is nothing less than that "in consideration of the success we (they) enjoy as publishers of works of art," they will, prompted by an uncontrollable impulse of generosity, born of the aforesaid success, actually give away 265 original oil paintings by distribution among their customers. Now this is truly generous. Such munificence is confined to millionaires like Mr. Lennox and the American Art Union. We are told that thousands might be realized by the sale of these gems, even at auction, but a spirit of true generosity forbade such vulgar barter. They must be a free-gift offering.

The philanthropists were anxious to give a picture to each of their 26,500 patrons, but the entire "gallery" numbering only 265 (peculiarly fortunate combination of numbers), it was decided to take every one hundredth name in regular order. The circular continues——

"Your name appearing in regular order, you happen to be one of the *lucky* customers, and we take this method of notifying you that you are entitled to one of the Oil Paintings. Upon receipt of the inclosed certificate, carefully and plainly directed to us, it will be forwarded to you promptly. We shall immediately notify the balance of our patrons of our action, and, in the accumulation of paintings that must occur each year, can only hope that they may be the lucky ones next time. We know that some of our largest customers—many of whom are our warm personal friends—will feel disappointed at not receiving a Painting; still we feel proudly conscious that this is the best, and only fair way, of dealing with all, whether customers on a large or small scale."

Such proud consciousness could not fail to gratify even their warm personal friends, and as for "the lucky customers,"—well they expressed their sentiments probably after receiving one of the "choicest works." We have had the pleasure of conversing with one of the "customers," a friend of ours, who sent for one of the pictures as an experiment whose gratitude was abundant, as were likewise his epithets. In the language of the circular, "their grandeur and sublimity strike one with awe and wonder."

Having concluded to give away these "extravagant and unprecedented gifts," they may be pardoned, surely, for indulging themselves in a little selfish pleasure, so we are gleefully told that the entire scheme "has been framed and carried out so far without the knowledge or concurrence of a single one of our (their) customers, and is intended to be an agreeable surprise." Therefore, the first intimation the lucky art-worshiper has of his fortune, is a certificate and a circular. He is expected to fill out and return the certificate, because "The Paintings having cost us large amounts, we can only present the same to you *free of charge*, simply asking that you meet the expense of boxing, packing, printing of circulars, certificates, etc., etc., which amounts to about $1.85, and which, under the circumstances, you can not hesitate to regard as reasonable. This is one chance in a lifetime of securing a gem Oil Painting, that would add luster to the most elegant and fastidiously furnished home."

Any man who could refuse $1.85 after that explanation is no lover of art, besides if he neglects the opportunity he is lost, as he is told in so many words: "If we do not hear from you in thirty days from date, we will transfer the gift to the next name on our books, and would in this case request the return of the Gift Certificate."

Thus far the victim has been approached on the side of his cupidity, but now his æsthetic longings are intensified by a description of the paintings. The Editor of the Cincinnati Post, and Mr. W. Whitfield, an alleged well-known critic, were corraled and brought in to view the art treasures, and they were captivated. "It was a decided pleasure." "I should like to be the purchaser of some of these paintings myself." "They are objects of special interest to me;" and having seen one, we can well believe it, and he continues, "I hardly think you will be benefited in future business by presenting these Paintings to your customers in the manner you propose; for, of course, many of them will fall into the hands of those who will not fully appreciate their intrinsic value as works of art: while to me they are perfect gems. I lingered long and enthusiastically over the above-mentioned titles, and left them with reluctant steps. One can almost imagine himself in classic Italy, face to face with the exquisite beauty that greets and entrances the senses in that land of wondrous beauty.

"The magnificent mountain scenery, charming little lakes that kiss the sides of verdure-crowned hills as they sparkle and scintillate in the glorious sunlight, and the delicate tints of the fleecy clouds as they float away in a sea of gold and blue, have been seized by the artist and transferred to canvas without losing one iota of their natural beauty. Many of them recall to my mind, most vividly, scenes whose grandeur and beauty I shall never forget."

Who could withstand such eloquence? This poet-editor's diamond-tipped pen must have been dipped "in a sea of gold and blue," when he continued—"There can be no question but that advertising is a prime mover in business, and surely your house must be classed in the front ranks not only for fair dealing, but extended enterprise, and your patrons cannot too highly appreciate your liberality of spirit in making this distribution of oil paintings."

These "prime movers in business" having thus established the intent of "fair dealing," began the assault on the unsophisticated by supplementing the previous documents with a list of names and addresses duly numbered, in which it is stated that each name is entitled to one original oil painting. As there were but 265 gems to be lavished upon the public, and as this list contains 271 names, it is to be inferred that some one enthusiastic member of the Union must have taken a claw-hammer and robbed his private gallery to make up the deficit. Generosity could no further go!

The sequel is simple. The certificate and $1.85 are sent. After waiting impatiently a reasonable time, the picture does not arrive, and a sharp letter reaches the Union, most probably. This is answered by a printed form to meet the case, proving that the delay is a part of the scheme. This circular states that the painting was not sent because the Union was positive he would require a frame for his treasure, and "we think it advisable to mention that we are manufacturers and wholesale dealers in all kinds of frames," and "desiring to accommodate such of the two hundred and sixty-five parties as are the fortunate recipients of the distribution, we decide to supply and ship each and every one the following frames at *cost of manufacture*, namely: No. 1, 2½ inch solid *carved black-walnut*, with gilt lining, at only $1.45 each frame; and No. 2, consisting of a 3-inch gilt frame at $2.00."

Such solicitude is touching, and worthy of an association that can freely give away art-treasures costing thousands.

If the obliged patron concludes to have a frame he gets his picture, framed, by express, having expended $4.35, more or less, according to the kind of frame he selects, and the distance he lives from Cincinnati.

He finds he is the victim of a stupendous swindle. The picture looks as if it was stenciled on glazy muslin, that requires all the adhesive power of the varnish to hold it together. The frame is common, and is charged for at a higher price than it can be purchased of retail dealers.

We have often had occasion to advert to these swindles, including the present one, but we have concluded to give the whole *modus operandi*, in the hope that our subscribers, as well as the general reading public, will be more wary in future, and distrust all schemes that have for their chief allurement the giving of something of value for much less than its market price.

This Art-Union began its career by specious advertisements, in which it was stated that the readers of such papers as contained their advertisement would receive "as a premium" an elegant steel-engraving—"Christ in The Temple"—by remitting 25 cents for postage. Thus were the names received which afterwards are used in the more complicated swindle above described.

CATALOGUES, &c., RECEIVED.

AT this season of the year Strawberry plants are being advertised in our columns and we respectfully call the attention of those interested to such trustworthy firms as F. R. Pierson, Dr. F. M. Hexamer and Wm. Parry whose catalogues or circulars will be mailed free to applicants. Many new varieties of undoubted merit are offered. If we would excel our neighbors in strawberry cultivation, we must be familiar with the best methods, and these are given in the catalogues above referred to without unnecessary detail.

MR. W. T. ALAN of Greenville, Pa., a gentleman whose experience on executive committees of agricultural fairs has given him a thorough insight into their workings, has invented a combined Entry and Committee Book, a sample sheet of which has been sent us. It is a good thing. We cannot go into its merits, but any secretary will appreciate them at a glance. We think it would be a profitable employment of time if they should write to Mr. ALAN for a sample and prices. None more than an overworked Secretary can appreciate the benefit of any labor-saving contrivance about fair time.

A NEW association, the Onondaga Co., (N. Y.) Agricultural Society, holds its first fair at Syracuse, Sept. 17 to 19. This organization comprises many of the best men in the county. Fine grounds and buildings have been secured, and a liberal premium list compiled. Coming a week after the State fair, many exhibitors at that fair will also display their goods at Syracuse.

FIRST Annual Report of the U. S. Entomological Commission for the year 1877, relating to the Rocky Mountain Locust, and the best methods of preventing its injuries and of guarding against its invasions—with maps and illustrations.

THE Grasses of Tennessee including cereals and forage plants by J. B. Kellebrew, A. M., Ph. D., Commissioner of Agriculture, Statistics and Mines. A valuable work of 500 pages to which we hope to refer more in detail.

PRICE List of the Eastern Shore Nurseries, Denton, Caroline Co., Md. J. W. Kerr, Proprietor. An epitome of all the fruit trees (small fruits, grape vines) as well as evergreens, hardy shrubs, etc.

CIRCULAR No. 57. Analyses and statistics of Commercial Fertilizers inspected, analyzed and admitted to sale in Georgia during the season of 1877–8. Thomas P. Janes, Com. Ag., Atlanta, Ga.

LIST of Premiums and Regulations for the Eighth Annual Fair of the Broome Co. Ag. Society, to be held at Whitney's Point, N. Y., Sept. 3, inclusive. Milo B. Eldredge, Sec'y.

PREMIUM LIST of the Marshall Co. Ag. Society for the Twenty-first Annual Exhibition to be held on the Fair Grounds, Marshalltown, Iowa, Sept. 10–12.

RULES and premium list for the Third Annual fair of the Marengo Ag. Society, to be held at Marengo, Ill., 10–13. J. S. Rogers, Sec'y.

POMONA NURSERY, William Parry, Prop., Cinnaminson, N. J. Catalogue of Strawberries, Raspberries and Blackberries, illustrated.

J. L. DILLON, of Bloomsburg, Pa., offers a circular setting forth the merits of the much talked of Sharpless Seedling Strawberry.

A MANUAL of Georgia for the use of Capitalists, prepared under the direction of T. P. Janes, Com. of Ag., Atlanta, Ga. Page 116.

Hygienic Information.

INTERMITTENT FEVER.

DR. GOODENOUGH.

Treatment.

Formerly many thought it best to allow the disease to run its natural course; but now-a-days the opinion is nearly universal that an attempt should be made to arrest it, as there is no proof of morbific matter to be eliminated from the system; and the longer it continues the harder it is to get rid of, and the greater the danger of secondary diseases more dangerous than the original. Generally the paroxysms require little or no treatment except by way of alleviation.

DURING THE CHILL.—The patient should be in bed covered warmly. Hot drinks may be given, such as hot lemonade, toast-water, and an infusion of balm: heated bricks, bags of sand or bran or bottles of hot water may be applied to the feet and along the body. In severe or protracted cases a vapor or hot-air bath may be employed by raising the bed-clothes over the patient by means of half-hoops and placing, near the body, hot moistened bricks wrapped in flannel or introducing a current of hot air or vapor through a conical, round tin tube, at the broad, exterior, bell-shaped end of which a cup of alcohol is burning. There are a number of other remedies in this stage also, especially in severe cases, but these generally require medical advice in applying them.

IN THE HOT STAGE.—The patient should be allowed cold drinks; the effervescing draught every hour or two is especially beneficial; and should materials for it not be at hand, twenty grains of citrate of potassa, dissolved in water, may be substituted. Other remedies in this stage should be used only by advice of the nearest good doctor. In the sweating stage all that is needed is that the patient should not be exposed to cold. Hot gruel and hot chicken broth may also be given beneficially.

INTERMISSON.—This is the time for effective treatment. The bowels should first be thoroughly evacuated, preferably by the use of calomel, as it not only empties the bowels, but also unloads the congested liver. For adults, three or four compound cathartic pills, or from two to eight grains of calomel with a proportionate quantity of jalap, rhubarb or scammony may be employed, or the dose of calomel alone may be followed in six hours by one of sulphate of magnesia or castor-oil. As soon as the bowels are evacuated sulphate of quinia, in doses of two or three grains, every hour or two, either in pills or solution, should be given until from twelve to twenty-four grains have been administered between the paroxysms. To produce a complete solution of the quinine, it would be well to mix in the water twice as many drops of dilute sulphuric acid as there are grains of quinine. Pills, being tasteless, are preferable for some, but a solution is always safer and more effective. Some patients are more sensitive than others to its effects, as shown by noises in the head and partial deafness, and the quantity must be regulated accordingly. Some physicians give very much heavier doses but these are hardly ever necessary.

But when smaller doses do not prevent the paroxysms, recourse should be had to larger ones; and, as a rule, doses are much larger in warm than in cool or temperate climates. The specific should be all taken, say, a couple of hours before the time of the expected paroxysm, so as to allow time for it to get introduced into the system and operate; and when the paroxysms come close together, the doses should be increased so that the proper amount can be taken between them. Some advise that the whole quantity should be taken in one dose, and sometimes this mode has undoubtedly a good effect; but repeated small doses are much safer and more advisable.

Next to quinine the most efficacious remedy for intermittent fever is arsenic, taken with least danger in the form of Fowler's Solution. Indeed, in many cases where the action of quinine is slow or inefficient, that of arsenic has proved curative, but the danger from handling injudiciously so dangerous a substance must always restrict its use. Besides quinine, various other forms of Peruvian Bark are also in use; but concentrated in quinine, the merits of these are in nearly all cases, much more salutary. Other remedies which are also efficacious, but in a less degree, are salacine, bebeerine, ferrocyanide of iron or Prussian blue and strychnia; but in using these the next good doctor should always be consulted.

During the disease diet should be light, digestible, nutritious, but not stimulating, and a full meal should not be eaten within a couple of hours of the expected paroxysm.

By the way, among the preventives not the least effective is always to sleep in an upper room, as experience has shown that the malaria of unhealthy districts always tends to cling to the ground. Statistics show that the proportion of cases among those sleeping up-stairs, is one-third less than among those sleeping on the ground-floor. It is also of great importance that in malarial regions the houses should be built on the highest ground in the neighborhood, and, if possible, at some distance from river bottoms.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY AUG 17, 1878.

We offered, some time ago, to sell the cuts used in this Journal for ten cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

THE NATIONAL DAIRY FAIR.

It will be remembered that during the session of the American Dairymen's Association, at Cleveland, early in spring, a resolution was unanimously adopted authorizing a committee of eleven to organize a National Dairy Fair. This committee, selected with care, embraced many of the men most widely known throughout the country for their skill in the various branches of this industry. In March last, the members met at Utica, and with them, as an advisory committee, representative men connected with the business in different parts of the country, and together they selected this city as the most eligible place for holding the fair some time in the fall.

At the time it was said that doubtless the merchants dealing in dairy products in New York would contribute liberally towards the eight or ten thousand dollars necessary to make the undertaking a success, and the members of the committee resident here have been diligently at work soliciting subscriptions. A fair measure of success has rewarded their efforts, and there is little doubt but that the needed sum will be raised, provided the country districts will subscribe their quota.

A large proportion of the trade here, however, is either positively opposed to the movement for a fair, or displays towards it a discouraging apathy. With a single prominent exception, these hostile or lukewarm dealers belong to the butter trade. The action of these, it is alleged, is based on the opinion that it might injure their business to bring the producers from the country into direct acquaintance with consumers in the city. Should this be substantially the ground of their conduct, it should add one more to the numerous reasons dairymen have for resolving to do all in their power to make this display of their products a grand success; for a closer acquaintance of producers and consumers will benefit these just in proportion as it may lessen the profits of the middlemen. Moreover, by this contact of producers, middlemen, and consumers, the farmers will learn more clearly the needs of the market, the relative standing of the different firms with which they may deal, and the most profitable manner of making and putting up their goods.

To accomplish this object, there will be ample means of instruction at the fair. In it there will be on exhibition specimens of the various kinds of cheese made in this country and Europe; illustrations of the different styles in which butter is put up; samples of the several sorts of apparatus employed in the manufacture of both articles, with models of cheese factories and butter creameries, and, in a word, every thing connected with the dairy business that can instruct the producer or interest the general public. It is to be hoped, therefore, that this grand opportunity of still more popularizing dairy products as well as of impressing upon dairymen the necessity for still greater improvements in their methods and appliances, shall not be neglected through the backwardness of a part of a single subordinate interest.

While we heartily wish success to this undertaking in the belief that it will afford many advantages to the dairymen and to farmers generally throughout the country, we must strongly protest against the introduction here of one feature which has of late been far too prominent in most of the dairy conventions elsewhere. In a very brief time oleomargarine has become a powerful competitor of butter in many markets, while its use is rapidly extending, and the larger the sales of this concoction the smaller will be those of the dairy product. That it can never compete successfully with first-class butter, of course, all concede; but unfortunately all the butter made is not first-class, nor is it likely to be for many a day, and a dairy convention should be even more careful of the interests of the farmers who cannot, or do not, make a prime article than of the interests of those whose product is gilt-edged, and who therefore stand less in need of the instruction and assistance of such assemblies. Now, it is very doubtful whether this class has been benefited by the discussions held at many recent conventions as much as they have been injured by the lavish opportunities afforded thereat for widely and gratuitously advertising the suety preparation which injures the sale of their product. It is not at all improbable that the rapid introduction of this article into use has been more promoted by the elaborate disquisitions upon its nature permitted at dairy conventions and widely circulated in reports of their proceedings than by any other means. Yet neither justice, usage, nor expediency requires that those interested in any branch of industry should, at meetings specially held to promote their own welfare, afford, to their own loss, free opportunities for puffing goods that come into direct competition with their own in the markets of the world.

SHORT-HORNS AND HEREFORDS.

Both in this country and across the Atlantic, the opinion has of late years been gaining strength that too much weight has been attached by breeders of Short-horns to fancy strains, to the neglect of proper regard for the individual merits of each animal. Hence the enormous price that has often been given for some animal of a particular family, whose conformation was inferior to that of a much cheaper Short-horn, belonging to a family less highly esteemed. So far has this craze been carried, that many excellent judges of stock maintain that within the last few years the race of Short-horns has actually deteriorated instead of improving. In England special attention has recently been drawn to this subject by the triumph of two Herefords over all other breeds, at the Bath and West of England Cattle Show, held at Oxford. Of Herefords there were only three at the fair, while of the Short-horns there were thirteen of the bull class alone; yet the Hereford bull, Grateful, was awarded the prize over the Short-horn, Sir Arthur Ingram, an animal famous at other shows and here selected by the Short-horn judges as the best of his race. In the same manner the conclave of judges awarded to the Hereford heifer, Leonora, the championship over the Short-horn, Diana, confessedly the best of the Short-horns at the fair. It would seem that while the admirers of Short-horns have lately been content to dwell on what their favorites have been, the breeders of Herefords have been diligently selecting and mating the best individual animals so as to advance the standard of the breed.

PURCHASING vs. PRODUCING.

Purchasing is impoverishing and producing is enriching: this is a fact quickly apparent to any thinking man, and applicable the same to an individual or to a nation. The nation has lands capable of producting, but idle. The nation pays out $100,000,000 a year for ten years and produces nothing from these lands. She is bankrupt; the land valueless and her money gone. Had the nation produced from these lands $100,000.000 a year for ten years what would be her condition? She would not only have the $1,000,000,000 otherwise expended, but she would be capable of producing indefinitely in the same way; besides $100,000,000 invested annually would in the ten years give her an addition of $500,000,000 more.

It is apparent, too, that the soil would be cultivated, the people employed would have the value in money, land and materials, that those who consumed the productions would have a better market in exchange for their own goods, that taxation would be lighter from the presence of more wealth; and let the same condition go on for one hundred years and imagine the result! And yet the United States are paying out $200,000,000 annually for goods which they have all the territory and idle labor to produce, wanting nothing but the paternal attention of the delegates of the States in Congress or of the States themselves to insure.

THE HOG-CHOLERA COMMISSION.

At the close of the last session of Congress the sum of $10,000 was appropriated for the expenses of a commission to investigate contagious diseases of swine in the United States. Under this provision a commission, consisting of our contributor, D. E. Salmon, D. V. M.; Prof. J. Laws, of Cornell University; Prof. H. J. Detmers, of Chicago, and five other veterinarians, has been appointed by the Department of Agriculture, and the members have received full instructions which are to govern their investigations. It appears that each is to pursue his research es independent of the others, in a line indicated by the Department, and this fact, coupled with the paltry sum that will fall to the lot of each investigator, renders it hardly likely that any beneficial discoveries will result from the project. Apart from the loss of advantages of combined study, the remuneration is so small that neither of the gentlemen can afford to neglect his professional business, a requirement necessary to secure the best chance of success in his investigation. Had the whole appropriation been placed at the disposal of the three well-known experts mentioned above, our hopes of a successful issue would have been stronger.

CO-OPERATION IN PRODUCING AND MANUFACTURING.

There can be no great degree of prosperity in any country where the greater portion of the people are engaged in any one system of industrial operations to the exclusion of others. England has less prosperity because of her necessity to largely purchase her provisions and raw materials, but Russia, the Southern and Western States have had a less prosperity from producing only raw materials or provisions at low prices and having to purchase manufactures at a high price. To be the most prosperous, the raw material and provisions should largely be consumed on the ground where produced and only the high-cost products exported.

The South should manufacture her cotton and wool and hemp and jute, refine her sugar and raise her provisions, as well as raw material. The West should have one-half her energies in manufacturing industries to consume her raw material, and that naturally passing by her and also to consume largely of her provisions, and increase the value of her lands and save transportation. Any nation or any portion of a nation should, after raising food, raise what they can manufacture upon their own territory to advantage.

The Cincinnati Art-Union imposition, details of which are given in other columns, is a greater fraud even than those details set forth. We do not write from hear-say. We may be pardoned for alluding to the fact that while several other journals, which undoubtedly hold a very high place in the regards of the public, accepted and published the advertisements of this swindling Union, the RURAL NEW YORKER rejected them as, for the past thirteen months, at least, it would have rejected any other advertisement upon the face of which "fraud" was written in such glowing letters. And in so doing it did not occur to us that we were extra virtuous either.

Skeleton Leaves.—There are no leaves or flowers, or parts of flowers, that skeletonize more perfectly than the cups (calyces) of the Molucella lævis. No artificial treatment is necessary. The parenchyma decays and disappears even upon the plants, leaving only the fine net-work of fibers. Speaking of this plant, a nice question for those who delight in such minute investigations, is to determine why some of the leaves are vertical, presenting the edges to the sky and earth, while others are horizontal, as in the case of most other plants.

BREVITIES.

We observe a good many twin flowers among our Gladioli this season. Others are "double."

The Germantown Telegraph says, "As well attempt to tame the hyena as the huckleberry."

We have heard some excellent accounts of the Beauty of Hebron Potato. Great size is not claimed for it. Quality, productiveness, earliness and keeping qualities are, and, judging from these accounts, the claim will be sustained.

We are disposed to think from our tests this summer, that the Acme tomato is one of the earliest, and, in connection with its earliness, one of the best. It averages as large as a Tomato needs to be, and is generally without a seam.

The Plymouth Rock breed of poultry is not yet old enough to insure Plymouth Rock characteristics to its progeny. We set one dozen eggs this spring. Seven were hatched, two of which were black without a colored feather. A neighbor repeats this experience.

A terrible warning to those who water their flowers in the morning, as well as to those who marry, has just been afforded by Thompson A. Godfrey, of Ocean Grove, N. J. The aged man married a girl of 22 the other day, and next day while watering his flowers, he dropped dead of heart-disease.

The present is the best time for destroying the Canada Thistle. Cut it off close to the ground. Nothing is gained by pulling it up. Only the perpendicular part of the root *can be* pulled up—the horizontal ramifications remaining deep in the ground. Their roots are perennial—the branches above ground are biennial.

One of the best gooseberries we have had to do with is the Downing. It is an immense bearer and the berries are tender and sweet—sweet for a gooseberry. The branches this season had to be propped up to support the fruit, two-thirds of which, however, were finally scalded by the hot moist weather. But the plants with us never mildew.

Col. Curtis, who is a regular correspondent of the ably conducted agricultural department of the N. Y. Tribune, as well as of the Rural, says: "The enterprising owner shot an owl in his barn and killed him and burned the barn. Whenever it is necessary to shoot a gun around buildings, wool should be used for wadding, as it will not readily take fire from powder." Or, we would suggest, the greased felt wads, now in general use among the sportsmen.

Among the assets of a farmer lately declared bankrupt in Ky., was an elephant which he had some time before bought cheap at an auction of the properties of a circus. In making the purchase he was probably actuated by the same spirit as Mrs. Toodles in buying that door-plate engraved with Thompson with a p; but he suffered more severely than that provident lady, for the elephant soon eat him out of house and home. Many another farmer, too, has been ruined by good bargains in elephants, in the shape of more lands than they can properly manage, patent-rights for which they neglect their legitimate duties and other unnecessary burdens.

An odd Annual.—Many people like odd plants. We know of one "rarely seen in the garden." Though it is not uncommon, it is little known among flower lovers. It grows about a foot high; is not particular as to soil or cultivation. The flowers are of a bright yellow and in diameter three times the length of the leaves!! Each plant will bear over one hundred flowers, we should judge. The main stem is branchless for two inches from the ground. Then it branches freely and the secondary branches are *square*. It is odd in other respects which may be left for those who conclude to cultivate it to determine. It is a St. John's-wort. Its botanical name is Hypericum Sarothra. It is blooming now in many sandy fields and road-sides and will be through August. This is one of the many plants that must be seen to be appreciated—"A word to the wise"—

Orchard in Grass.—An old friend writes us "There is a great deal of nonsense talked and written about apple trees requiring cultivated ground. The reason why the trees do not do so well when the ground is in grass, is because it is not grazed and kept short as it is in England, where all the orchards, or at least ninety-nine out of a hundred, are kept in grass, and never, under any circumstances, plowed. But the grass is grazed with sheep and calves and never mowed, as it is well-known to be wrong to grow what is not returned to the soil in some shape. Americans do not understand the difference between the fine old permanent sod which is never plowed and the timothy and clover temporary grass here. When the sward is grazed in England, there is nothing to prevent sun and air from benefiting the roots, and the sheep lie a great deal under the trees and leave droppings and urine.

Literary Miscellany.

GROWING OLD GRACEFULLY.

SOFTLY, oh! softly, the years have swept by thee,
Touching thee lightly with tenderest care;
Sorrow and care did they often bring nigh thee:
Yet they have left thee but beauty to wear.
Growing old gracefully,
Gracefully fair.

Far from the storms that are lashing the ocean;
Nearer each day to the pleasant home light;
Far from the waves that are big with commotion,
Under full sail and the harbor in sight!
Growing old cheerfully,
Cheerful and bright.

Past all the winds that were adverse and chilling;
Past all the islands that lured thee to rest!
Past all the currents that wooed thee unwilling,
Growing old peacefully;
Peacefully and blest.

Never a feeling of envy or sorrow,
Where the bright faces of children are seen;
Never a year from their youth wouldst thou borrow,
Thou dost remember what lieth between.
Growing old willingly;
Gladly, I ween!

Rich in experience that angels might covet;
Rich in a faith that has grown with thy years;
Rich in the love that grew from and above it;
Soothing thy sorrows and hushing thy fears.
Growing old wealthily;
Loving and dear.

Hearts at the sound of thy coming are lightened,
Ready and willing thy hand to receive;
Many a face at thy kind words has brightened,
"It is more blessed to give than receive!"
Growing old happily;
Blest, we believe.

[*Christian Globe.*

EUPHROSYNE:

AN OLD TALE OF THE NEW WORLD.

CHAPTER I.

IT was a bright October evening in the year 1690, when a group of officers stood upon the topmost point of Cape Diamond, the lofty citadel of Quebec, clustered round the flag-staff, from whose summit floated proudly the national banner of France. The last rays of the setting sun kissed its silken folds as they streamed out upon the breeze, waving defiance to the invaders who threatened to pluck it from the rock on which, nearly a century before, it had been planted by the adventurous Champlain.

Over the beautiful landscape, viewed from the pinnacle of that rock, hung the blue dome of heaven, pure and cloudless; while the horizon burning with gorgeous hues of purple and gold, shed a glory over the scene, such as is never witnessed in milder latitudes. The heads of the distant mountains that guard, like giant-sentinels, the lovely valley of St. Charles, were already crowned with the early-falling snows of Canada; and the Isle of Orleans gleamed, in the distance, like some brilliant gem on the bosom of the broad St. Lawrence.

Opposite the frowning hight, bristling with cannon, lay the precipitous shores of Point Levi, rising abruptly from the noble bay of Quebec, and terminating in a wooded promontory. Here and there, perched like an eagle's eyrie, on its craggy ledges, appeared the white-washed walls of the peasant's cottage gleaming through the foliage; while its swelling hills, and the undulating surface of its many-colored woods resting against the vivid background of the sky, gave to that point of land a picturesqueness of effect far surpassing that of the most finished productions of art.

But not to the eye alone did this ministry of beauty make its appeal: the air was full of harmonies—the whispering of leaves, the vesper-songs of birds, the humming of the insect tribes, and of odors, wafted from every woody dingle where the wild-flowers still brightened the fading earth with their beauty, while, mingled with these fainter perfumes, came the rich fragrance of exotics from the stately gardens of the castle, in whose gay parterres still lingered the rarer flowers of European climes—the rose of Provence, the "Frenchman's darling" mignonette, and the balmy violets of England.

But if the heavens above were glorious in their calm beauty, and the earth beneath peacefully radiant as a poet's dream, there were sounds abroad, marring with their dissonance the harmonies of nature. The tramp of soldiers, the rattling of arms, the hurrying to and fro of excited men jarred harshly on the silence of the night; while over all this was cast the spell of music from the military band, which played before the castle of St. Louis the national airs of France.

But the group of officers who in the deepening twilight, still remained standing on the summit of the citadel, looked not now with admiring eyes upon the scene. Danger menaced them even in their stronghold; nay, they gazed upon its very presence; and in the whole glowing landscape they saw but one object of interest—a hostile fleet, far from contemptible in force, lying in their own majestic river, under the walls of their city, its white canvass bellying in the breeze and the ensign of England streaming from the mast-head of the admiral's vessel.

The expedition had been fitted out by the British colonists of Massachusetts, and intrusted to the command of Sir William Phipps, a man whom humble birth had not prevented from rising to the highest posts of power and honor, and whose talents and virtues had won the favor and confidence of his sovereign.

Previous to the appearance of the gallant little armament before the walls of Quebec, it had almost without opposition, captured several French posts on the shores of Newfoundland and the lower St. Lawrence, and had actually arrived at Taloussac, on the Saguenay, before any tidings of the impending danger reached the Canadian capital. Rumors, it is true, were rife concerning its approach; and parties of observation had been sent out by its vigilant governor, Comte de Frontenac, and canoes despatched to seek for some ships laden with supplies, which were daily expected from France—their safe arrival in the event of a siege, being all-important to the garrison.

Defensive preparations had also been made, and were still going on, by order of M. de Frontenac, with unrelaxed vigor; for, although strong in natural defences, there was still need to strengthen its rocky bulwarks against insidious assault, and to defend by artificial barriers, those weak points which, in the lower parts of the city, were accessible from the river. But the lofty crest of Cape Diamond was not at that time crowned with works of solid masonry, although the present structure had even then been commenced, and from its northern angle there expanded an irregular line of bastions, crossing the promontory to the banks of the St. Charles.

The citadel, at that period, was a quadrangular fort, with flanking defences at each corner, protected by a wall on the inner side; while some rude field-works, with redoubts, strengthened the front towards the Plains of Abraham. The lower town, too, had its battery; and the narrow precipitous passages ascending from it to the upper part of the city, were protected by loop-holed walls, intrenchments, and rows of *chevaux-de-frise*.

Speculating upon the audacity which brought this British armament before the walls of their city, the knot of officers we have mentioned remained upon the hight till only the white shrouds and gleaming lights of the hostile vessels were discernible through the gathering darkness; and then one after another departed till only two remained, leaning against the broad flag-staff, and gazing down upon the illuminated windows of the castle. Suddenly a rich strain of music swelled upward from the balcony, when turning to his companion, the elder of the two young men said, with a gay smile:

"Light and music wherever *her* presence beams, Louis! Is it not so? Come, let us leave this breezy hight; and though with some of us, perchance, it may be our last night of life, it will be well to spend it where we may have a foretaste of the heaven that is to follow."

"Your light tone, Gaston, is in ill-keeping with my graver mood," answered the other with a gesture of impatience: "yet go, and bask in the radiance of her beauty; but——"

"And wherefore *but*, St. Ours?" interrupted his friend. "What means that settled gloom, that desponding tone, whenever Madame de Lavasseur is our theme?—she whom I know you love—and not in vain, if there is aught beside outward seeming in her smiles, in the conscious blush when you approach, in the tones of liquid sweetness from her lips—and such lips! Cupid be merciful! The honey of Hybla was vinegar to the dew that bathes those living roses!"

St. Ours sighed deeply, and was silent. He had not even a smile for the absurd rhapsody of his friend: in truth, he was struggling hard to subdue the emotion that well-nigh mastered him; but with all his efforts, he could not conceal it from the observation of D'Esperon, who, unable to divine the secret cause which never failed to arouse it in connection with Madame de Lavasseur's name, exclaimed with an impetuosity which formed a part of his frank and generous nature:

"In the name of all the saints, Louis St. Ours, explain to me the mystery which drives you to despair, when love and duty stand ready, amidst a score of hapless aspirants, to crown you with triumph! Montres, D'Aubigny, De Lorme—would they not barter all their hopes of fame in these northern wars, for one little token of that favor which the fair Euphrosyne showers, without stint or measure, upon you?"

"Ah, that is it, D'Esperon! If she looked upon me coldly, I could bear to suffer; but it is cruel destiny to know the treasure might be mine, were I permitted to possess it; and this it is which must explain to you the secret of that unhappiness whose manifestations have so often awakened your sympathy and wonder."

"I do not comprehend you, Louis. Why is it that the treasure won, may not be possessed?—that, in the very presence of this adored Euphrosyne, I mark your cheek grow pale, your brow become clouded, and see you steal away even from the smiles which are your life, to darkness and solitude."

"Forgive me, Gaston," said St. Ours; "I know I must have tried your patience sadly; but till the certainty was forced upon me that, unworthy as I am, I held the happiness of another in my keeping, I resolved to bury deep in my own breast a secret which is the haunting skeleton of my life. But from you I will no longer have any concealment. I have no formal history to relate, and only a few brief words to utter, but they are pregnant with fatal meaning, as you will believe when I tell you—I am married!"

"Married!" exclaimed D'Esperon in half-indignant astonishment. "Can I believe you, when no word of this has ever passed your lips?—not even to me, your comrade in arms, your brother in affection, your friend and confidant—as I thought—in every joy and sorrow, since first we knew each other, years and years ago!"

"Even so, Gaston, for I trained my thoughts never to dwell upon the odious theme. Or rather, I should say, indifferent to the ties that bound me, I scarcely realized their existence till the bright vision of Euphrosyne appeared, and awoke me to the bitter consciousness of my thraldom."

"But how and when was this fatal marriage contracted; and to whom, in the name of Heaven, are you sacrificed?"

"These, briefly, are the circumstances of the case:—My father and the Count de Lancey were bosom-friends from my boyhood, and in the ardor of their romantic attachment, they vowed to each other that, should they in after-years become parents, their first-born children, if of different sexes, should cement by marriage the union of the families. My father inherited a proud name with fallen fortunes; while the Count de Lancey, less illustrious by birth, was the possessor of immense wealth, so that the friends each derived his own advantage from the compact; and when, in the course of time, they became parents, the little girl and myself were taught, among the first lessons of our childhood, to regard each other as future husband and wife. Still, had the union been delayed till we arrived at maturity, it would perhaps have never taken place; but, unfortunately, the sudden illness of the count hastened its consummation. An injury received in the chase was pronounced fatal by his physicians; and when informed of his danger, he desired that myself and father should instantly be summoned.

We resided in a distant province, but we set out immediately on receiving the tidings, and traveled night and day. We arrived in time to see him alive, and though near his end, his faculties remained singularly clear. He expressed his satisfaction at my father's prompt compliance with his wishes, reminded him of their compact, and signified his desire to see the marriage solemnized between his daughter and myself before he breathed his last: "Otherwise," he said, "he must leave her in the power of those who would differently shape her destiny; and the dearest wish of his heart was to bestow her and her wealth, with his own hand, upon the son of his earliest and truest friend."

"It was a strange proposal, children as we both were—the girl-bride being but twelve years old, and I only three years her senior. But absorbed in grief for her father, she had no other will than his; and to me, who had always looked upon the union as a thing of course, it was a matter of perfect indifference whether it took place then and there, or was postponed for half-a-dozen years. And so we were married by the count's confessor, who was present with a lay-brother from a neighboring convent. Strangers to each other, we were united in indissoluble bonds—indifferent to the present, and regardless of the future, which by that act was rendered to one of us at least, dark and joyless for ever.

"But a secret presentiment of coming woe crept over me when I found my fate irrevocably fixed—a deep aversion to my child-wife filled my heart; but, as by the marriage stipulations, I was not to claim her till she had completed her sixteenth year, I rejoiced in the reprieve, and gave all anxious thought on the subject to the winds.

"I saw her but once after we parted at the altar, and then, in compliance with my father's wishes, I accompanied him to the convent where she was placed to complete her education. She replied to my distant greeting with averted looks, and I fancied that I inspired her with uncontrolable disgust. This conviction strengthened my repugnance to her; for, young as I was, I had a keen sense of the beautiful in woman; and when I looked at her undeveloped figure, her thin childish face, and large meaningless eyes, I passed gladly from her presence, hoping, almost resolving, never to enter it again."

"And you have never seen her since?" questioned D'Esperon.

"Never! Two years subsequently, my father died; and having entered upon a military life, I was sent upon foreign service, and remained abroad till recalled by the appointment which tranferred me to this Western world in the suite of the Comte de Frontenac."

"And your wife?" asked D'Esperon.

"I am ignorant of everything that concerns her," said St. Ours. "At various intervals, I heard that she always spoke with bitterness of her early marriage, denouncing it as the misfortune of her life; and this settled hate on her part fortified me in my resolution never to trouble her with a husband's claim, nor ever to intrude my unwelcome presence upon her. For aught I know, she may now be a veiled nun in the convent where I left her; but this is not probable. I only wish it were; and then I should be absolved from the vow I made my father on his death-bed—never voluntarily to break the tie which binds me to the daughter of his friend."

"It is indeed a forlorn hope, I fear," said D'Esperon. "Had such an event taken place, you would have heard through a hundred channels before now."

"True; it does not offer even a straw to the drowning man's grasp, and I have only to bear my doom with such patience as I can; and it would have been an easy task, this quiet submission to an iron destiny, had my heart remained untouched by another. But to long with all the ardor of passion, to know myself beloved by the most enchanting of women—Oh it is often more than manhood can endure!"

"But this child to whom you were wedded, St. Ours, has, with the lapse of years, become a woman. How know you that she has not blossomed into an angel, who would fill your whole soul with the ecstatic sense of her loveliness?"

"It could not be. You would not think so had you seen her. Beside, she is not Euphrosyne, and so could win no love of mine. Still, though I have wished to be forgotten by her—to be thought of, if remembered at all, as one dead—should she demand of me the protection of a husband, I would yield it, in fulfilment of my vow made to her, and of the promise to my father on his dying bed, never to rupture my marriage-tie. But I have little fear that she will claim from me any frigid duty, and I gladly interpret her unbroken silence into a repugnance as unconquerable as my own."

Louis drew his cloak around him as he ceased speaking, for the night air blew chill and damp from the river, and leaning against the flag-staff, remained for a few minutes lost in silent thought; then suddenly addressing his friend, he said with emotion:

"This is *her* birth-night, Gaston, and we but ill honor it by loitering here. Let us go and mingle with the crowd of her worshippers, it may be, as you say, for the last time; but the brief hours of life which, perchance, remain for some of us, I at least would wing with brightness such as her presence only can bestow."

Arm in arm, the two friends descended from the rock, and bent their steps toward the castle, from whence came the sounds of music and laughter, sickening to the aching heart of St. Ours, but exhilarating to the light spirits of his companion, who with quickened steps, pressed on, eager to share the revelry so congenial to his buoyant nature. They entered the vestibule; and D'Esperon had bounded half-way up the broad illuminated staircase, when he paused to look back for his more tardy companion, who was slowly ascending step by step, his fine face still bearing the overshadowing trace of his recent emotion.

"Courage, Louis! courage and hope Remember your family motto, and wear your heart as bravely as you do your sword," said D'Esperon, gaily.

St. Ours answered his friend's sally by a faint smile; and springing up to the landing on which he stood, they passed on together to the grand saloon, crowded, on this the birth-night of the governor's favorite niece, the Madame de Lavasseur, with a brilliant assemblage of the most distinguished residents, civil and military, of the place.

M. de Frontenac would not permit the threatening aspect of public affairs to interfere with the arrangements made for the occasion; and the festivities at the castle presented a scene of magnificence which would have been in better keeping with an era of festal victory, than with one which was probably to precede the deadly encounter of enemies.

Yet who could think of impending danger, in the midst of so much gaiety, and in the presence of the night's radiant queen, the charming Euphrosyne, the cynosure of all eyes, eclipsing, by her sweet simplicity, her exquisite grace, and a beauty more touching even than it was dazzling, the showy women who, in the imposing splendor of rich robes and jewels of countless value, lent *eclat* to the scene! She moved among the glittering throng, beautiful in her unadorned simplicity, a few natural flowers wreathed among the rich folds of her shining hair, and arrayed in robes of the purest white; for her weeds, if she had ever worn them for a husband who possessed not her affections, were long ago cast aside; and on this her twentieth birth-night, she resembled rather a youthful bride than a widow.

With a calm step but a throbbing heart, Louis St. Ours passed through the brilliant crowd. Not daring by one furtive glance to single out the object who filled his every thought, he made his way to the upper end of the saloon, where, surrounded by a group of officers, M. de Frontenac stood discussing the great topic of interest—the arrival of the hostile fleet in their waters.

St. Ours was becoming an attentive auditor to the circle, when, by a sudden evolution of the dancers, he caught a glimpse of Euphrosyne; then her sweet silver laugh rung upon his ear; and forgetting all things else in the thought of her, he drank eagerly in the low musical tones of her voice, as they came to him mingled with the general hum, yet separated to his ear from all other sounds, her lightest tone penetrating like some divine harmony into the secret recesses of his soul.

She was dancing with the young Baron D'Aubigny, an officer of the governor's household; and she moved with an airy grace that scarcely suffered her buoyant step to touch the floor; while, in the pauses of the figure, she conversed gaily with her partner, her animated face upturned to his with a beaming look that made St. Ours start.

Was it possible, he asked himself, that the tender devotion so long manifested towards her by the baron, was at last awaking an answering feeling in her heart, and could it be this subtle magic which lightened even her marvelous beauty, and lent to every gesture a diviner grace? At this surmise, admitted only for an instant, a jealous pang wrung his heart; but another stolen glance reassured him, for he met an answering look from her sweet eyes—a look which he knew never came but from the heart.

To some she might have seemed absorbed in the tender tale her handsome partner was whispering in her ear; but Louis better understood her, and knew that for him alone her lip was wreathed with smiles, and the light of love danced in her eyes. He could not resist her fascination, nay, he did not strive to do so, and he advanced a step, as if to approach her. She marked the gesture, and instantly her whole face became radiant with pleasurable emotion. His heart bounded with passionate joy at the sight; and repelling the cruel thought that she never could be his, he murmured to himself: "For this night, at least, which perhaps may be my last, I will bask in the sunshine of her smiles;" and the next moment saw him standing flushed with happiness at her side.

The young baron drew back, mortified and offended, at the approach of St. Ours, assured, by the smile of tender welcome with which the fair Euphrosyne greeted his approach, that he saw in him the rival destined to snatch away the treasure he coveted. But, unheeding his chagrin, the lovers, rapt in their dream of bliss, wandered away towards the open balcony, over which hung the cloudless moon, and where they found the silence which their spirits craved.

High in air hung the lofty terrace where they stood, overlooking that part of the city called the lower town, its narrow precipitous streets winding down hundreds of feet below the stately castle of St. Louis. It was October, but the weather was soft and balmy as a night in June; and the rossignol, the Canadian nightingale, at intervals broke forth into song from amid the thickets of lilac and acacia where he sat con-

cealed. The vault of heaven was brilliant with its countless stars, among which shone the young moon's crescent; but their glory was eclipsed by the coruscations of the mystical aurora, often so resplendent in the autumnal nights of northern latitudes.

St. Ours, with his fair companion, stood leaning against the massive stone-work that guarded the balcony, watching in silent admiration the splendid aurora—now darting its luminous arrows far up the heavens, now broadening and reddening into sheets of flame, that waved to and fro like blood-red banners—and again, paling to a silver radiance, as innumerable shafts of light, diverging from the horizon, streamed up to the very zenith, and there uniting, formed a vast curtain of inconceivable splendor, which seemed to inclose the hemisphere.

Attracted by the report of the brilliant phenomenon, many of the guests had gathered on the balcony to witness it; but behind the screen of a stone abutment, the lovers remained unobserved—communing in spirit, though their lips were silent. Suddenly the strange brightness grew more intense; the grand tent shook out its luminous folds, waving and shimmering till the heavens were one canopy of light, beneath whose radiance every feature of the landscape became distinctly visible—the rocky summits of Cape Diamond—the wooden promontory of Point Levi—the fair valley of St. Charles, with its guardian barrier of mountains—the little village of Beauport, and near its shores the dark ships of the invaders, lying motionless at their anchorage. Their tall masts, and the delicate tracery of their slender spars, were clearly defined against the glowing sky; and as St. Ours pointed them out to Euphrosyne, he felt a slight shudder pass through her frame, and he could scarcely catch her tremulous whisper as she murmured: "It is a fearful sight that hostile armament, which to-morrow—ah! to-morrow!"—— The concluding accents were inaudible, for she bent over the low balustrade to hide her emotion.

The heart of St. Ours throbbed wildly, nay, rapturously; he knew for whose safety she most feared, and the certainty that he was beloved, brought with it a dangerous delight. Yet the experience of each day's intercourse with her had taught him to wear an enforced calmness, which now sustained him as he answered her half-uttered fears with a few quiet words. At variance were his tones with the tumult of his feelings, but he dared not abandon himself to their control.

"There is, I think, little to fear from yonder invaders, who, in full view of our impregnable fortress, will scarcely venture an attack. But even should they be so foolhardy, and some of us, as it must be, fall in the service of our king, would there not be consolation fair Euphrosyne, in that saying of the ancients, which you yesterday repeated to me—'Whom the gods love die early?'"

She attempted no reply, but still bent in silence over the balcony, hiding her face in the flowers she held. He saw them tremble in her light grasp, and saw, too, glittering on their fragrant leaves, the precious tears which fell from her downcast eyes. How difficult he found it then to crush down the aching secret of his heart!—it trembled on his lips as, drawing her closer to his side, he repeated in loving and passionate accents her cherished name.

But only for an instant slept the cruel remembrance of this thraldom; and checking the rash confession he was almost in the act of pouring forth, he moved a few steps from her, and bowing his head upon his breast, strove to still the rebellious murmurs of his heart. She drew towards him, and, as though she understood the cause of his disturbance, laid her hand on his arm with that sweet familiarity which had of late grown up between them, and said in her sweet winning tone, and with a look of bewitching tenderness: "Louis, you are unhappy; and will you not suffer me, your friend—your sister—to be your comforter?"

"Sister!" he repeated with a sudden start. "Ah! Euphrosnye, could I tell you all!—but not to-night. Let me at least enjoy these fleeting hours, for we know not what the morrow may have in store for us."

An expression of pain crossed her face, but she answered him with cheerful tones and sweet chidings for the indulgence of his morbid fancies.

"Ah, sweetest Euphrosyne, chide me as you will," he said: "I deserve your harshest rebuke for casting one shadow from my own darkened life over the joyous sunshine of yours; by daring, with the web of an evil destiny around me, to lavish my love and my despair where I can neither ask nor hope for aught in return."

Transported by the fervor of his passion, St. Ours gave rapid utterance to these words—such words of tender meaning as he had never before spoken to the object of his hopeless love. Euphrosyne heard them with a thrill of joy which spoke eloquently in the glad light of her bashful eyes, as she raised them with a glance of soft reproach to his face, instantly to cast them down again, shrinking from his fervent regards. But when he read in that tender look the full and perfect love which her heart accorded him, he felt deeply the untruthfulness of his conduct in permitting the silent growth of her affection without striving to check it, by revealing to her his true position. Self-condemned and wretched, he stood before her, inwardly resolving, though it should for ever terminate their intercourse, to embrace the earliest opportunity of making known to her all the unhappy circumstances which placed an insurmountable barrier between them.

Euphrosyne, with the instinct of love, marked the deepening gloom of his manner; but she felt that she was dear to him, and the deep joy of her heart remained unchilled; her eyes met his with undimmed tenderness, and no shadow darkened the sunshine of her smiles. Louis marveled at her serenity; his own soul was in tumult, and he felt pursuaded that his sufferings could not escape her notice. Why, then, did she manifest no distrust, no disturbance? It was inexplicable to him, and almost was he tempted to believe that she valued his affections only as a triumph to her vanity; but a glance at her pure and innocent face dispelled the unworthy thought. She loved him with the fond undoubting trust of woman; and he, wretch that he was, had won her young and guileless heart, only to betray it to certain misery and despair. It was too much to bear; and to escape from it he could at that moment have been content to know that, in the coming strife, some leaden messenger of death would forever still the throbbings of his aching heart.—[Conclusion next week.

SOME THOUGHTS SUGGESTED BY GEORGE MACDONALD'S STORIES.

E. F. M.

This charming writer has a great audience, for not only thoughtful men and women read his works, attracted by his strong, earnest views of life and its duties, but the young delight in his lovely stories. And surely our truest, wisest, most loving books should be for the young, who are in that stage of growth, when every impression helps to form and color the after life. How necessary then is it that their desires should be guided towards the best things, and that their ideals of character should be pure and high! A writer says, "If the old are thoughtful, *their* warfare is almost ended; but for the young—to be thoughtless with all life before them—with so many other lives to be influenced by them for misery or joy!" So Macdonald in his "*Vicar's Daughter*," "*Ranald Bannerman's Boyhood*," would teach his readers to be nobly thoughtful, and in all their gladness to grow towards goodness also. And we know how often

> "Truth in closest words shall fail,
> When Truth embodied in a tale
> Shall enter in at open doors."

Macdonald is full of human sympathy for every life, however low and narrow it seems, and when there is everything to discourage us, and our labor seems in vain, and our patience is sorely tried, he calls to our remembrance the disciples in the garden, and the one hour they should have watched with the Saviour. He beautifully speaks of the perfect unfolding of that Divine Life in the midst of weariness, doubt and ingratitude, like the patient opening of the perfect blossom on dark and muddy waters. Christ's example of forbearance and of His ministry is set for us in our intercourse with one another.

He is continuously trying to bring to our dull perception, the love of God, as the Father, Saviour and Friend of each one of us. "He calleth his own sheep by name." "He goeth before them and the sheep follow Him." There is no description of our Lord which more fully tells His special Providence, His love and care for each individual one of us, than this of the Good Shepherd. He calls us *by name*,—no seeming accident, no trifling detail, no earthly care, is forgotten by Him. Our Father "*knoweth that ye have need of all these things*," said our Saviour, speaking of food and drink and clothes. Because His eyes behold eternity, He sees all the more clearly what to-day's troubles, this moment's joy or disappointment mean; and whatever comes to us we may be sure it is sent by a Father, who will make all things work for our good at last.

Our lives, our stories, mean many deep and beautiful things. Providence is continually unfolding our higher nature, if we will accept its guidance, weaving its grand and loving thoughts through the loom of time into the warp and woof of our character. God is with us as a quickening life, and if we would obediently hear His teachings no bird would fly by our window, or lily bud open, without something for us,—no, nor would you ever meet a friend or an acquaintance without giving or receiving some good. For little things keep alive the mental light and freshness in the atmosphere of our souls, or depress and deaden them. We all know how strong the influence of the invisible air is, though we may not think of it as the cause of our bright moods and dreary ones, but all feel it. "*The wind is in the East*," as Mr. Jarndyce said.

Macdonald says, "The east wind has a shadow-wind along with it, which blows in the minds of men." This writer has a quick and glad insight into the meanings of things about him. In one of his stories he speaks of a garden, fresh with dew and blooming with flowers, as "a lovely type of a Commonwealth, indeed, of the kingdom and garden of God." Even the shadows move him to tenderly beautiful thoughts. He says, "See how Nature has her own way in this crowded street! Not all the hurry and roar and confusion can keep the shadows out. Look: wherever the space is for a moment vacant, there falls a shadow as grotesque, as strange, as full of unutterable things as any shadows on a field of grass and daisies," and again, "the shadows look as if thrown from another world here, like angels from the lovely West and purer air" where the sunset still lingers.

We all know how little things comfort and cheer us sometimes when we are in the greatest trouble; how, when the heart seems to have grown into only a dull, aching throbbing, and the brain to have become so overstrained and weary that it will no longer bear weight, God sends some little thing, a few flowers, a little child's soft, sweet voice, a few notes of music, and we feel a strange relief, and hope springs up once more like a fountain of fresh waters. In one of Macdonald's books, "*Robert Falconer*," is in sore trouble, far away from home. Lying awake at night, he heard a flock of sheep passing under the windows of his room. "A faint, musical rain invaded his hearing; but the night was clear and the moon shining. The sound came nearer, and revealed itself a delicate tinkling of bells. It drew nearer still, and nearer, growing in sweet fullness as it came, until at length a slow torrent of tinklings went past. It was a flow of a thousand little currents of sound, a gliding of silvery threads, like the talking of water-ripples against the side of a barge in a slow canal, all as soft as the moonlight, as exquisite as an odor." No wonder the bruised heart felt quieted, and at rest, for with the passing of the flock might come the blended promises from Him who keepeth Israel like a flock, who *leadeth* his sheep into green pastures."

RECENT LITERATURE.

Sensible Etiquette of the Best Society.—Customs, Manners, Morals and House Culture. Compiled from the Best Authorities. By Mrs. H. O. WARD. Philadelphia: Porter & Coates.

THERE are those who scout at the idea of formulated rules for governing the conduct of affairs in social life. This class insist that a kind heart will dictate what is proper and expedient under any circumstances, and that it is a safer guide than the artificial customs established by frivolous society.

Tennyson's estimate of the value of a kind heart is undoubtedly a just one, but even admitting all that he says in praise of it, did ever the most amiable of kind hearts give one an inkling as to whether it is preferable to cut bread or to break it? to lay the napkin on the lap, or tuck it under the chin?

These matters may appear trivial, but it should be borne in mind that life is made up of details, and to know for a certainty just how and when to perform the thousand and one acts which are required of all who mingle in any society, however humble, will save one much pain and humiliation.

The book under notice is simply admirable. The author has consulted a wide range of authorities, and nothing in social life has been deemed of too little moment for her to notice. Whether it be calls, correspondence, cards, receptions, weddings, dress, salutations, kettle-drums, dinners, home education, chaperons, or any of the other topics which have any bearing on conduct, each and all are freely and intelligently treated. The strong, pure morality of the book should commend it to the careful attention of parents and educators, and although we think the author too conservative in her ideas of woman's mission, still she errs on the right side; and in these days when our youth are gravitating toward what is fast in behavior, and loud in dress, we gladly welcome this excellent work and trust that its influence may be felt in thousands of families.

A few extracts are given below:

When a letter is upon business, commencing "Sir" or "Dear Sir," it is customary to place the name of the person addressed at the close, in the left-hand corner.

When written in the third person the name is omitted of course; also in all letters commencing with the name of the person to whom you are writing, as "My dear Mrs. Jones." The name should *not* then be repeated in the left-hand corner as when one commences, "Dear Madam," or "Sir." It is astonishing to see how often this rule is violated by persons professing the greatest punctiliousness in observing the correct forms and ceremonies of social intercourse.

The custom of leaving a blank margin on the left-hand side of each page is now looked upon as obsolete, excepting in legal documents. No notes should be commenced very high or very low on the page, but should be nearer the top than the middle of the sheet.

In addressing a clergyman it is customary to commence "Reverend Sir" or "Dear Sir." It is no longer customary to write "B.A." or "M.A." after his name. "Rev. Henry Bell," is the correct form; where the first name is not known, "Rev. —— Bell."

Doctors of divinity and of medicine are thus distinguished: "To the Rev. James Haw, D.D.," or "Rev. Dr. Haw;" "To J. Latham, Esq., M.D.," "Doctor Latham," or "Dr. Latham."

Foreign ministers are addressed as "His Excellency" and "Honorable."

In writing to servants it is customary to begin thus: "To Ellen Weller: Mrs. Jones wishes to have her house in readiness on the 14th inst.," etc., etc. To trades-people the third person is used. If necessary to write in the first person, one commences, "Sir," and signs "Yours truly," giving the initials, as "J. E. Jones," not "Julia E. Jones."

There is a diversity of opinion as to the degrees of formality in commencing and signing notes and letters. Both in England and New England the scale is as follows: "Madam," "Dear Madam," "My dear Madam;" "Dear Mrs. Jones," "My dear Mrs. Jones," "My dear Friend." In closing a note the degrees are implied as follows: "Truly yours" or "Yours truly;" "Very truly yours," "Sincerely yours," "Cordially yours," "Faithfully yours," "Affectionately yours."

There are words enough in use to express every grade of feeling, and they should be carefully selected for the purpose; as the conclusion of a letter or a note makes an impression upon the person reading it. To aged persons "With great respect, yours sincerely," recommends itself as being less familiar than the other forms. A very rude ending is "Yours, etc."

* * * * * * *

It is everywhere looked upon as a vulgarity when a married lady signs herself with a "Mrs." before her name, or a single lady with the "Miss." In writing to strangers who do not know whether to address you as "Mrs." or "Miss," the address should be given in full, *after signing your letter*; as, "Mrs. John Vaughan," followed by the direction: or, if unmarried, the "Miss" should be placed in brackets, at a short distance preceding the signature.

Never write of your children as "Miss Nellie" or "Master Edward." Reserve the "Miss" or "Master" for use in speaking or writing to inferiors.

* * * * * * *

The expression "presents compliments" has been discarded for quite a number of years by all who are not admirers of the old-school forms and ceremonies. It is as obsolete as the word "genteel;" or as the word "polite," which was formerly so much used by Americans in their acceptances and regrets, the English form of "kind" or "very kind," being now generally substituted for "polite."

"I can give you no reason," says an English writer, "why these poor words 'polite,' 'present compliments,' and 'genteel,' are thought so vulgar; but it is quite certain that they mark the class to which you belong. They are tabooed or excluded in good society."

* * * * * * *

Among the most trustworthy tests of good home training is placed that of table manners; and no individual can hope to acquire and to keep them who knows any difference in them in the privacy of the family circle, and when in company. The properly-trained youth does not annoy those next to whom he sits by fidgeting in his chair, moving his feet, playing with his bread, or with any of the table equipage. Neither does he chew his food with his mouth open, talk with it in his mouth, or make any of those noises in eating which are the characteristics of vulgarity. His food is not conveyed in too large or too small portions to his mouth; he neither holds his head as erect as if he had swallowed a ramrod, nor does he bury his face in his plate. He handles his knife and fork properly, and not "overhand," as a clown would; he removes them from the plate, as soon as it is placed before him, and he crosses them side by side when he has finished, and not before, as this is the signal which a well-drilled butler observes for removing the plate. He does not leave his coffee-spoon or tea-spoon in his cup. He avoids using his handkerchief unnecessarily, or disgusting those who are eating by trumpet-like performances with it. He does not converse in a loud tone, nor indulge in uproarious laughter. If he breaks an article he is not profuse in his apologies, but shows his regret in his face and in his manner rather than in words. Some writer has said: "As it is ill-mannered to express too much regret, so it is the essence of rudeness not to make any apology." Tittlebat Titmouse, when he broke a glass dish, assured his hostess that he would replace it with the best in London. This was rather too practical a form of showing his sincerity.

The well-bred youth breaks his bread instead of cutting it, taking care not to crumble it in a slovenly way; he takes his wine holding his glass by the stem, and never drains it. He does not take wine that he does not want, because he is too timid to refuse, nor does he hesitate to pass any course of which he does not wish to partake, instead of playing with it as a writer on table-etiquette advises. He swallows his food before he leaves the table, and sees no occasion for astonishment because eating in the street is forbidden. All the details of good breeding are as familiar to him as his alphabet, and he has been taught to think that attention to details in all things is the true sign of a great mind, and that he who can, in necessity, consider the smallest, can also compass the largest subjects.

* * * * * * *

The foregoing are not to be taken as a fair index of what the book contains. It is almost an injustice to quote from it, for to properly appreciate how valuable a book it is, one should read it entire.

The American Antiquarian. A Journal of Anthropology, devoted especially to Early History, Ethnology and Archæology; Illustrated. Published quarterly by Brooks & Schinkel, Cleveland, O. Edited by Rev. Stephen D. Peet, Ashtabula, O. $2 per year.

THE scope of this magazine will be understood by the following list of topics:

The Early History, Exploration, Discoveries and Settlement of the different portions of the Continent.

The Native Races, their Physical and Mental Traits, Social Organization and Tribal Distinctions; their Religious Customs, Beliefs and Traditions, as well as their earlier and later Migrations and changes.

The Antiquities of America, especially the Prehistoric Relics and Remains Ancient Earth-works and Structures, Inscriptions, Hieroglyphics, Signs and Symbols.

Prehistoric Man, his Origin, Antiquity, Geological Position and Physical Structure.

The magazine will also treat of subjects of a more general character, such as The Origin of Man, the Rise of Society, the Origin of Writing, the Growth of Language, the History of Architecture, the Evolution of Ornament, and Ceremonial Observances, Comparative Religions, Serpent Worship and Religious Symbols, Man and the Mastodon, Man and Animals, Earth and Man, and many other topics which are connected with the Science of Anthropology, especially as they are viewed by the Antiquarian.

The articles are of a popular cast, though as a Scientific Journal, the aim will be to record all New Discoveries and Explorations, to notice the proceedings of the various scientific associations, and the latest publications; and to give the results of the latest investigations in each department.

The Contributors are gentlemen who stand high in the scientific world and who are thoroughly acquainted with their specialties.

The correspondents are also very intelligent men, residing in various localities on this Continent and in different parts of Europe. The design is to make the magazine partake of the advanced studies of the best scholars on the Continent. It will be a thoroughly reliable and valuable Scientific Journal.

HOME AND FARM, the clever semi-monthly published by B. F. Avery & Sons, Louisville, Ky., steadily improves in matter and appearance. It is unnecessary to wish it a success. It has already attained it. Its circulation is the largest of any journal published south of the Ohio. While devoting its columns mainly to the interests of the farm, it does not by any means neglect the family.

BRIC-A-BRAC.

HAMLET TO THE PLAYERS.

Speak the speech, I pray you,
As I pronounced it to you, trippingly on the tongue;
But if you mouth it, as many of our players do,
I had as lief Count Joannes had spoke my lines.
Nor do not saw the air too much
With your hands and feet,
After the fashion of a wind-mill, or Brother Talmadge,
But use all gently. Oh, it offends me to the soul
To see a robustious, periwig-pated fellow
Tear a passion to tatters, to very rags,
And mop the stage with it, so to speak.
Be not too tame, either,
But let discretion be your tutor,
As it is much cheaper than to take lessons
Of a professor of elocution.
Suit the action to the word, and *vice versa*,
And get your work in in some kind of style.
Anything overdone is from the purpose of playing,
Whose end is to hold, as 'twere, the mirror
Up to nature, that for herself she may see
How her clothes fit, and ascertain
If there is any powder in her ears or eyebrows.
A speech overdone, or come tardily off,
Though it make the gods in the cock-loft laugh,
Can not but make those in the parquette
Or dress circle grieve, the censure
Of one of whom must, in your allowance,
O'erweigh a whole theater of others,
For they pay from $1 to $1.50 each.
O there be players that I have seen play,
Not to speak it profanely,
That, neither having the accent of Christians,
Nor the gait of Christian, Pagan or man,
Have so strutted and bellowed—
And I do not by any means
Refer exclusively to Dr. Landis—
That I have been tempted to go out to the box-office,
Murder the treasurer, recover my money,
And set fire to the building. *Oil City Derrick.*

GOOD COMPLEXIONS.

In writing of Madame Rachel and her victims, the London Medical Examiner takes occasion to point out the silliness of those women who think that there is any artificial method of preserving the beauty of the complexion by enamelling and such like processes. It says that the complexion is dependent on the quality and quantity of the blood in the skin, and the condition of the cells of the skin through which the blood is seen. The way to ensure having a proper quantity of healthy blood in the skin is to rise early, to be much in the open air, especially during the hours of sunlight, to avoid over-heated, artificially lighted, unventilated rooms, and to retire early to rest. To keep the cells which protect the skin in a natural state, all that is necessary is to wash the surface of the body with soap and water only, or, in the case of some delicate skins, which the alkali of most soaps irritates, with water alone. Whoever will attend to these directions will do all that can be done to preserve, as all ought to try and preserve, their skin in the most healthy and, therefore, beautiful condition.

THE BEE KEEPER'S ASSOCIATION.

Come where the clover is kissed by the sun;
Come where the honey-bees drowsily hum;
Come where the bumble-bee, happy old thing,
Brings up the boys with a sting-a-ling ting!

Precious old bumble-bee, bird of my youth,
Sharper thy tail than the arrows of truth;
How oft, when the school-boy steps into your realm,
You knock him stone-blind with a touch of your helm.

How oft when the picnicing children of men
Sit down at the door of your grass-covered den,
You will kick a big man 'cross a ten-acre lot
By the lift of your foot when it's heated red-hot.

Far worse than the candidate's buzzing to me
Was the petulant buzz of a boy-hating bee:
Appalling to men and to gods was the sight
When a barefooted boy got a bumble-bee bite.

Bee of the bumble, like memory's chimes,
The notes of your bagpipe call up the old times;
And still boyish hearts, light as birds on the wing,
Will howl when you tinkle its sting-a-ling ting.
—*Hawkeye.*

PAPER BOTTOMS FOR IRON SHIPS.

After getting used to paper car-wheels, we need not be surprised to learn that a new coating for the bottoms of iron ships consists of brown paper attached by a suitable cement. It is the invention of Captain F. Warren, of England, and the substance he proposes to use is a preparation of *papier-mache*. It is stated that weeds and barnacles will not adhere to paper, and that the special cement by which the paper is secured may be applied cold, but it hardens under water, is unaffected by comparatively high temperature, and possesses great tenacity. A plate thus protected on one side has been immersed for six months, with the result that the protected side was found clean, while the unprotected metal was covered with rust and shellfish.

LITTLE JOHNNIE'S "PIECE" ON OWLS.

Wen you come to see 'em close they got ortle big eyes, but wen you feel 'em with yur fingers, which thay bites, you find thay have only got jest enuf meat to hold there fethers together. Once there was a man thot he would like a owl for a pet, so he tole the bird man to send him the best one in the shop; but when it was brot home he look at it and skoweezed it, but it didn't suit. So the man he rote a letter to the bird man, and said: "Dear sir: I take my pen in hand to inform you I'll keep the owl wich you have sent, tho it ain't like I wanted, but wen it is ded you must make me a other, with little eyes, cos I spose these is bout No. 12's, but if I pay you the same for No. 6's mebby you can afford to put in more owl."

"Hail, gentle Spring! etherial mildness, hail!"
Thus quoth the poet, and his prayer prevailed,
For scarcely had he tuned his lyre to sing
Before the weather altered, and it hailed.

Favorite song of the baker—"I knoad thee every hour."

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

THE SOFT, WHITE HAND.

I've seen them sitting side by side—
A lady fair, of gentle mien,
And he in strength of manly pride—
In many a gay and glittering scene.

And sometimes, when from harp and band
Do thrilling floods of music stream,
I've seen her little, soft, white hand
A moment on his shoulder gleam.

And oft, at home, when passing by,
As he reclines in his arm-chair,
I've seen her little, soft hand lie
Unheeded on his shining hair.

But oftenest, when they're alone—
For hearts like hers are pure and shy—
Her little, soft hand seeks his own,
Alas! unnoticed there to lie.

He loves her! Yes; but love of man
"Is of his life a thing apart";
He cannot, as a woman can,
Enshrine an idol in his heart.

Love is, with him, a pleasant hour
Snatched from the ardor of the day;
Enjoyed as perfume of a flower,
And then as lightly cast away.

He dreams not of the longing there,
In her much-loving, trusting breast,
That makes her life one yearning prayer,
So mutely, touchingly expressed.

A prayer that, if he love her yet
With that sweet love of early years,
In mercy never to forget
That hidden love makes hidden tears.

And O, it yet may come to this:
That all of earth at his command
He'd give for that one transient bliss—
The vanished touch of that soft hand!

A NEW MOVE.

Many ladies would doubtless like occasionally to express an opinion or offer a suggestion to the Rural readers if they felt assured that their communication would be welcome, and if there was a nook reserved for them. I propose to give up the three columns of this department once a month to any such letters which subscribers may send. It shall be called the Women's Club, and it will "meet" the first week in every month. All lady subscribers may consider themselves members. The object of the club is the interchange of opinions and the discussion of any and all topics likely to interest women, and if the ladies will do what they can, "the club" can be made most useful. For example, Mrs. A. possibly has discovered an expeditious way of doing many little household tasks which younger or less enterprising housekeepers would be glad to learn. Mrs. B. may know the newest stitch in embroidery, another may have evolved a new style of undergarment, a third, an extensive and discriminating reader may be able to give some valuable hints on what and how to read; again a lady would perhaps like to exchange patterns of fancy articles or clothes for flower seeds or books, or —— a dozen other things, and in so large a family as the Rural there will be some who will be glad to respond to such requests. The first meeting of the club will come off in Rural of 7th September, and I shall hope for a goodly representation of members.

All letters intended for the club should be addressed "Women's Club, care Rural New-Yorker, New York." If any readers do not fully understand the aims and proposed workings of the club, I shall be very happy to reply to any inquiries on the subject. Faith Ripley.

SHOES AND SLIPPERS.

French heels are necessary to a fashionable pair of boots, and are seen upon the majority of them, and it is difficult to find ready-made, a pair of English walking boots—those with low heels and broad soles.

French kid, usually so popular, gives way this season to fancy-cloth tops or patent-leather vamps. This is the result of the popular style of cloth dress goods, and the prevailing caprice of customers for matching in all their accessories from the parasol to the boots. All shades of cloth are employed, such as very dark blue, brown, plum, green, the new deep claret or wine shade, and all the gradations of gray, and the recently introduced *beige* and *Havanne* colors. In mixed cloth there are the small-checked English effects, and the black-and-white shepherd's-plaid or check. The latter, and black alone are very popular for general use, with any costume; but the other shades go to match certain costumes of the same colors. Frequently a lady is obliged to take to her boot-maker some of her costume cloth, which roll may be of a peculiar shade and not in stock, and have her boots made to order.

A change in the buttoned boots is being attempted. It consists in making the closing straight down from the top, instead of curving it down to the front of the instep, as usual. This method preserves a pretty, unbroken outline over the instep, and the buttons are not as apt to press into the foot.

In slippers, a few changes may be noted. The large rosette has been replaced by three or four bows of narrow velvet, each bow held to an elastic strap by a buckle of steel, and each strap crossing the instep from side to side of the slipper. These slippers are very low cut at the toe, and high and pointed at the heel, and are kid-lined. When but one bow is used, it is square in effect, small in size, and confined by a larger buckle than those used on the strap-bows.

Another kind, lined with fancy kid, is sloped from the vamp and quarter to the side of the sole at the instep, and at the junction of the two a sandal strap of kid crosses the instep. They have a quaint, antique effect that is very pretty, but are suitable only for chamber wear. Others or the same use have red or blue morocco vamps ornamented with pricked patterns or applique of other colors, or of undressed calf or kid skin.

Low shoes are mostly buttoned, and are either all kid, or cloth and kid, or patent-leather. A few have ties, but these are not considered as stylish as those having four buttons. Like high shoes, they are principally made with round or box toes and have French heels.

Fancy high and low shoes have sandal straps across the ankle and foot, and button through the ends of the straps at one side. They are suitable only for the house, and to be effective, require to be worn over gay stockings.

Children's shoes are the same as they have been for a number of years, and are made with an extremely low heel or else a spring heel. Kid and morocco in black, bronze, buff, blue, white and pink comprise the assortment. Slippers are not as much worn by children as formerly, but those seen, have the ankle strap extending from the back of the heel.

For good, honest service for children as well as adults, dealers recommend straight-grained or pebbled goat shoes, and as the reputation of this material stands a practical test, there can be no doubt of its superior durability. French kid, however, has established itself as the popular leather for fine shoes, and will, undoubtedly, continue to hold its place as long as shoes are made, though now and then the tide of favor may be, as at present, disturbed by a temporary acceptance of another material.

ITEMS FOR CORRESPONDENTS.

BY THE EDITOR.

L. H. K., Bridgeport, Conn.—You do not state how your dress is made now and I can hardly tell how it would be best to remodel it. I will, however, describe a few of the latest styles suitable for your material, and you can perhaps get a hint which may help you.

Make skirt with a front gore, two gores at each side and a back-breadth, all of which, extend only to the knee. To them is sewed a plaiting that forms the remainder of the skirt. The upper portion of the skirt may be made of Silesia or cambric. The plaiting may be of cashmere or of silk. It is well in most cases to fasten the plaits underneath with a tape, so as to stay their folds. The front of the overskirt is a wide apron fitted to the belt by darts. The back-breadth is a long, straight piece, the edges of which are turned back, forming *revers* which may be faced with silk. The basque, completing the costume, is buttoned at the back. The side-backs are of silk, and corresponding side-fronts are similated with silk facings. The sleeves are coat shape and are furnished, at the wrists, with tiny silk cuffs in *revers* shape.

Another costume, which promises to be extremely popular, is known as the Princess Toilette. The polonaise to this costume is made of plain cashmere and silk, and buttons the whole length of the back, which is fitted by side-backs and side-back gores. The central portions are of cashmere, the side-backs of silk, and the remainder of the garment of cashmere. This style of combination is now *en regle*, and is adapted to all sorts of material—from the richest to the least expensive—unless a vest is used at the front, in which event the back is left plain. The front is plainly fitted by two bust darts at each side of the center, which is cut on a fold of the goods.

No decoration is required upon this polonaise, but trimming may be added if desired. The sleeves are close, and may have deep cuff-facings of silk. The skirt is made of silk and cashmere. It is six-gored, and falls just far enough upon the ground at the back to produce a graceful sweep, and may be trimmed with plaitings or flounces of silk.

In a third costume, the skirt is four-gored. The trimming at the foot is easy of accomplishment, especially if the plaits are made with a machine. Box-plaits, alternate with clusters of side-plaits. Three rows of stitching, confine the upper half of the trimming, while the lower half falls loosely. The front of the overskirt consists of a deep *tablier* smoothly fitted over the hips by short darts, and slashed up the center to a point about half-way between the belt and the lower edge. The back is merely a plain breadth, whose upper edge is closely gathered, and with the front is seamed to a belt, which fastens at the center of the back. Above the top of the slash, four upturned plaits are laid in the back edge of the *tablier*, while three downward-turning plaits are arranged in the adjacent edge of the back, after which both portions are joined in a seam a little below the lowest plait—a basque, with vest, completes this costume. The ladies costume, published in Rural of July 27, would be also suitable for your material.

Wraps still continue to be worn, and you might make one out of your dolman. Some end at the waist, others have tabs, which either hang down or are crossed and fastened with a band. They are trimmed with lace, silk, grass, *Clair de lune*, or worsted fringe beaded, plain or embroidered galloon.

If you prefer a coat, there is a walking coat with vest which would probably please you. The vest may be made of silk. It is sewed into the shoulder and under-arm seams. The coat itself has coquettish box pockets, button-trimmed, upright laps inserted into the folds of the back, a rolling collar, lapels and *mousquetaire* cuffs. This is an elegant garment. Its edges are all faced to the linings, and there is buckram stiffening in the breasts, cuffs, collar, etc., to the dainty shape. One button may close it upon the breast.

A correspondent wants to know how to make an afghan. Will some of our ladies furnish the desired information?

"BUGS" AGAIN.

Take a teaspoonful of quicksilver and beat it up with the white of an egg—it takes some little time to mix it thoroughly; apply to the bedstead and around the corners of the room, with a hair pencil or a feather; the next day there will be no bed-bugs in the room. I have used it in a log house for the last eight years and have never been troubled with bugs since I commenced using it. E. W. W.

AS YOU GO ALONG.

J. E. M'C.

"That is the first time I ever saw anyone stop in the midst of ironing to mend clothes," said Lucy. "I should not think you would get along very fast if you made a practice of it."

"That is one of my labor-saving plans," said Eunice, briskly pushing her needle back and forth through a drilled-eyed button. "In the first place, I am taking a moment's rest in this cool, sitting-room, which will refresh me, so I can work all the faster when I go to the ironing-table again. Then taking a few stitches now in these articles I have laid over a chair back to be mended, will save handling them all over a second time, and very likely having them piled up in my work-basket a day or two. You see I have everything handy in this little basket, even to a needle threaded with white and another with black thread. If a button is off, it takes but a minute to sew it on anew. If I put the articles away in the drawer, and thus have to go after them and mend them, it will add considerably to the amount of work. It will seem to add still more, for these little arrears of work are always the hardest to bring up. They are like little debts. I manage to do a good deal of work *as I go along*, that does not exactly belong to the work in hand. You may not think it very systematic, but it suits me. My system is to get my work done with as much dispatch as I can, and if it might not suit Mrs. Grundy to see me leave my wash-tub and take a basin of clean suds and wipe off a cupboard door, it does not disturb me at all. The cupboard door is clean, and it gives me pleasure every time I look towards it. That of itself is a rest, and a stimulus to help me on faster with the washing. I need not keep thinking, "there, I must wash that door when I am through with my clothes. There is nothing that succeeds like success, and every fresh success, with the housekeeper, is the foundation of a new one. Because hers is a war against dirt and disorder is no reason why she should not be fairly entitled to her laurels. I should like to have you find any enemy more persistent or more powerful. I think one who comes off victor is entitled to all the honor and glory she can get.

"There, Lucy, see how that pile of mending is reduced, and I am rested, and the irons have come up to a good heat, and I have taught you a good lesson, you will surely admit, so I am ready for work again, and feel that I have saved instead of wasted time."

HAIR-PIN RECEIVER.

LORETTA E. TURNER.

Take a square (about six inches) of silver card-board, and work it in some simple pattern—scarlet zephyr contrasts well with the silver board. Close it to form a cylinder, having first made a foundation of pasteboard, stuffed with sea-grass or some coarse stuff. Work the card-board over and over at the edge with the zephyr, where it is closed and crochet a covering for each, and in close stitch single zephyr. Then take split zephyr, crochet four stitches, turn, and in going back wrap the zephyr around the fore-finger on your left hand six times, slip it off and knit it into your stitch; crochet the four stitches in this way, then turn and crochet back *plain*. Repeat the loops, and continue in this way until you have a ruche long enough to go around one end of the receiver; then bind it off, and make another for the other end. The ruche is to be sewed on to the cover where the crochet ends meet the card-board. Finish with cord and balls. The balls are made quite expeditiously by winding over a silver fork. Then tie between the center tines, with a stout string, slip off, and trim to your satisfaction. A large ball with three tiny ones just below it, is very pretty, when one wishes to be very elaborate.

SOME SWEET-SMELLING TOILET HINTS.

Diamond Tooth Powder.—Precipitated chalk, 3 pounds; Powdered myrrh, 4 ounces; Powdered sugar, 1 pound; Powdered white castile soap, 8 ounces; Oil of wintergreen, sufficient.

Portugal Cologne.—Oil of orange peel, 3 ounces; Oil of lemon, 2 ounces; Oil of bergamot, 1 ounce; Oil of rose, 2 drops; Alcohol, 1 gallon.

Heliotrope Sachet Powder.—Powdered orris root, 1 pound; Vanilla beans, 4 ounces; Benzoin, 1 ounce; Musk, 5 grains; Civet, 15 grains; Oil of rose, 10 drops; Oil of bitter almonds, 10 drops.

Musk Sachet Powder.—Powdered orris root, 2½ pounds; Grain musk, 30 grains; Oil of rose, 30 grains.

White's Eau de Cologne.—Oil of bergamot, 1 ounce; Oil of lemon, 2 ounces; Oil of orange, 2 ounces; Oil of rosemary, 1 ounce. Oil of neroli, 2 drachms; Oil of rose geranium, 4 drachms; Oil of clove, 2 ounces; Extract of musk, 1 ounce; Orange flower water, 1 pint; Alcohol, 1 gallon.

French Lavender Water.—Alcohol, 8 gallons; Oil of lavender, 16 ounces; Oil of bergamot, 8 ounces; Oil of lemon, 4 ounces; Oil of clove, 1 ounce; Oil of rose, 1 ounce; Extract of musk, 8 ounces Extract of ambergris, 2 ounces.

The Norristown Herald insists that no man likes to hold a girl baby in his arms until she is 17 years old.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

SUMMER SIFTINGS.

ANNIE L. JACK.

"That in some season, yet to be,
Our cares will leave us time for rest."

So "we all think," but to how many of us will our first rest be in the grave! Each week we think we shall be able to enjoy more leisure when the next comes, and it, in turn, finds us as busy with fruit or pickles to attend to, visitors to entertain, or the inevitable sowing, patching, and darning. Time for rest! Not while Jim and Joe can climb the tallest trees, and tear their garments on the jagged trunks; or, as this year, when weeds grow apace, and must be hoed. But I have enjoyed a pleasant time lately in the society of congenial friends, who came to see *me* and not to criticise or enjoy my hospitality in any other way. So we talked and talked of books and flowers and days that are past, without feeling any of the restraint so often imposed by the presence of visitors. For I hold that if hospitality becomes a burden, it should at once be dispensed with, and nothing is more trying to the feelings than to enter a house where a sudden flutter and lengthened preparation tell the new-comer of the changes that are occasioned in the domestic department by his or her arrival. "A dinner of herbs" quietly and without a "fuss," is better than the "stalled ox" that is got up with great ostentation, or a table set with unusual splendor that finds the household uncomfortable and ill at ease. So we prefer the quiet, plain, method, and can now look back upon a few days of real enjoyment. What if we did simplify our meals, and make fruit take the place of pie? It saved our strength and time, and was quite as palatable. And I wonder if the readers of the RURAL know how pleasant is a little pic-nic, unpremeditated, in the woods or orchard. How sweet the food—how hungry the guests at such a time, and how happy and gay the freedom from restraint renders one! The pleasing remembrance of such days remains long and deep in the hearts of guest and hostess, and puts them both at ease and capable of enjoyment while under its influence. For life is made up of little things that fret and worry or please us and rest the heart.

DOMESTIC RECIPES.

Yeast.

I have found the following to be an excellent yeast: Grate five raw potatoes and add one pint of boiling hop-water; let scald ten minutes, then when cool add a tablespoonful of brown sugar; one tablespoonful of vinegar; one tablespoonful of salt and a teacupful of yeast or one yeast-cake. Put into a stone jar and keep where it is cool, MRS. D. SNEDEKER.

Long Island.

Snow-Cake.

Whites of ten eggs beaten very light; one and one-half tumblerful of sugar; one tumblerful of flour; one small teaspoonful of cream-of-tartar; sift the flour, sugar and cream-of-tartar together and stir gradually to the beaten eggs. Bake in a round papered pan for twenty-five minutes in a slow oven. Ten minutes after baking, frost with the white of one egg, three spoonfuls of sugar and cover with grated cocoa-nut.

Willow St., Brooklyn. MRS. W. SPELMAN.

Chow-Chow.

One peck of green tomatoes chopped fine; sprinkle one cup of salt over them and let stand over night; in the morning drain in a colander, add eight green peppers chopped fine, one cup of white sugar, cover with vinegar and boil twenty minutes. Chop fine six large onions; two bunches—the white part—of celery, with three or four red peppers. Add to the other ingredients, when cool, with a cup of mixed mustard, whatever spice you like and a pint of grated horse-radish. Put into a stone jar, cover with cold vinegar and tie down tightly.

Woodsburg. MRS. BEEKMAN.

QUERIES ANSWERED.

Parker-House Rolls.

WILL you kindly give me a recipe for the celebrated Parker-house rolls? E. L.

ANS.—To one pint of boiled milk, which has been allowed to get almost cold, add two teaspoonfuls of white sugar, one-half cup of lively home-made yeast, or a quarter of a cake of compressed yeast dissolved in two teaspoonfuls of warm water. Stir in sifted flour to make a stiff batter; cover warmly and let rise; then when light, mix in one beaten egg, a tablespoonful of sugar, one tablespoonful each of soft butter and lard, a little salt and flour to make a dough which will not stick to the hands; knead well for one-half hour, if you have the patience, return to the pan, cover tightly and let rise again; flour the board and turn the dough onto it; roll out one inch thick, using as little flour as possible, and cut with a cake or biscuit cutter; put a little melted butter on one-half and lap nearly over on the other half; place in order in the pan, about three-quarters of an inch apart; again let rise until very light and bake in a quick oven. The rolls may be rubbed with a little beaten egg and milk just before baking if one so fancies, or a little powdered sugar and cinnamon may be dusted over as they are taken from the oven.

Rubber Rings.

Can rubber rings belonging to the self-sealing jars, which have become so hardened that they are useless, be replaced? DOMESTIC.

ANS.—Yes. If the dealer who furnished you with the cans does not keep them, have him order them, or write for them yourself direct to the manufacturer's.

Lemons.

Can lemons be kept fresh for any length of time so that they may be used for pies, lemonado, etc.? HOUSEWIFE.

ANS.—They may be, by covering with cold water and changing the water every second day.

Curry Powder.

So many dishes now-a-days are seasoned with curry powder, a seasoning of which I know nothing, I should be pleased if you would furnish me with a recipe. MRS. H. C.

ANS.—Two ounces of coriander seed; three-quarters of an ounce of cardamon seed; two ounces of cumin seed; three-quarters of an ounce of caraway seed; three-quarters of an ounce of Cayenne pepper; half of an ounce of black pepper; half of an ounce of fenugreek seed; one-fourth ounce of cinnamon; one-fourth ounce of mace; half of an ounce of cloves; and ten ounces of turmeric. Each of the above should be powdered fine and set before the fire to dry, then sift, put in glass bottles and cork tightly. One small teaspoonful of the above is sufficient to season anything for most persons. It gives a very nice flavor to boiled meats, gravies and stews.

Infants' Powder.

Please give directions for a harmless powder? MOTHER.

ANS.—Perfumed corn-starch we have found to make a most excellent powder. It is as little injurious as any cosmetic can be, is inexpensive and answers every purpose for which it is intended. To prepare: Take any suitable paper box and cover the bottom to the depth of one-half inch with corn-starch; over this place a piece of writing paper saturated with any extract—we use patchouly—and cover with starch to the depth of an inch. Repeat until you have in a sufficient quantity of the corn-starch; cover tightly and tie up in paper for a few days.

Tablecloths and Napkins.

Should tablecloths and napkins be starched? M. S.

ANS.—There is a softness and elegance about the unstarched cloth while the starched one is stiff and unyielding. As for napkins, the purpose for which they are to be used ought to determine whether they should be soft and pliable or stiff as a shingle.

News of the Week.

POLITICAL.

Monday, Aug. 12, 1878.

A congressional committee of three, with Mr. Hewitt at its head, has been in session during the week in this city to obtain from representative working men a statement of their views as to the cause of the present lack of employment through the country and also as to the best remedies therefor. Before them have appeared a large number of men belonging to various avocations and to different labor, socialistic, communistic and other associations the names even of which have been for the most part unknown to the general public. The opinions delivered were generally crude and often so extreme that to carry them out would completely revolutionize society. The general drift of them was that the depression is mainly due to the accumulation of capital in the hands of the wealthy, to the grasping greed of these, and the high rate of interest they charge as well as to the unfair advantage given them by the invention of labor-saving machinery, and perhaps more than all, to the scarcity of currency caused by contraction and the "insane" attempt at resumption.

Among the various remedies suggested or insisted upon were: that government should become the employer of all labor, pooling the profits and meting these out according to the wants of each family; that government should give a free homestead to each idle man and loan him say $5000 to work the farm, the same to be secured by mortgage and payable in a stipulated time; that government should issue all the way from ten to forty thousand millions in greenbacks, so that every one might have a pocketful and that these should be legal tender for all debts; that the government should at once do something; that it should start a vast series of works of internal improvement to cost at least $10,000,000,000; that the circulation should be increased to $58 per head; that all labor should be co-operative; that all employed in all offices under government or elsewhere, from the president to the street-sweeper, should receive the same pay; that taxation should be graduated, so that the accumulation of capital would be impossible; that more than six per cent interest should never be allowed; that all interest whatever should be absolutely prohibited; that eight hours should be a day's work; that six hours should be a day's work; that inventors of patents should be rewarded by the government and their devices declared public property; that church property should be taxed; that the religion of humanity should be made to supersede all others, and a multitude of similar panaceas.

Kearney, the California agitator, has been spouting wildly on Boston Common and elsewhere about the "Hub," and has formed a coalition with Ben. Butler with a view to the election of the latter next fall to the governorship of Massachusetts on the labor-greenback ticket. Butler, too, has been delivering his opinions up at Biddeford, Maine; and, unlike the California Irishman, he always has opinions which, if not correct, are nevertheless worth listening to. He left the Democratic and Republican parties because the former wished to destroy the nation, and the latter, founded to vindicate the rights of the lowest class of laborers, is now held bound hand and foot by capitalists. Ben talks interlainingly always, and often instructively; whereas his new ally merely pours forth a torrent of threats against capitalists and organized society, larded with a copious flood of billingsgate. He wishes all workingmen, whatever their religion, nationality or political affinity, "to pool" their issues until victory has been achieved. This is the dull season for news—Congress not in session, no elections, no interesting foreign developments—and accordingly the press generally is giving much more space to this foul-mouthed demagogue than would be accorded him at any other season.

Manton Marble, late editor of the N. Y. World, has, in a circular letter, given an inside history of Mr. Tilden's attitude towards the Electoral Commission which gave the presidency to his rival. He was always steadily opposed to the appointment of this court, insisting that it was unconstitutional, that the House of Representatives had a right to take part in counting the vote for president, and that the final decision of the question rested with that body. These opinions he had from the outset made known to the democratic leaders, and he was prepared to take all legitimate means to carry them into practice. It has been repeatedly said that the democrats lost the presidency through Tilden's timidity, uncertainty and vacillation; and this brochure is designed to remove this error and so strengthen Tilden's chances for a renomination as the democratic candidate in 1880.

The republican State Convention of Maine met on Tuesday at Portland, and renominated Governor Connor by acclamation. Resolutions of the usual republican import were passed and the administration utterly ignored. Blaine was the guiding spirit of the assembly—and Blaine is not a warm admirer of Hayes or his cabinet. By the way, the President has been interviewed with regard to the members of this, and expresses himself thoroughly satisfied with every one of them, and hopes they will all remain with him till the end of his term. A new Bureau has been established in the Interior Department for the purpose of crediting the accounts of the forty-four railroad companies in which the government is interested on account of the aid in the shape of land grants, indorsement of bonds, etc, given in building them. The election returns from North Carolina show slight republican gains and a strong independent movement, so that it is thought the republicans and independents combined can elect Merrimon senator against Vance, the Bourbon candidate. From the strong democratic press of the South there are numerous complaints of the treachery, villainy, and general terpitude of the independent voters, who seem likely to become the recipients of not a few of the compliments formerly reserved for the republicans.

The story that Editor Watterson of the Louisville Courier-Journal wants to be secretary of the United States Senate, which he has just denied, seems to have grown out of the fact that his father, Harvey Watterson, a congressman a generation ago, is a candidate for the place.

The clergyman is getting into politics a good deal out West this year. Rev. Gilbert de La Matyr was recently nominated for Congress by the nationals of the Indianapolis district, and now Rev. George Pepper has been taken by those of the 15th Ohio, both ministers having won the hearts of the new party by sermons they have preached on labor themes, Pepper having declared during the railroad strike last summer, that if any corner in hell was hotter than another, Tom Scott and other railroad magnates ought to be put there. Up in the 4th Michigan district the democrats have also fallen back on the clerical profession for a candidate, nominating Rev. A. D. Eldred, a leading Methodist minister. There is little prospect, however, that any one of the three will be called upon to serve the country.

MISCELLANEOUS.

Commissioner Baum, of the Interior Department, has written to the Southern collectors of internal revenue, virtually offering amnesty for past offenses to illicit distillers, if they will cease violating the law. From 60 to 80 "moonshiners" have surrendered in accordance with this agreement. The point of the entering wedge for Southern claims has just been driven in by a provision of the Sundry Civil Service Bill, allowing $10,000 to the Richmond and Danville Railroad on an old bill, whose payment, on account of its illegality, had twice been refused by the Department. Bankers, pretty nearly everywhere, are complaining of a glut of silver money which they cannot get into circulation, as greenbacks are more convenient, cheaper of transportation, and actually worth more in the money markets.

Another Boston defaulter! Conant is the name this one has disgraced by heavily swindling a bank of which he was the cashier. This illustration of the truth of some of Kearney's denunciation of dishonest capitalists, is now exciting the sympathy of the mawkish, behind prison bars. The Governor of Ohio is a bankrupt. He was the head of the firm of Bishop & Co., the largest grocery house in Cincinnati, doing a trade of over $3,000,000 a year. Shrinkage of real estate, and bad debts chiefly caused the ruin—liabilities $360,000, and its very unlikely creditors will get more than 40 cents on the dollar. The Pacific Railroads have issued a circular threatening to eject persons who attempt to preempt land under the "so-called decision" of Sec. Schurz. Most likely a test case will soon be made up for a judicial decision on the matter.

By the laws of Virginia, to prevent miscegenation, should a white person marry a colored one, both are liable to two years in the penitentiary, and the minister or official who dares to tie the knot, is liable to be fined $200 for the indiscretion. The enforcement of this law is now making three people miserable in Alexandria, Va. Six hundred journeymen shoemakers are on a strike in Chicago. They demand $12 instead of $9 a week; refuse to compromise on $10.50, and the "bosses" say they will get their work done cheaper in the East. St. Louis has 26 mills, with a capacity of 12,000 barrels a day; and a third more flour is produced there this year than last. In the past six months the receipts of wheat have been 4,832,693 bushels against 2,610,811 bushels the same time last year; and already the sanguine citizens dream of beating Chicago, and becoming the flour and grain market of the world. Well, perhaps their dreams may turn out true, after they have had about a score of first-class funerals. Twenty thousand cabin passengers have left this port for Europe this summer—the largest number on record during any single season. How about hard times!

Rarus, the new King of the trotting track, failed at Rochester to make his Buffalo time, the best he could do being 2.17. During the week there have been several violent storms or tornadoes in different parts of the country, the most destructive of which occurred at Wallingford, Conn., on Friday last. The path of the hurricane was about a quarter of a mile broad; it swept in full force only over a length of about three miles, and it lasted less than ten minutes. Its track was chiefly along the outskirts of the town, where there were a large number of ricketty frame houses, the homes of mechanics and poor people. These it leveled as it passed, crushing many of the inhabitants beneath the ruins, or slaying them with the beams and timbers it bore along in its course. Twenty-eight deaths have already occurred, and as a great number are more or less severely wounded, there will probably be more fatal cases. The pecuniary damage cannot be less than $250,000. Out at Lincoln, New Mexico, postmaster Dolan refused to surrender the office to McSween. The latter attacked the place at the head of 61 backers, and after firing at long range for four days, set the office on fire, and in a hand to hand struggle killed Dolan and eight of his men. A number of others were wounded on both sides. Four companies of soldiers were only nine miles away, but owing to the late law prohibiting their interference as a posse comitatus, they could not be used to quell the disturbance.

The ambassador who lately arrived from China, is at present at Hartford, Conn., and will not go to Washington until September. There he will be installed in the "Stewart Palace," and make a grand show. It is expected that, while commercial relations will be improved, the treaty stipulation in regard to immigration will be amended with the consent of the Celestials, who want to keep all of their 450,000,000 at home. There has been an over-issue of $100,000 on a Pennsylvania State loan for $400,000, made in 1853. Some rascal in office has pocketed the proceeds, and now the books relating to the matter are missing. The loan was payable this year, the legitimate amount of it has already been paid; and the above amount is still outstanding. There is no means of discriminating between the over-issue and the other bonds, but no more will be paid until the legislature acts. There were political thieves in the days of old, also!

The railroad men in session at Long Branch last week fixed the rates of freight for cattle from western points to the sea-board on the basis of 60 cents per cwt from Chicago to New York; 13 trunk and western lines represented.

FOREIGN.

The Austrians are meeting with a good deal of opposition in occupying Bosnia and Herzegovina. It is reported that there are in the field against them more than 100,000 well armed Bosnians, Arnauts, Albanians and disbanded Turkish troops. The country is very hilly, and the insurgents have fortified all the passes and strategic points along the roads. Several severe skirmishes have already taken place, the latest reported on Friday last, when 500 Bosnians were killed and 700 taken prisoners. This morning's telegrams announce that Turkey and Austria have come to an agreement with regard to the duration of the latter's occupation of the country and that the Sultan has notified the combatants accordingly that the Austrians enter the country as friends and that all resistance to them will be useless. To insure this, they are pouring forward reinforcements. The Porte is disposed to make liberal concessions to Crete; but is resolved to refuse the Grecian demands as unjustifiable.

An explosion occurred on the 2nd inst. in the fortification of Kars causing a fire which destroyed nearly the whole town. The inhabitants of Batoum, ceded to Russia, are resolved to resist and together with the neighboring semi-savage tribes have taken up arms to the number of 35,000 men. The Russians are reported to be still busily fortifying positions along the Black Sea and they do not believe the war yet ended.

It is Cardinal Nina that succeeds Cardinal Franchi as papal Secretary of State, not Luca, as the telegram said last week. He is reported of a liberal turn of mind, and is continuing the negotiations with Bismark. It is said that peace has been agreed upon between the Empire and the Vatican, on condition of free pardon to all orders of clergy for past offenses against the Falk laws; these laws are to continue on the statute books

however, but not to be enforced, just as in England the laws against the Roman Catholic hierarchy, passed in 1850, are still in existence, but have never been put into operation. By the way Falk, the author of these laws and one of the ministry failed to secure an election lately as did Bismarck's son, Count Herbert, and even the great Von Moltke.

The elections in Germany have been held, and the returns show the following resuls as regards the great parties: 93 Conservatives, 110 of the various Liberal parties and 96 Ultramontanes. Sixty-six second ballots will be necessary

The Liverpool Chamber of Commerce presented an address on Wednesday to General Fairchild on the occasion of his quitting the American Consulate. Mr. W. B. Forwood, president of the Chamber, prefaced the address with a few complimentary remarks. General Fairchild returned thanks. Mlle. Albani, prima donna, and Mr. Ernest Gye were married in Warwick Street Chapel, London, on the 6th. The American Free Masons visiting England were entertained at a banquet on Wednesday night by the Grand Lodge at Free Masons' Hall, London. The English army supplementary estimate for additional expenditures in consequence of the war between Turkey and Russia has been issued. It amounts to £1,545,500. The French government at the request of the United States, has formally invited the foreign powers to the international monetary congress which began in Paris on Saturday. The Mark Lane Express reports that English wheat-cutting has commenced a week earlier this season than last year, thanks to the weather. In spite of complaints or blight and defective ears, advices in the main are satisfactory, and, unless there should be an unexpected deficiency, the crop will be a fair average one.

France has bestowed the cross of the legion of honor on the German Prince Hohenlohe and Count von Bulow as a recognition of their kindness to France at the Berlin congress. It is also rumored that Marshal MacMahon declined attending the English concerts at the Trocadero, saying "No, that coquin, Disraeli, has cheated me." The first political mass-meeting ever held in Cuba took place at Havana, Saturday week. It was held by the liberal party, with the object of arranging a political programme for the November elections, when deputies to the Spanish Cortes will be chosen. Ricardo Galbis, government secretary, presided. Two programmes were submitted, and the meeting adjourned until the 10th, when a vote would be taken on them. The greatest order prevailed. Kossuth has published a sensational letter, bitterly attacking the occupation of Bosnia, and accusing the Austrian government of sacrificing the interests of Hungary. Garibaldi, too, is out with a proclamation that slaves have always a right to rebel, and urging the inhabitants of Trieste to take up arms and take to the mountains.

HERMAN.

VARIOUS.

Turkeys are natives of America, and were consequently unknown to the ancients. They were first brought to England about 1523, and to France about 1570.

Prince Bismarck signed the treaty of Berlin with an eagle's quill, ornamented with a silver figure of an Angel of Peace, which was presented to him for the purpose.

An influx of Mennonites is anticipated between this and 1880, in which year their exemption from military service will end in Russia, where they number 200,000.

In 1876, wolves in the Russian province of Samara, devoured 5,880 horses and horned cattle, 56,000 small cattle, 22,000 domestic fowls, and more than 1,000 dogs. In 1877 their ravages were even greater, and the loss in the two years is estimated at $600,000.

Two years ago Wisconsin offered a prize of $10,000 for a motor that would prove in all respects a desirable substitue for draught cattle on roads and for ordinary agricultural work. Three commissioners have just reported against a steam motor that answered all the requirements except that it was more expensive to run than a pair of horses.

Kearney's expenses on his oratorical tour in the East are not paid by him. He is not a bloated capitalist, though the owner of several trucks. Shortly before his departure from San Francisco a concert was given for his benefit that was, in point of attendance and peculiarity, one of the most successful ever witnessed in that city. The amount netted was sufficient to pay all the cost of a three months' trip to the East, and will leave something over.

When Patti sings in Berlin in the fall, it will not be in the Royal Opera House. The Emperor declined to permit her to appear there, solely on account of the enormous price—$2,500 per night—demanded by her for the services of herself and Nicolini. That would make it necessary to fix the cost of a seat in the parquet at $5 or more—a thing the Emperor would not hear of in these hard times. Nevertheless, Berlin must have Patti, and she is to sing on another stage at her own price.

The island of Cyprus at one time contained nine different kingdoms, and more than a million inhabitants. Owing to the alleged peculiar temperament of its people, it was called "the home of love and beauty."

Everybody who has been at Brussels has visited its beautiful Botanical gardens. They are principally the result of the labors of M. du Mosher, who died last month. He was a minister of State as well as the first botanist in Belgium.

The loss of the German ironclad Grosser Kurfurst has had a disastrous effect upon the fisheries at Folkstone. Many of the bodies picked up have been found to be sadly mutilated by the fish, and so the inhabitants generally have declined to take part in "eating the Germans," as they put it.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Aug. 10, 1878

BEANS AND PEAS.—There is only a light business in medlums or marrows, and with some holders forcing stock on the market prices are weak; quoted extremes are rarely obtained. White kidney and pea beans have no regular call; Red Kidney scarce and held at a fancy price for very choice. Green peas with a better supply on a shade off, $1.20@1.25. Southern B. E. peas, new crop, will appear in about ten days: old nominal. Canadian field peas in bulk and bond quiet at 76½@77c.

Receipts of beans past week, 5,389 bush.

Exports past week, 600 bbls, beans and only 38 bush. peas.

We quote medium beans, prime, $1 52½@1 55; fair to good, $1 35@1 50; marrows, prime, free on board ship, fair to good, $1 55@1 57½; Pea, $1 35@1 50; white $1 60@$1 62½; kidney, $1 35@1 50; red do., $3 25@3 50; black $2 35@2 40; Lima, $3 75@4 25.

BEESWAX.—There is a very meager business but prices steady: Western and Southern quoted 27@28c.

Exports past week, 458 lbs. Since Jan. 1st 41,425 do. Same time last year, 29,587.

BROOM CORN.—There is very little doing and prices unsettled. Quotations are: 6@6½c. for hurl and short brush; 5@6c. for medium green, and 4@4½c. for red and red tipped per lb.

BUTTER.—Receipts for the week 32,661 pkgs.; do. last week, 35,316 do. Exports past week, 12,909 pkgs. State butter has advanced with scarcity of fine qualities, but the market is not steadily brisk with the new figures. The Southern demand, which calls mainly for firkins, is light. Yellow fever at New Orleans checking some business. Western creamery has ruled dull most of the week, and for wholesale parcels has been quoted two or three cents under State; at the close, however, with hardly enough fine State to go around, better figures are quotable. Shippers are moderating their purchases: native stock abroad is going into the British markets and operators here will hold up a while to see how American will turn. Besides there is a prospect of Canada sending her surplus, and if the amount proves large our recent rate of exports added would be apt to swamp the market on the other side. The total for the week is large, but we think does not include much late buying. Western dairy and a few marks of factory sell steadily to the under trade, while some fancy marks of Ohio and other points exceed the extreme.

State creamery, choice, 23@24c.; other, 20@22c.; half tubs and pails, choice, 20@21c.; other, 13@17c.; Welsh tubs, best, 17@18c.; other, 12@14c.; poor State, 9@11c.; State firkins, 17@20c.; Western creamery, choice, 22@25c.; other, 18@20c.; Western dairy, best, 13@14c.; other, 9@12c.; factory (ladle packed), 9½@10c.; other, 6½@8c.; milled Western, 5½@8c.; old and grease, 3@5c.

Comparative receipts and exports past three years.

	Receipts, pkgs.	Exports firkins.
June 1st, '78 to August 1st, '78.....	219,650	60,802
June 1st, '77 to August 1st, '77.....	241,075	44,685
June 1st, '76 to August 1st, '76.....	205,780	11,159

CHEESE.—Much more moderate. Receipts this week and the supplies in better condition, have tended to a slight advance. The fancy factories have been pretty closely picked out. The exports for the week were 47,300 boxes.

Latest sales are tuney, 7¾@8c.; 6¼@7¾c. for good and prime; 6@6½c. for fair; 4@5¼c. for half skimmed; 2@3½c. for skimmed. State, farm dairy at 6@6¾c. for good to choice, 5@6c. for fair to good and 2@3c. for poor skimmed. Wisconsin factory, fine to fancy, 7¼@7¾c.; do. good to prime, 6@6¾c.; do fair, to good 5¾@6c.; Western factory, fine, full cream, cheddar, 6¾@6¾c.; do. fine, full cream, flat, 6¾@6¾c; do. slightly skimmed, flat, 5¾@6¼c.; do. half skimmed, 4@5c.; do. full skimmed, 2@3c.

Gold closes at 100⅛.

Liverpool cable quotation, 43s.

Exports, past week 80,500 boxes.

COMPARATIVE RECEIPTS AND EXPORTS FOR THE LAST THREE YEARS.

	Receipts, pkgs.	Exports. lbs.

June 1, '77 to Aug. 1, '77.....	812,252	39,934,798
June 1, '76 to Aug. 1, '76.....	659,613	30,138,462

COTTON.—There has been a variable market, but on the whole a gain has been made, with a liberal business. Latest quotations are for August, 11.88c.; for September, 11.56c.; for October, 11.32c.; for November, 11.14c.; for December, 11.11@11.12c.. for January, 11.12@11.14c.; for February, 11 17@11.18c.; for March, 11.24@11.26c.; for April, 11.32@11.33c.; for May, 11.40, and June, 11.46@11.48.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

DRIED FRUITS.—There is a meagre showing of business; blackberries have declined, being more plenty; small lots of new apples have sold at 3¼; otherwise there are no important features.

New blackberries, are quoted at 6¼c. Peaches—Georgia peeled, 4@5c.; do. new, 4@5c. for poor to prime; unpeeled old halves, 3½@4c.; quarters, 3@3½c. Pitted cherries, 14c.; New York State plums, 12c.; southern plums, nominal. Apples—State quarters, 3½@4c.; do. sliced, prime, 4½c.; good, 3½@4c.; western quarters, 2@3c.; southern at 4@4½c. for prime sliced; 3@3½c. for fair to good; southern quarters, 2@3c.; Tennessee quarters, in bags, at 1½@2c. New raspberries, 22@22½c., and evaporated, 24@25c.

Exports past week, 209 pkgs. apples. Since Jan. 1st, 10,535 do. Same time last year, 28,485 do.

EGGS.—Receipts for the week, 4,618 bbls.; do. last 6,002 do. The market is in a decidedly better shape after running a long and unprofitable term. Western and Canadian have again obtained a place in regular sales, though State and the other near points have a quick sale. N. J., L. I. and up river 15@16c.; State and Penn. 14@15c.; Western and Canadian fresh 13½@14c.; poor stock 12@13c.

FRESH FRUITS.—It is quite a struggle for New York to get a fair share of the light crop of peaches! Philadelphia being so important a buyer this season. Prices are likely to rule high the whole season. Fine qualities, probably better than for several years are in market. The principle varieties are now Crawfords and Yorks. A few N. C. quoted $2@3 crate; Del. crates, $1.75@2.25; baskets, $1.25@1.75; extras, $2. N. J. prematures, 50@87c. Apples are a drug; a single bbl. must be very fancy to make $2; Nyack pippins, $1.25@1.50; Orange do., 75c.@$1.25. Roughs, $1.25@1.50. Southern Bartlett pears, prime crate, $3@3 50; poor, $1.50@2; Dutchess, $2.75@4.00. California pears out. Clapp's Favorite, bol., $6; Bell, $3.50@4; Bloodgood, $1@; Catherine, $4; Scooter, $3; Jargonelle, $3@3.50, cooking, $2@3. Plums, egg and gages, bbl., $6; blue, $1.50@1.75 crate. Grapes, N. C., Delaware, 10@12c. lb.; Ives. Seedling, 5@8c.; Hartford and Concord, 6@8c. Whortleberries, $2@2.50 bush. Last sales of blackberries, 3@4c. pint. Watermelons, prime, $22@25 per 100; others, $5@15. Muskmelons, $2,50@3.50 N. J.; $2@3 Southern. Cal. plums, $2@3 50 box. White grapes, 6@7 case of 40 lbs. Hothouse grapes, black Hamburg and muskat 75c.@$1.00 lb. Sweet water 50c. Peanuts dull, holders ready to accept inside rates. Va. hand-picked, $1.45@1.50 bush.; other $1.25@1.35. Pecans quotable next week.

FEED.—Sales of 40 lbs., av. at $14@14.50; 60 lbs., $14@15; 80 lbs., $14.50@15.50; 100 lbs., $16.50@$18.

FLOUR.—The tendency has been a little higher, on active trade demand, and in sympathy as well with the rise in wheat.

Latest prices are $3.35@4.00 for very inferior to fancy superfine State; $4.00@4.20 for poor to good extra do. odd lots and lines; $4.20@4.50 for good to very choice do.; $3.35@4.00 for very poor to fancy superfine Indiana, Iowa, Michigan, Ohio, &c., $4.00@4.20 for inferior to good shipping extra do. and $4.20@4.50 for good to very fancy extra do.; common to about choice white wheat extras, $4.30@5.40; choice to very fancy do. at $5.50@6.50; red and amber winter wheat, inferior to very choice trade and family at $4.15@5.75; round hoop Ohio at $4.00@$4.30, and trade and family brands of do. at $4.35@$5.75, the latter rate for choice, (very choice to fancy lots quoted higher); St. Louis, $4.25@5.00 for very poor to good extra, and $5.00@6.25 for good to very fancy; Minnesota clear, very inferior to very choice at $4.20@5.90 (fancy brands at higher prices); Minnesota "straight," very inferior to very fancy, at $5.25@7.25, and patent poor to strictly fancy at $5.50@8.75; unsound stock at from $2.00@5.25; city mill extra at $5 15@5.75 for West Indies (the latter rate for fancy in new packages); do. for England, 4.15@$4.20; do. trade and family extras, $5.75@6.75; do. for South America, $5.25@5.85 for fair to fancy; No. 2 $3.25@3.25 for inferior to very fancy.

CORN MEAL.—Is selling at $2.80@2.95 for Brandywine, and $2.15@2.40 for Western yellow.

GRAIN.—Wheat has been active at a decided advance; a good fair business in progress for exporters.

Sales are of No. 2 red at $1 09@$1 11; do., August option, at $1.10⅝@1.11⅜; do., deliveries in August, at $1.10⅝@1.11; do. September options, at $1.10⅛@1.11; do., October option, at $1.10⅜@1.11; No. 2 red steamer grade, spot in lots, at $1.08⅝@1.18⅝; ungraded white at $1.10@1.21; ungraded amber at $1.06@1.13; ungraded red at $1.03@1.05; No. 1 red, at $1 11@1 11⅛; do., steamer grade at $1 09⅜; No. 2 amber at $1 09¾@1.11; do., steamer grade, at $1.06@1.08⅜; No. 1 amber at $1.13@1 13⅜; white State, steamer grade, at $1 13@1 20; No. 1 white at $1 21@1 23; No. 2 white at $1 15@1 16⅜; No. 3 white at $1 11@1 11; New York No. 2 spring, September option, at $1 07⅝@1 08, Rye at 61@63c. for western, and 63@63c. for State. Corn is active; quoted for No. 2, August option, at 49c.; No. 2, September option, at 48⅝@12¾c.; do., October option, at 51c.; steamer mixed, August option, at 48c.; do., September option, at 49c.; do., October option at 50c.; steamer mixed at 47¾@48c.; New York No. 2 at 49@49½c.; chiefly at 49¼c.; New York No. 3 at 46½@46¾c.; and ungraded mixed at 45@49c. Oats have ruled lower, but closed strong; latest sales are of New York No. 2 white at @ 33½@33¾c.; New York No. 3 white at 31@31½c.; New York No. 1 at 33@33½c.; New York No. 2 at 32½c.; New York No. 1 white at 36@36½c.; New York rejected at 30c.; New York No. 2, August delivery, at 31c.; white western at 32@37½c.; mixed western at 30½@33½c.; white State at 33@35c.; mixed State at 31½@34c.; New York extra quoted at 34½c.; New York No. 3 at 30½@31c.

HAY AND STRAW.—New hay is in larger supply and easy in price. Old hay is taken promptly at steady figures.

New hay is selling at 45@75c., old bale hay, 44@50c. for shipping and 65@80c. for retail qualities. Straw quoted at 35@45c. for long rye; 30@45c.; for short rye, and 20c. for oat.

Exports past week 445 bales. Since Jan. 1st, 41,425 do.; same time last year, 29,575 do.

HIGH WINES sell at $1.06½ regular.

HOPS.—The position of the market is essentially as last week. Trade is entirely from brewers, and prices unchanged.

Quotations are for New Yorks, good to prime, 10@12c.; do., low to fair, 7@9c.; Eastern, 7@10c.; Wisconsin, 7@10c.; Yearlings, 2@ 3c.; Olds, all growths, 1@2c.; Pacific Coast hops, 10@12c.

LEATHER.—Sales at 19½@20c. for light hemlock; 19½@21½c. for middle; 20@21½c. for heavy and 17½@19c. for good damaged.

OIL-CAKE.—Is scarce and held firm at $30 per ton.

SALT.—Sales at $1@1.15 for sack lots other than Ashton's, which latter brings $2.50

POULTRY AND GAME.—Live poultry has ruled dull and easy in price: Chickens particularly so. The outlook is better as the Jewish trade is larger and Havana orders are likely to be filled. We quote: Chickens, N. J. 13@14c.; State and Penn., 12c@13.; Western and Southern 11@12c. Fowls—N. J. 12@13c; State and Penn., 11@12c.; S. & W., 11@11½c.; Roosters, 5@6c. Turkeys, choice, 12@14c.; poor, 10c.; Ducks—Western, 45@60; Southern, 40@55c.; N. J. Spring, 50c.@$1; N. J. Geese, $1.25@1.50; S. & W. 1@1.25.

The weather has been hot and muggy and dressed has shown up badly; prices are weak. Turkeys, dry picked, 14@16c.; other, 13@15c. Fine N. J. Chickens, Phila. dry picked, 14@16c; N. J. 13@14c.; State, 12@13c.; Western, 11@12c. Phila. fowls, 13@14c.; N. J., 12@13c.; State and Western, 10@12. Young Ducks, N. J., 12@14 for prime.

The supply of such few items of game as are current, is very small, and following rates could be readily obtained: Eng. snipe, $1 25@1 50 doz.; Woodcock, pairs, 75@85c. Stall-fed pigeons, grown, $1 25@$1.37 doz.; Young, $1@1.12. Tame squab, $1.50@1.62.

PROVISIONS.—The tendency has been upward with a brisk trading. Mess pork quoted $10 75@11,25 for spot lots; $10 75@$10 80 for August and September; $10 85@10 90 for October; Bacon at 6¼c. for long clear. Lard—at $7 80@7 82½ for spot lots; $7 82½ for September; $7 85 for October, $7 67½@7 70 for the year option. Stearine at 9@9½ for choice city, and 8¾@9 for western. Tallow at 6 15-16 for prime. Beef hams at $21 50. Beef—for extra mess, $11 75@$13; plain mess, $10@11 50; packet, $11 25@12 for bbls. and $16@17 for lcs.; family at $13@14; extra India mess, $19@20 for city brands; do. Philadelphia, $18@$19.

TOBACCO.—The receipts have fallen off, and the export and home trade movement continue of a very fair description, with prices steady.

VEGETABLES.—Exports potatoes past week, 3,160 bbls. Potatoes are in larger supply and prices are firmer; general quality not good; trade fair, with the help of exportation: N. J. and L. I., E. Rose, $1.25@1.50 per bbl.; Culls, 50@75c. Sweet potatoes, Va., yellow, $3.50@4; red, $2.50@3. Tomatoes have declined to 30c. for 3 peck package. Sweet corn, per 100, $1@1.25. Lima beans, bag, $2 50@3; string beans, 50@75c Cucumbers, 100, 25@50c. per 100. Onions, Chester red, $1 25@1.50 bbl.; yellow, $1.5'. Southern, $1@1 25. Marrow squash, $1.75@2.; crook-neck, $1.25@1.50; white, $1@1.5 . Bull-nose peppers, $2.50 Beets, per 100 bun., $1@1.25; carrots do., $1@1 25. Egg plants, 100, 6@9c. lower. Lettuce, bbl., 50@62c. Cabbages, Flat Dutch, $4@5; red, 5@6 Okra, per 100, 10@15c.

WOOL.—There has been more cautious tending this week; manufacturers buy wholly as against actual needs. Prices generally rule firm and as quoted last week.

Ohio, Pennsylvania and West Virginia—XXX and picklock, 40@43c.; XX, 37@39; X, 37@38; No. 1, 37@39c.; No. 2, 34@37c; common, 31@34c.; combing and De Laine, 42@45c.

New York, Michigan, Indiana and Wisconsin. XX, 34@37c.; X, 34@37c.; No. 1, 36@38c.; No. 2, 31@33c. common, 28@31c.; combing and De Laine, 39@42c.

Iowa, Vermont and Illinois—X and XX 33@36c.; No. 1, 34@36c.; No. 2, 29@32c.; combing, 37@40c.

Missouri, Kentucky, and Tennessee—Washed fleece, 30@35c.; unwashed, 24@28c.; unwashed combing, 29@32c.

LIVE STOCK MARKETS

Saturday, Aug. 10, 1878.

BEEVES.—Receipts for the week, 11,115 head; do., last give some encouragement, but it was not kept up, last week, 12,825 do. A spurt in prices on Wednesday except for first-class cattle. Texas and grass fed stock were very weak at the close. The top price of the week is 10c.; the range, Texas, 6@6¾c.; Colorado, 7@8¾c.; Natives, 7½@10c. Some of the later shipments lost $50@80 per car-load for owners.

COWS AND CALVES.—No change of importance.

VEAL CALVES.—Prices low, and stock has been well cleared up at 5@7c., the extreme paid for fine State and N. J. Buttermilk and grassers, 2½@3½c.

SHEEP AND LAMBS.—Receipts for the week, 24,509 head; do. last week, 28,212 do. Trade is slow in live; retail market trade dull. Poor to prime sheep 3¼@4¾c.; do. lambs, 4@6c.

SWINE.—Receipts for the week, 20,637 head; do. last week, 18,500. No live on sale; stock going direct to packers. Nominal N. Y. rate, $4.60@4.70 per 100.

Reading for the Young.

GRANDMA A PRISONER.

As grandma—dear grandma, the life of the house—
  Slept into her closet one day,
She left little Arthur as still as a mouse,
  On the floor of her chamber at play.

While she shook out her dresses and smoothed out her shawl,
  And straightened the things on the shelf,
The boy, never dreaming of what might befall,
  Toddled up to the door, little elf!

In a twinkling he shut it and laughed in glee,!
  "'Ou tant tum out any more!"
"O, Arthur, my dear little boy," cried she,
  "Now how can I open the door!"

He could not reach the knob, she knew,
  And there was no knob inside,
And the hall-door was shut! O, what should she do!
  "Call—call to your aunty," she cried.

The gay little mischievous laughter ceased,
  While she stood perplexed in the dark;
As his fun died out and his fear increased,
  O, how he did call and bark!

"Now knock at the chamber-door," cried she,
  "And aunty will surely hear,"
And he knocked, and knocked again for me,
  Beginning to sob for fear.

I sat aloft in my easy-chair,
  My thoughts on my book intent,
And though calling and knocking reached me there,
  I dreamed not what they meant.

Grandma, indulgent as grandmas are,!
  Was letting him hammer and shout—
So I said to myself—and I did not care;
  My nerves at that distance were stout!

At length I leisurely sauntered down;
  And entered the room when he ran:
Sobbing, and holding me fast by the gown,
  To tell me the story began.

I caught the words "c'oset" and "grandma;" no more
  Was needed the whole to relate:
In a trice I had opened the closet-door,
  And the joy of that moment was great.

"Now what would grandma have done," said she,
  As he kissed her o'er and o'er,
"If no one had come to my boy and me
  To open the closet-door?"

While the tears still flowed from his shining eyes
  Like drops from a brimming cup,
"What tould 'ou do?" he cried, in surprise,
  "'Ou tould wait till me grow up!" [*Companion.*

"POCKET-MONEY FOR THE YOUNG PEOPLE."—No. 13.

ANNIE L. JACK.

"Boys," said the father on his return from the city, "I have an order for 25 young cedars a foot long. So, as soon as you get up in the morning, Will, you can go to the woods and get them. You know where they grow, and the dollar is to be for yourself. The next order is to be yours," he added, nodding to a younger lad. In this way, and by gathering forest tree seeds, now in demand, boys can often earn a few dollars, learning quickly to know salable trees and the proper ripeness of seed. If a good selection is made, the city seedsmen soon learn where to send when they receive an order for trees—as is very often the case—from people who cannot pay nursery prices, or from nurserymen who have not the trees required.

One of our little men grows corn for his pocket-money. The ground is prepared as for field corn, and he always plants Early Minnesota as coming to green ears earlier than any kind we have tried. It is of rather dwarf habit, and can be planted a little closer than tall varieties; and as he sows he sings,

"One for the blackbird, two for the crow,
One for the cut-worm, and two to grow."

The profit of this crop is in being early in market, for although sweet and well-flavored, it is of no account when the large, coarse, common white corn is ready, so persistent are people to have big ears, whether the quality is good or not. When below 15 cents per dozen we let it ripen for seed, and have no trouble in disposing of it to seedsmen who know what we grow. In this way one small boy can hoe his patch of corn, and even learn to cultivate and keep it clean, and if careful to get a good variety, *very early*, and to grow only one kind, so as to be able to warrant the seed, he can easily realize twenty-five dollars from a quarter of an acre.

There is hardly any garden where a place cannot be found where two or three or even a dozen grape-vines may be planted—plant *Concord* for *profit*. No matter who may condemn them, and prefer finer sorts: we all know that they are not Black Hamburg or even Eumelan, but they are *hardy, productive* and abundant bearers, the "grape for the million," and they will *sell*. The prunings in the fall, if cut carefully, will make young plants that the boys will sell too, as when two years old they bring 25 cents each. The grapes, put up in boxes or baskets, are very cheap in the fall, but for fresh, well grown bunches there is always a market and money in them. The vine revels in black swamp muck and wood ashes and amply repays for care bestowed on it. If you are not tired of the prospect of a little work, I can tell you another time of more ways in which girls and boys can earn a nice little independent pocket-money.

THE BEAVER.

An animal that approaches near to man in the attributes of reason, reflection, foresight, and design, is the Beaver, whose name, as you know, is associated with the hats that are made from its soft downy under-fur. I call him an engineer; but I might with propriety style him an architect, a carpenter and a mason, for he unites all these occupations with a perseverance and energy that are remarkable. He constructs a habitation with floors, roofs, and separate apartments for storing food and for sleeping, and plasters the house over with the skill and effect of the most expert mason. But these are not the most curious works of the beaver, as you will learn.

In describing this animal, you will perceive how wonderfully he is adapted to carry on the operations necessary for his existence. The beaver is usually about two feet in length; the head is thick and pyramidal, with small eyes, short ears, almost concealed in its fur, a blunt nose, a thick and short neck, and a very strong compact body; the tail, about a foot in length, is partly enveloped in fur, and encased in close and compact scales, adjusted like those of the fish, and which, curved above, and broad and flat below, is particularly suited to the purposes for which this instrument seems to have been intended, namely, as a paddle and rudder to forward and regulate the animal's motion when swimming, and as a trowel to press together, and afterwards to plaster, the materials which it uses for the erection of its dwelling.

The fore-feet, which resemble in shape those of the rat, are small and short, having five divided toes, strongly armed with claws, well calculated for digging the holes in which are to be deposited the foundations of its building; and these feet, like the squirrel, the animal uses as hands, to convey substances to the mouth, or to assist in removing them from one place to another when collecting material. The hind feet are made large and powerful, like those of the goose, by a strong membrane, or web, which affords to the animal that facility in swimming that forms so peculiar a part of its habit. It is owing to this difference in the structure of the fore and hind legs that the beaver swims better than it walks. Its head, the whole of the body, and a part of its tail are covered with a double fur—the inner one being fine and glossy, while the outer one is formed of long, straight, and coarse hair, of a dark chestnut color, approaching to black; in a few, of a milky white, more rarely of a cream color, and sometimes of patches of black spots upon a white ground. This coat, while it adds to the warmth of the animal, seems intended, like the feathers of water-fowls, to throw off the water from its several points while the beaver is in the act of swimming, and thus to preserve the skin from the influence of the wet.

But the most interesting part of the animal's structure is the teeth, through the agency of which it is enabled to perform its surprising achievements. These, like those of the other animals of the same order, consist only of *molars*, or cheek teeth, and *incissors*, or cutting teeth. The molars, which are eight in each jaw, are divided by small ridges which increase their capability of grinding the hard substances, as wood, the bark of trees, and the like, which constitute the beaver's food, and of grasping them firmly when conveying them from one place to another; while the incissors, two above, and the same below, have a sharp, chisel-formed edge, with which the animal is enabled with great rapidity and dexterity to gnaw through and divide those trees and their branches used for its food, and as one of the chief materials of the buildings.

Thus these teeth serve the purposes of an axe, a saw, and an adze; and as they are in constant exercise, and liable to wear out, nature has provided the means of renewing them in exact proportion as they are exercised. You will thus perceive how the beaver is amply prepared for the busy purposes of its existence.

The food of the beaver consists of the bark of trees and shrubs, such as the birch, poplar, willow, &c., and of the roots of water-lilies and other water plants. In summer it will eat berries, leaves, and various kinds of herbage; and some persons have stated that it eats fish, but this is doubtful. They are extremely fond of water, and seldom wander far from some lake or river. In consequence of its habits, the beaver is also limited to wooded districts. When they are deprived of their habitations, they assemble in the early part of summer to erect others in a new, and, if possible, a more secure situation. For this purpose they select some part of a lake or river, on the banks of which they can easily procure a sufficient supply of timber, as well for their food as their building purposes. Having fixed upon the best situation, they begin to gnaw down one of the largest trees they can find, taking care that if on the bank of a river, it shall fall directly across the stream. As many as can conveniently sit around this tree continue to gnaw it about eighteen inches from the ground, until it begins to give way. While one party is thus employed, another is cutting down some smaller trees, and a third is making mortar of soft clay, and drawing it to the edge of the river, where the bridge or dam is to be. A gentleman who lived for some time in Canada, and had many opportunities of watching these curious animals, describes this part of their work as highly comical. After they have reduced the mortar or clay to a state of sufficient consistency and adhesiveness, one of the largest beavers lies down upon its back, and the others heap up a prodigious quantity of the prepared cement on its stomach. Thus laden, two carriers seize hold of their companion by the ears, and drag the passive creature to the water's edge; then entering the river, they float along to that part of the dam which more immediately requires the plastering assistance.

The use of these dams will be understood when I mention that the houses or lodges of beavers are grouped together near the edge of the water, the mud being scraped away from the front so that there may be a sufficient depth of water to allow free egress, even during the most severe frost. When the depth of water is not sufficient, a dam becomes necessary, by the side of which the lodge is placed. The dam is sometimes as much as *three hundred yards* in length, rising in a circular form towards the current; and particularly so where the currents are strong, sometimes extending on both sides, beyond the natural channel of the stream. The materials of which it is composed are sticks, roots, and branches, with stones, moss, grasses, and mud, mixed together so firmly as to become absolutely water-tight. Indeed, so remarkably solid is this part of their work, that "in places," says Hearne, "which have been long frequented by beavers undisturbed, their dams by constant repairing become a solid bank, capable of resisting a great force both of water and ice; and as the willow, poplar, and birch generally take root and shoot up, they by degrees form a kind of regular planted hedge, which I have seen in some places so tall that birds have built their nests among their branches." All this seems very marvelous, and beyond the blind impulse of instinct.

The next employment of the beavers is the division of the river below into equal compartments, the walls of which are raised to the surface of the water. These are made entirely of clay, and about two feet in thickness. Over these they build arches, and begin the erection of their apartments, which are of a circular form, and can only be entered from the water beneath. They are also arched and plastered so neatly, and with such durable materials, that they resist the force of the most violent and protracted rains, and severe storms. Each hut contains commonly one or two, but sometimes four families. The beavers cover their buildings each season, as soon as the frost sets in, with a new coat of plaster, their tails answering the twofold purpose of a spade and a trowel. Their store-rooms are constantly supplied with an abundance and variety of young and tender trees, of which they are particularly fond. In summer they make excursions in the woods, choosing the trees they mean to make use of, and marking the position of new settlements, when their increase of numbers requires them to plant colonies. Their wood-cutting begins at the end of summer. One of the worst enemies of the beaver, after man, is the glutton; and to protect themselves from that animal, whose principal food is small quadrupeds, they have subterraneous retreats along the banks of rivers or lakes, to which they retreat when they are attacked. The value of the fur makes the beaver an especial object of the hunter's labors. It is in winter, when the water is frozen, that these animals are destroyed in the greatest number. The hunter, on approaching the dam, cuts holes in the ice at a considerable distance from their habitations. Then, by breaking open the upper apartments, he succeeds in driving them under the ice; but as they cannot exist in the water without frequently rising to the surface to breathe, they are forced to the holes cut by the hunter, when their capture and death speedily follow.

From being quite numerous in our northern latitudes, these clever little animals have been so persistently hunted that, like the moose, deer, and bison, they are gradually being exterminated, and unless public sentiment intervenes to modify the destruction, our reminiscences of the beaver will be kept alive solely through the medium of museums. UNCLE TRUE.

FOOT-BALL.

It would be quite impossible for me to attempt to give within the limits of this article a description of the character of the game, and the rules and regulations adopted by various schools and clubs in foot-ball. As an humble but enthusiastic supporter of this pastime, I take the opportunity of expressing at the outset my strong antipathy for that brutal practice termed hacking, which can under no circumstances promote skill or interest, and indeed seems rather intended to enable a few powerful hulking fellows to keep all the fun to themselves. To call a thing by its right name, hacking means neither more nor less than kicking our adversary over, in order to get the ball away from him, a process which may give the particular school or club at which it is practiced a name for fierce playing; but it is not foot-ball. The real fact of the matter is, that some few individuals more amply blessed with muscle than brains, have come to the wise conclusion that ordinary foot-ball is very tame work, and that to give it vivacity the element of ferocity must be imported into it. They remind me very much of a certain General Boum. He is so tremendously war-like that he cannot take snuff like other people; but when he feels that his nose requires a little irritation, he draws a pistol out of his pocket, fires it off, and then snuffs the barrel. There is nothing a bit more extravagant in this than the insane length to which, not so long ago, hacking and fighting were carried. Goodness knows the shins come in for quite enough ill-usage in the unavoidable scrimmages that are inseparably attached to the game whenever and wherever it is played; and the knocking about that one gets is quite sufficient without any extra aids to bruises being introduced. It requires no small amount of courage and endurance to indulge in foot-ball, pure and simple, and I am sure there is no need to make it a struggle between a lot of wild beasts to see which can hurt and mangle the other most. I have seen some severe tussels in my time, and they excited far more emulation and display of prowess than all the hacking in the world ever could. On such occasions the real test of a player's merit was his ability to "dribble" and dodge with the ball; and when he had scientifically worked it to sufficiently close proximity to the adversary's base, to gently kick it into the hands of one of his own side, who was then entitled to take three yards and have a fair kick for the base. There was no nonsense about this, it really required considerable skill and a great deal of practice before that skill could be obtained. You might charge the other side as much as you liked, and give them as many spills when in a legitimate rescue of the ball from their attentions as might appear necessary; but to wait till one of them had got it in his arms, and then to rush up and kick his shins to make him let go was scarcely a practice to be countenanced. The truth is that all handling the ball in any shape or form is utterly and entirely a mistake; it is the one innovation on legitimate foot-ball that has done all the mischief, and afforded an opportunity for the introduction of a variety of novel elements, which go far to deprive the game of all pristine advantages. S. D

Sabbath Reading.

GETHSEMANE.

In golden Youth, when seems the Earth
A Summer-land for singing mirth,
When souls are glad, and hearts are light,
And not a shadow lurks in sight,
We do not know it, but there lies
Somewhere, veiled under evening skies,
A garden all must sometime see:
Gethsemane, Gethsemane—
Somewhere lies our Gethsemane.

With joyous steps we go our ways;
Love lends a halo to the days;
Light sorrows fall like clouds afar;
We laugh, and say how strong we are;
We hurry on, and hurrying, go
Close to the border-land of Wo,
That waits for you and waits for me:
Gethsemane, Gethsemane—
Forever waits Gethsemane.

Down shadowy lanes, across strange streams
Bridged over by our broken dreams,
Behind the misty caps of years,
Close to the great salt fount of tears,
The garden lies. Strive as you may,
You cannot miss it in your way,
All paths that have been, or shall be,
Pass somewhere through Gethsemane.

All those who journey, soon or late
Must pass within the garden's gate—
Must kneel alone in darkness there,
And battle with some fierce despair.
God pity those who cannot say,
"Not mine, but Thine": who only pray,
"Let this cup pass," and do not see
The *purpose* in Gethsemane:
Gethsemane, Gethsemane—
God help us through Gethsemane!

[*Chicago Times.*

JACOB'S VISION—CHRIST THE LADDER.

It is not often that we find the truths of the gospel so evenly balanced as in the following beautiful illustration from the pen of an eminent writer. His subject is Jacob's vision and vow and he has previously compared the ladder of the vision to the work of the Mediator, through which the lost communion may be renewed, and man again "have access to the Father," and has shown how the union of the Divine and human natures in Christ found an accurate emblem in this ladder—both resting on the ground, and reaching unto the sky; and he then proceeds to unfold the practical lesson which it teaches:—

"However we would avoid the straining a type, we own that the representation of Christ under the figure of a ladder appears to us to include the most exact references to the appointed mode of salvation. How do I look to be saved? By clinging to Christ. How do I expect to ascend up to heaven? By mounting, step by step, the whole hight of Christ's work, so that He is made unto me of God 'wisdom, and righteousness, and sanctification, and redemption.'

"It is no easy thing, the gaining eternal life through the finished work of the Mediator. It is a vast deal more than the sitting with the prophet in his car of fire, and being borne aloft without effort to an incorruptible inheritance. 'The kingdom of heaven suffereth violence, and the violent take it by force.' There must be, if we may thus express it, a holding fast to Christ, and a climbing up by Christ; to look back is to grow dizzy, to let go is to perish. And that we are to mount by the Mediator, and all the while to keep hold on the Mediator; that we are, in short, to ascend by successive stages, stretching the hand to one line after another in the work of the Redeemer, and planting the foot on one step after another in the covenant made with us and Christ,—what can more aptly exhibit this, than the exhibiting Christ as a ladder set upon the earth, that man may scale the heavens?

"The necessity of our own striving, and yet the uselessness of that striving, if not exerted in the right manner; the impossibility of our entering heaven except through Christ, and the equal impossibility of our entering it without effort and toil; the fearful peril of our relaxing for an instant our spiritual vigilance and earnestness, seeing that we hang as it were between earth and heaven, and may be thrown by a moment's carelessness headlong to the ground; the completeness and singleness of the salvation which is in Jesus, so that, if we adhere to it, it is sufficient, but there are no roads that meet in it or branch off from it—swerve a single inch and you have no footing, but must be hopelessly precipitated—all these particulars seem indicated under the image of a ladder, and could not perhaps have been equally marked, had some other emblem been given of the connecting of earth and heaven by the Mediator, Christ.

"And now, as I stand upon earth, the child of a fallen, and yet redeemed race, and examine how I may escape the heritage of shame which is naturally my portion, and soar to that sky which woos me by its brightness; oh, I read of 'entering into the holiest by the blood of Jesus,' and of 'laying hold upon the hope set before us,' and of following on to know the Lord, and of being 'raised up and being made to sit together in heavenly places in Christ.'"

Every minister's life should be a commentary upon Christ's life.

PERSONAL ITEMS.

Lord Dufferin will probably go to Asia Minor as British Commissioner.

Chace, the Fall River defaulter, takes his prison life easy. He is hammering iron hoops.

Lieutenant Gladstone, of the British navy, son of ex-Premier Gladstone, is in New York.

Ex-Senator Trumbull, of Illinois, does a large business at the bar of the Supreme Court.

A daughter of Colonel Mosby was elected Queen of Love and Beauty in Orkney, Va., last week. Miss Mosby's name is Mary.

Senator Bruce, of Mississippi will settle near Cleveland, Ohio, when his Senatorial term expires. He has purchased a farm there.

Miss Anna Dickinson will soon, with good health and energy, resume her literary labors in Philadelphia, and "go for" the scalps of some more "spotless" politicians.

Hon. J. Meredith Read, of the United States Legation in Greece, wants to stay there and do the work for nothing—the authorities having decided to abolish the office.

Paul De Cassagnac remarks that the treaty of Berlin was signed with the quills of four vultures, two geese and one pigeon. France, he admits, played the part of a goose.

Washington Irving's home at Sunnyside looks old and neglected. The decorations are all cheap, and pictures of the place so flatter it that the reality is in strong contrast.

Col. E. Z. C. Judson, formerly well known as "Ned Buntline," a sensational story writer, now lives quietly and happily at "Eagle's Nest," in Stamford, Delaware county.

King Alfonso proposes to erect a monument to his wife, the State voting $50,000 per annum toward building it until it is finished, the King giving $40,000 a year. It will cost $1,000,000.

Dom Pedro is getting to be more of a trump every day. Haydon Edwards, late Secretary of the Legation at Rio, says that the Emperor puts the United States twenty years ahead of Europe.

Michael Reese, who died recently at Wallenstein, Germany, leaves an estate worth about ten millions. With the exception of Senator Sharon, he was the largest real estate owner in San Francisco.

Bret Harte has arrived at Crefeld, Rhenish Prussia, and assumed his duties as United States Consul at that place. The town has a population of over 60,000, and is noted for its manufacture of silk goods.

A younger brother of the Earl of Beaconsfield has been discovered in the person of Mr. Ralph Disraeli, who is assistant clerk of Parliament—the second office of the House of Lords—with a salary of $9,000.

Mr. Jay Cooke, since his failure nearly five years ago, has been living with his son-in-law. He has grown old rapidly. His tall form and white hat can be seen almost daily on Third street, Philadelphia.

A marble bust of Charles Francis Adams by W. W. Story, and dated "Rome, 1878," was on Saturday placed on exhibition in Boston, and it is thought that even this bust will act as a refrigerator for the whole town.

Here is another New York inventor, Graham by name, who is experimenting on the phenomenon of the mirage, and believes that he can produce an instrument that "will photograph the deck of a ship 5,000 miles distant."

Mr. Burchard Hayes and his father, the President, have expressed themselves as greatly pleased with the federal weather reports. Burchard Hayes goes around a great deal at the expense of the United States, and his opinion is of vast importance.

Of the American notables abroad, Gen. Grant is on his way to St. Petersburg, Commissioner McCormick has returned from Scotland to Paris, General Meredith Read is doing the show, and General Davis has presented his Revolutionary relics of Lafayette and Rochambeau to the French government.

Of operatic stars—Adelina Patti is an American, Mlle. Minnie Hauck is an American, Mlle. Albani is a Canadian, Mlle. Thalberg is an American, Mme. Gerster Gardini is a Hungarian, Tremelli is a German, Trebelli is French, Gazarre is Spanish, Foli is Irish, Schoneroski is Austrian, Marie Roze is French, Mme. Nilsson is Swedish.

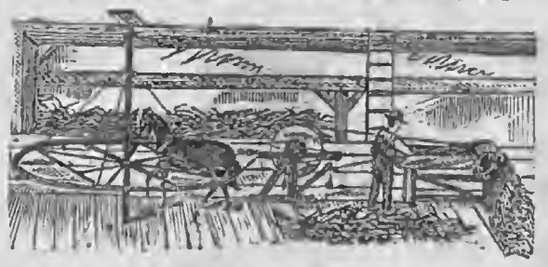
Ex-Premier Gladstone is six feet high, sallow, bony, square-cut and well defined. His eyes are somewhat merry-looking and brown; his forehead is receding, yet hard and square about the temples. In his costume Mr. Gladstone is loose. His shoes are big and never fit, his pantaloons are baggier than were Daniel Webster's. He wears but one glove, and seldom puts the other on, like Macauley.

Mr. F. J. Tandy, coin examiner at the Treasury in Washington, is, perhaps, the most notable expert in his *role* in the world. He will detect by the touch alone—being blindfolded at the time—a counterfeit coin in a heap of specie by simply running his hand through the same and bringing coin after coin in contact with his sensitive fingers, until he has touched them all. The fraudulent piece or pieces are sure to be detected.

Miss Braddon, the author of many sensational novels, is portrayed as stout, blowsy and prosaic-looking as any ale-wife in England. Romantic though her stories be, she is the incarnation of the unromantic in face and figure, and would never be suspected of the remotest connection with literature. Her conversation is said, however, to contradict her looks, for she talks very brightly, and has a pleasant, well-modulated voice, as so many of her countrywomen have.

Implements and Machinery.

Farmers' Cut Feed Stormy Days
WITH
ADAMS'S HORSE-POWERS.



When used on barn floor a 15 year old boy can set up, operate, and put it away alone. Occupies no useful room when not at work. Safest, most durable, most convenient and cheapest power made. Send for Circular. ☞ Responsible Agents Wanted.

Wit and Humor.

SARCASM.

I called one evening last autumn
  On a demoiselle "treseau;".
In conversation brave and gay
The time passed pleasantly away
  Till the hour had come to go.

Then a pensive mood came o'er me;
  I remarked with many a sigh,
"The frost and cold will soon be here,
The landscape changed to brown and sere,
  And all things green will die."

She looked sweet and sympathetic,
  And the tear stood in her eye,
As she murmured in a voice divine,
Placing her lily hand in mine,
  "I'm sorry, but—good-bye!"

We saw a young man with two heads on his shoulder the other day, but didn't consider it much of a curiosity. One belonged to his girl.

An American tourist was visiting Naples, and saw Vesuvius during an eruption. "Have you anything like that in the New World?" was the question of an Italian spectator. "No," replied Jonathan," but I guess we have a mill-dam that would put it out in five minutes!"

The other day, as two newly-arrived Irishmen were walking up Kearney street, a pavement trap-door opened and a Chinese store-porter emerged. "Be gorra!" said one of them, "if the haythens haven't got a tunnel clane thro' fram Chinee, bad luck to thim!"—*San Francisco News Letter.*

That celebrated orchestra, the Katti, have commenced their open-air concerts for the season. The attendance last evening was numerous, and the old favorites were well supported by many promising amateurs. The programme included selections from Bawlini's well-known master-piece, "Hear me, gnaw ma," and Holy Bull's sympathy, on ze flat. Several bootjacks were thrown.—*Com'l. Adv.*

Picnic Lemonade.—Here is a recipe for making picnic lemonade. First get your barrel. Then fill it with water. Don't be mean, but put in plenty of water. Now throw a pound of white sugar into the barrel. Squeeze in a large-sized lemon. Don't be mean about the lemon, either, but put the whole of it into the barrel. Stir with a long pole, and call the children up immediately. As fast as they drink, fill the barrel with cold water. The beverage thus made is cheap, and is quite healthy.

An enterprising editor in Germany got an idea of the sensational style in which some of our papers advertise their issues, and he tried it by sticking in his columns the mystic words "To-morrow afternoon." It was on the afternoon of the next day that the emperor was shot, and the luckless editor was arrested and had hard work to convince the authorities that he was all right. He is disgusted with the American system, and says he will put no more dings in his paper any more for so.—*Lowell Courier.*

A Hard Case.—Enter young husband, who throws himself into a chair, and exclaims: "What! toothache again, Maria! I do call that hard upon a feller! Why, you had toothache when I left this morning! And here have I been at Epsom all day, with the jolliest lot o' fellers ever got together in one drag, and won a pot o' money, and had no end of a jolly time, and I did think I should find something cheerful and jolly to greet a feller when I got home! And there you are!—toothache again! I do call it hard upon a feller—precious hard!"—*Punch.*

Things not so generally known as they ought to be—That the evening song of the nightingale is nice, but that the morning lay of the barn-door fowl is nicer. That the end of the longest wail is blubber. That ships are frequently put into stays, but they only wear barnacles when they go to sea. That some lovers' quarrels begin, and that many end, with a smack. That, although one swallow may not make a summer, yet an inverted tack on a chair will make one spring. That the real and only correct system of bookkeeping is—not to lend them. That it is very difficult to keep your own peace of mind if the wife of your bosom will insist on frequently giving you a piece of hers.

Serve an Injunction on Disease.

By invigorating a feeble constitution, renovating a debilitated physique, and enriching a thin and innutritious circulation with Hostetter's Stomach Bitters, the finest, the most highly sanctioned, and the most popular tonic and preventive in existence. It strengthens the stomach, remedies torpor of the liver and bowels, and gives a healthful impulse to the secretive and discharging functions of the kidneys and bladder. Not only does it arrest and prevent the recurrence of malarial fevers, but it furnishes the only adequate safeguard against them to persons who have never been afflicted with those maladies, but would be liable to incur them if medicinally unprotected. It eliminates from the blood certain impurities which the most skillful pathologists assign as the exciting causes of those agonizing complaints, rheumatism and gout, and it is, moreover, an excellent remedy for an enfeebled or overwrought state of the nerves and for mental despondency.

The Corn Crop.

Reports from Various Parts of The Entire Country up to the Hour of Going to Press.

THE FRUIT CROP.

OTHER CROPS.

RURAL SPECIAL REPORTS.

NEW YORK.

CRANE HILL, Madison Co., N. Y., Aug. 11.

CORN in this vicinity has not as large a growth as last year, but it seems to be bearing finely—many stalks having three ears, and if the season is favorable, I see no reason why we cannot harvest a good crop. Oats will be light; straw very short and badly down; this not so well headed. Potatoes must be light, for the early spring induced many to plant very early, so that many pieces were frozen down and some of them never started again: others started and were frozen once more, while some suffered a third time from frosts. The ravages of the bug have been severe, and rust has struck the vines more or less so that there must be a sharp corner in favor of potatoes or the crop must be light.

HAY was expected to be light on account of the frosts, but of late it has improved so that some claim a heavier crop than last year.

DAIRY PRODUCE the fore part of the season was heavy, but we are shrinking badly the last part, and as the Midland railroad runs through this vicinity, New York prices govern us pretty much exclusively.

APPLES are not as plentiful in this vicinity this year as last, but yet there seems to be enough for home consumption.

THE WEATHER has been so wet for the last two weeks that not more than four days have been without rain, consequently hay and grain are not yet all secured, although both are getting over-ripe. About the middle of the afternoon on the 8th instant, we experienced here a heavy storm of rain, the singularity of which was that it came up in the northwest and most of it went south, then east, then north, then west, until it arrived at the point from which it started. But its fury was not yet spent, so it followed its first path until it got into the northeast, where it seemed to lull after making one whole circuit of the compass and three-fourths of another. The first circuit was accompanied with lightening, and nearly every flash was a chain, which came directly earthward, striking different objects quite frequently but doing no damage. Now the question is, why the shower traveled as it did, and why the lightening flashes were all perpendicular instead of being horizontal as in common showers. L. P. N.

DOE RUN, Chester Co., Pa., Aug. 13th, 1878.

THE corn crop in this and adjacent counties will not be equal to last year's crop, and I think, will be below an average. During a trip of 30 miles, last week, I noticed a few pretty good fields of corn, and many quite thin and light. The spring was cool and corn made very little progress till some time in June. Farmers worked their corn reasonably well while young and small, but harvest coming on rather early, and the hay and wheat crops being pretty heavy, by the time these were gathered the oat crop was ready, so that by the time this was in, the corn was then too old or forward to work. Some few who would have worked their corn in harvest, found it somewhat blown down just at that time by a rain-storm. As but little corn therefore got worked any after it was a foot or so high, it is evident the crop is much lighter than it would have been with additional cultivation. There was also much complaint of an insect working at the root or of some other unknown enemy, as some fields were very uneven in growth, stalks not over a foot high, yellow and "doucy-looking," while the next hill in the same row would be well up and in tassel.

As to fruit, the trees of many varieties of apples are full. There will be a much better crop than we had last year, but it will not be equal to that of the year before last. Peaches are doing but little good in this county; they rotted and fell off. The orchards I am acquainted with will not produce over a fourth as many peaches as last season. Apples below an average. Peaches not half a crop. Blackberries abundant. Pears an average. Grapes a full crop. T. W.

CLYDE, Wayne Co., N. Y., Aug. 12, 1878.

THE prospects of corn crop is good from the southern line of Wayne County to the lake. Though corn suffered from 10 to 15 days' severe drought—the leaves rolling badly, in July, in the southern tier of towns—yet there are no very poor pieces. The northern part of the county did not suffer, and as a whole the crop will be an extra good one. The best, 125 bushels of ears per acre, probably.

Notwithstanding the severe attacks of the Fly upon Clawson wheat, it is reported to be yielding well, many pieces turning all along between 30 and 40 bushels per acre, the Lancaster not reaching it, though unattacked. By sowing one bbl. of second-grade salt to the acre, the depredations of the Fly will be prevented, and the fertilizing results are exceedingly satisfactory. This grade of salt comes at 80c. or 90c. per bbl. Many acres of barley are destroyed by the Fly, some pieces which were better than the worst were raked up with horse rake without cutting with a scythe or machine, as the Hessian had so nearly cut it off that it would break. Wheat $1.10; barley $1.10, both rising. Rich extra-tilled pieces of barley turned largely. Oats good. The Norways and black varieties are again turning out the best, the Probiestier and white kinds of oats being behind in yield.

Apples abundant all over the county; peaches very plentiful in northern and lake towns of county; in southern towns none. Short crop of grapes, probably from extra yield last year. Little clover seed, very early. It is nearly ripe in some fields, but few acres in county. The yield will be good. W. L. D.

BELMONT, Allegany Co., N. Y., Aug. 12, 1878.

IN our valley, corn is exceptionally fine. Generally planted from May 20th to June 1st, the warm weather, with plenteous and frequent rains, gave it a rapid growth, and, from present appearances, it will be above the average. I think also that this is equally true with regard to this crop generally throughout the county. There was a larger acreage of wheat than usual, and it generally stood well on the ground, looked very promising from early spring throughout the season, and was harvested in good condition; but the general testimony of farmers is that we shall be disappointed in the yield—that the average will not be over 20 bushels, and probably under that. The midge injured it some in this locality, and more, as I am advised, in the other portions of the county. The oat crop is thought to be above the average. Barley, though formerly cultivated considerably, was this year generally left out. An unusually large quantity of potatoes was planted, with the expectation and prospect of a large yield; but we have *all* discovered recently that on this crop we have bestowed much labor to little profit. The vines, about two weeks ago, began to decay, and showed evident signs of disease—looked as though a fire had scorched them. On examination, I found my Extra-early Vermonts not fully grown, many of the vines entirely dead, many of the tubers having on them a white substance like mold, and some of them well started with soft spots. Brownell's Beauty seems so far to have escaped.

Apples and pears, in the valley, are nearly an entire failure—the result of that nipper of a frost on the morning of the 6th of June. Cherries, for the same reason, were nearly a failure. But on the uplands, all along the valley, there is a fair apple crop. H. A. P.

MARTINSBURG, Lewis Co., N. Y., Aug. 12.

ALTHOUGH this is not strictly a corn-growing section, yet the crop bids fair to be more than an average one. In fact, it is good for this locality. The hay crop, like that of last year, is superior, but few farmers finding their barns sufficiently large to hold the yield. Grain, generally, is a good growth, but I fear the recent rains have done great damage, and much that is cut and not gathered, and that is ready to cut will be greatly injured. The potato crop is, I think, a very poor one, as I see many pieces not worth the harvesting.

Apples are much more plentiful and better than last year, although the ground under some of the trees is pretty well covered with "wormy" fruit that has fallen off.

The great rain on the morning of the 9th has done much damage to almost everything unharvested. Direct individual losses, too, are considerable, but not so great probably as in many sections. All around us we hear of mills being swept away, barns struck by lightning and consumed, telegraph poles shattered, the low-lands flooded, and all are agreed that for rain, lightning and thunder-storms, this season is one to be remembered, M. N.

BEDFORD STATION, Westchester Co., N. Y., Aug. 12, 1878.

CORN doing finely. I have by a ride through the country seen many fine fields. Some of them average two ears to the stalk. Fodder corn excellent. Rye has turned out very well, but has been somewhat damaged by heavy rains which caused it to lay over badly, thus making bad cutting. Wheat, which in this section is raised only for home use, has turned out middling. The oats have yielded very heavy returns, yielding 45 to 50 bushels to the acre. The experience of a man who has seen crops in Europe, is that he has never seen the like. Hay very good The potato crop will, to all appearances, be a failure, the early ones dying off without any apparent cause, the late sorts are doing somewhat better. The bugs are not so thick as they were last year, a small insect has appeared which feeds upon the eggs.

Apple and pear trees were greatly damaged while in blossom, by the May frost in all low-lying places. On high land the frost affected the trees somewhat, nevertheless the yield has been exceptionally large. W. S.

WOLLKILL, Orange Co., N. Y., Aug. 12.

THE corn crop in this section has the appearance of turning out well, but there is very little corn or other grain raised in Orange Co. many farmers raise none, and the majority but a small proportion of what they consume. Making milk for the New York market is the specialty of Orange Co. farmers, and they purchase a great many car-loads of corn and other grain from the West. Probably not over three acres to the one hundred are planted with corn.

Farmers quite generally speak of the wheat being cut off by the Hessian Fly, and there will probably be less than usual put in this fall. Hay has been a very good crop, particularly on newly-seeded ground. The apple crop will be light so far as seen or heard from. The earth has been well watered here this season, and every thing is in a flourishing condition. T. A. M.

JAMESTOWN, Chautauqua Co., N. Y. Aug., 12.

THE corn crop in Chautauqua Co., although very backward in the early part of the season, is now looking well and will, I think, be a full average unless we have very early frosts. The hay crop is secured in fair condition, although the weather has been very unfavorable. The yield is above the average. Winter wheat, of which there was a large breadth sown, is the best it has been for many years. Spring wheat nearly a failure. Oats a medium crop. The long-continued rains in the spring drowned out a good many and the recent storms have lodged them badly. Of barley but little is sown in this section, a good average crop. Potatoes will be an extremely light crop. They were frozen down in the spring and many fields are a very poor stand; vines are small and they have already commenced dying. Apples a light crop. Many orchards that promised well, early in the season, are now nearly bare of fruit. The crop in this county, I think, will be far below the average. W. C. G.

BURNT HILLS, Saratoga Co., N. Y., Aug. 12.

THE prospect of the corn crop in this section at present is not very good. In July it was growing very finely, but the excessive rains of the past two or three weeks have injured it very much. I think at present that corn will be hardly an average crop. Oats not as good as last year, and very much damaged in harvesting by heavy rains. Early potatoes are turning out poorly—about half a crop; but few late ones planted. The prospect for apples is good at present; the trees are now quite full, but a great many wormy ones are dropping off; early ones are very plentiful now. The crop in this section will not be as large as two years ago. Pears are not abundant—not an average crop. Plums about an average crop. J. H. T.

GARRATSVILLE, Otsego Co., N. Y., Aug. 13.

CORN was planted earlier than usual in this section, but on account of cold weather was very backward until the hot days of July came, when it pushed forward rapidly, and, unless we have an early frost, it will be fully an average crop. Mixed farming is the rule here, nearly every farmer raising a little of each variety of crop, and depending principally on dairying as the backbone of his business. Fruit, the small fruits in particular, will not be as plentiful as last season; apples about the same on hill farms; they were injured by frost to some extent on streams. Hay was a very heavy crop; all other crops good except potatoes, which are likely to be a poor crop. C. B.

NUNDA, Livingston Co., July 11, 1878.

THE corn crop in the low-lands or valleys, has a good growth; but I fear it will be rather late. Winter wheat is a very heavy crop around here, although those that have thrashed say it does not yield very well from the straw. Oats and barley middling, not much of the latter sowed around here. The apple crop will not be very heavy; summer fruits were nearly all destroyed by the frost. This has been a very rainy summer, and we have had a terrible time getting in our spring crops and late hay harvest. Wages were from $1.50 to $2.50. G. B.

CLINTON, Oneida Co., N. Y., Aug. 10, 1878.

THE prospect of the corn crop is quite good; but it is a little backward in maturing, owing to the cool weather at the beginning of the season. The hay crop has been very abundant. Oats very heavy. Wheat and barley fair. Winter wheat better than an average crop. Continuous wet weather of late has interfered very seriously with harvest work. Potatoes are small, and the yield will be very light. Apples, about an average supply. The yield of pears will be light. Plums and cherries were almost an entire failure. L. B.

NAPLES, Ont. Co., N. Y., Aug. 10, 1878.

THE corn crop in this section is the best I ever saw at this time of the year. Putting the average, during a series of years at 100, this year it is 120, at least, and it is the same with all farm products; but some little of the hay and grain has been gathered in bad order on account of the hot weather. The fruit crop is light; the frost killed it on the high lands, but the valleys

have an average crop. The grape crop in Naples Valley is light, but enough unless the price is better than it has been for three years past.

J. C.

JOHNSON'S, Orange Co., N. Y., Aug. 12.

THE prospect is good for a fine corn crop if the Fall proves favorable. The stand is generally good, and the acreage about as large as usual in this vicinity, which is not very heavy, as we run mostly to grass. Potatoes are rather a light crop. Oats are not as good as expected, but very fair. Wheat was rather a failure owing to the Fly, some not being harvested. Rye good. The apple crop is good; some peaches where the trees are healthy; plums but few owing to early frosts. The hay crop is fine, and got in fine condition; fall pasture is looking well. Buckwheat has started finely. H. R. H.

NORTH LANSING, Tompkins Co., N. Y., Aug. 12.

THE prospect in this vicinity for corn is very good; although we are passing through a severe drought, there is a large growth of stalks well set with ears. Should we have rain soon, we shall harvest a large crop. Wheat is a bountiful yield, and secured in good condition. Oats rather light. Potatoes suffering greatly by drought, consequently small. Apples early, a fair crop; winter, with the exception of Russetts, not half a crop—indeed, very many orchards have but few. Peaches more than an average crop. Small fruits have not been very plenty.

H. S.

OPEN MEADOWS, Chautauqua Co., N. Y., Aug. 12.

FARMERS in this section are through haying, and the hay crop is better than in a number of years past. Wheat never better, and is all in the barns. Oats are being harvested and looking fine Potatoes are not as good as last year; neither is the apple crop, but the yield is enough for home use with some to spare. The corn crop is looking fine, considering the late spring, and if the frost holds off, there will be a fair crop yet. Taken altogether, the crop is fine.

M. L. D.

EAST HORNSFIELD, Jefferson Co., N. Y., Aug. 12, 1878.

THE present indications in regard to the corn crop, are that we shall have fully an average yield. Early potatoes are nearly a failure. The yield of late potatoes, I think, will be small. Early in the season wheat, oats, and barley looked very promising; but, owing to a severe drought in July, the yield will be no more than an average one, more or less damaged in harvesting by the continued wet weather. The apple crop will be smaller than usual. L. F. A.

SPERDWELL, Tompkins Co., N. Y., Aug. 13.

FINE weather so far this week, but for two weeks past have had a great deal of rain, which has put the farmers back. There are a great many acres of hay to be cut yet. Harvesting will be nearly done this week. Oats are very good, and so is winter wheat; spring wheat not up to last year's crop. Corn is looking splendid. About half a crop of potatoes. Small fruits are plenty, but not so apples. L. C. L.

POUGHKEEPSIE, Dutchess Co., Aug. 14.

CORN in Dutchess Co. came up very unevenly, owing to frost and cold, wet weather. On low lands it will be rather above the average; not so good on the higher portions of the County. Apples quite a full crop—not equal to yield of '74; hardly up to that of '76. Wheat, rye and oats were unusually fine, and hay abundant. Finest weather for growing crops within my recollection. W. H. H.

LOWVILLE, Lewis Co., N. Y., Aug. 13.

Rainy the most of the time; for two weeks we have had rain every day except three days. There is a great deal of hay to make yet. Winter wheat is good, coarse grain; oats and barley, not good crops—too dry to fill well, and now it is so wet that it is almost impossible to harvest it in good shape. Corn good. Apples half a crop. Potatoes poor. Hops are looking good, and bid fair. Cheese seven cents. M. B.

BRANT, Erie Co., N. Y., Aug. 11, 1878.

THE corn crop in this section I think will be fully an average one; throughout the county it will be considerably below—Potatoes not a third of a crop from appearances now. Wheat damaged by the Fly, but we are getting a fair yield—selling for $1.05 at mills. Oats below an average crop; grass extra good, secured in very good order. R. E.

FLUVANNA, Chautauqua Co., N. Y., Aug. 12.

The corn crop in this section is very promising, I think far above an average. The fruit crop is very little this season in this county, not one-fourth of a crop of apples. The prospect is that the potato crop will be very small in this section from being rusty, and potato tops are dying before the tubers have matured. J. S.

LIVINGSTON Co., N. Y., Aug. 10, 1878.

THE corn crop bids fair to be extra good this season. Winter wheat and oats are also extra good. Spring wheat is not filling well. Barley is a fair crop. Fruit of all kinds is scarce. Hay is abundant. There is a good deal of complaint about potatoes not yielding well, being small, and some rotting, also. J. A. S.

SHERMAN, Chautauqua, Co., N. Y., Aug. 13, 1878.

THE hay crop in this section is larger than it has been in many years. Grain crops are quite good. Potatoes will, doubtless, be scarce this fall, and will, no doubt, bring good prices. Apples are also a very small crop. Blackberries plenty. Corn is a fine growing condition.

M. L. D.

WALDEN, Orange Co., Aug. 12.

WE are glad to state that the prospect of the corn crop, for a large yield, is unusually good. We are having warm, showery weather, and unless an early frost should come, our farmers will have reason to feel thankful for abundant crops. Would judge that about the average amount of ground was planted this season. W. C. H.

TOWANDA, Cattaraugus Co., N. Y., Aug. 13.

THE corn crop is very good; more than half of it is glazed, so that it will be out of the way of frost this season in our section of the country. The fruit crop will be very light in our place. The hay crop is very heavy—never better. The oat crop is good, and pastures never better.

E. F.

MIDDLETOWN, Orange Co., Aug. 10, 1878.

THERE is a larger acreage of corn planted than common. It is looking very fine. All it needs is hot weather to ripen it. Hay and oats were above an average crop. Wheat is below the average. Apples are small, but about a medium crop. W. B. B.

ONEIDA, Madison Co., N. Y., Aug. 15, 1878.

CORN is looking well, and it is thought now will be more than an average. Grain, already harvested, is generally light. Hay crop was large and good. Potatoes few and small—especially those planted early. Fruit prospects are good. J. S. H.

WALES, Erie Co., N. Y., Aug. 14.

Crops are good; hay never better; oats, rye and barley, fair. Corn is looking finely; wheat was injured some by the rust. Fruit nearly all destroyed by the frost. Pastures are fresh. Plenty of rain through the season. S. W. H.

GENEVA, Ontario Co., N. Y., Aug. 10, 1878.

So far as observed the corn crop promises well hereabouts; though late in making a start, it seems to have made up for lost time. West of Geneva some damage has been done by hail and heavy storms. W. H. C.

CHEEKTOWAGA, Erie Co., N. Y., Aug. 13, 1878.

THE corn crop in this section, as far as my observation extends, is about an average one. Oats not an average; barley light and poor; wheat very good; and there is also a very large crop of hay. G. B. E.

SCHENEVUS, Otsego Co., N. Y., Aug. 14.

THE corn crop in this section will be fair. The hay crop is large. Rye very heavy. Early-planted potatoes will be a light crop; late-planted fair. we had plenty of potato bugs, but Paris-green fixed them. Fruit plenty. J. F. C.

CANESARAGA, Allegany Co., N. Y., Aug. 12.

THE corn crop, as far as we know, will hardly be an average one. Wheat—that is winter wheat—is a heavy crop, but fruit is a failure on account of the freeze in June. E. S. B.

MEDINA, Orleans Co., N. Y., Aug. 10.

THE corn crop is above the average, and so is wheat. The barley and oat crops are considerably below an average, and so will fruit be.

H. L. F.

NORTH BLOOMFIELD, Ontario Co., Aug. 12.

ALL farm crops are good in this section, the corn crop in particular. Fruit rather light.

A. G.

NEW JERSEY.

NEWTON, Sussex Co., N. J., Aug. 12., 1878.

THE corn crop this year is looking first-class—a great deal better than last season. We have had plenty of rain in this section, and I think that the crops will be a great deal better than the prices, this fall. Millet is doing extraordinarily well this year; last year it was hardly worth gathering. Apples are plentiful, and milk is very low, one cent per quart at the Brighton Creamery. Flour is at all prices, to suit the times—from $2 50 up to $6 and $7 per cwt. A man can live on apple dumplings, if the times are a little tough. My father-in-law has the best lot of corn, oats, wheat and apples of any one in the two counties of Sussex and Warren. They are splendid. He takes care of his manure and knows how to use it. It is the main part of successful farming to have a good captain at the head of it. Potatoes, I am afraid, are going to come out small this season. It has been almost too wet for them to turn out well. Pasture holds on well and the cows and stock of all kinds look excellent. Butter is way down so low that a man ought to be hung that will let his feet get sore on the account of hard boots or shoes, or let his horse sweat with dry wagon wheels and hard harness. A. V.

MENDHAM, Morris Co., N. J., Aug. 9, 1878.

THE prospect for an average yield of corn in this and adjoining townships, is good. Hay crop excellent. Wheat less than half a crop, injured by insect. Potatoes promise an average yield. Fruit a partial failure except apples, of which there will be two-thirds of a crop. Peaches are very scarce, and what few there are, rot badly. Oats a full crop. S.

ROSELLE, Union Co., N. J., Aug. 10, 1878.

OUR corn crop is good and more has been planted than usual. Our hay crop was very good, but it is worth only some $7 or $8 per ton. Oats are fine and apples look promising. Pear-trees are badly blighted and small fruit was generally injured by the frost. J. R.

PENNSYLVANIA.

OSWAYO, Potter Co., Pa., Aug. 11, 1878.

CORN hereabouts will be nearly a failure, owing to a superabundance of rain. There is but little planted in this section. Wheat will be about half a crop. Winter grain does not bid as fair as the spring grains. Oats are the best crop in this immediate vicinity. Potatoes will not amount to much; the prospect now is that they are going to rot a good deal. Hay is a drug; everybody has more than he knows what to do with. Plenty of old hay in the country and the new crop is as good as we have had in several years. The fruit was nearly all killed by the frosts we had the last of May.

This is a new county; people have been engaged in the lumber trade till within a few years; consequently there is not as much farming here as in the adjoining counties in N. Y.

S. L. M.

CHATASAUQUA, Lehigh Co., Pa., Aug. 12, 1878.

THE corn crop throughout the whole county never was better. It would delight you to take a ride through this section of Lehigh County. A great many old people say that for many years back they have not seen such a crop. Potatoes are also a good crop. Apples are poor around here. Grapes look well, especially my own, which suffered not at all from the frost. A great many of the farmers' barns are full, and you will see all around stack-yards of rye and oats. We have here a greenhouse containing about 2,000 plants, large and small. We have also about 200 chickens, which we raise ourselves. There are a great many varieties of grapes also, and about 400 roses, our "boss" rose being the Marechal Niel. C. M'C L.

GREENVILLE, Mercer Co., Pa., Aug. 12, 1878.

THE corn crop in this vicinity is going to be a *good* crop, much better than was expected; the rains brought it up finely. The peach crop is not an average one; apples will be plentiful; potatoes are a failure on account of dry weather.

J. L.

OHIO.

KENSINGTON, Columbia Co., Ohio, Aug. 12 1878.

THE corn crop of Columbiana and Carroll counties promises less than an average—as far as my observation and information extend—say 10 to 20 per cent less—though abundant showers and warm weather during this month and the first half of next, will have much to do with it. The whole month of June was very cold and wet, and corn did little good. Then harvest came with such a rush that many fields have been sadly neglected. My corn—with two good workings during harvest—will be very good. If the cold, wet, month of June held back the corn—it probably made it up in grass—a greater abundance of pasture was never seen, and a better hay crop, better secured, never harvested in this locality. Oat crop great—both in yield and area sown. Wheat, above an average, though some fields were injured by Fly and some late wheat by the hot weather.

This section of country is abundantly provided with barns for all ordinary seasons, but this year there is scarcely a farm on which there are not one or more stacks of hay or grain besides what filled the barns.

Fruit abundant, except on some farms in valleys, on which the fruit was killed about the 15th. of May. Fruit is not made a specialty by any one in this locality, but quite a quantity of peaches and apples are often shipped from here. The peach trade has just opened; Hale's Early, the principal early variety, is proving very unsatisfactory on account of rot.

Farmers generally are waking up to the fact that it pays to keep good stock, that a sheep that shears six lbs, is no more expensive than one that shears four. Still, some do not yet realize that any stock, to do well, must be properly cared for. D. J. P.

NEW WAY, Licking Co., O., Aug. 13th, '78.

CORN never looked better. In dangor, when shooting, from dry weather; timely rain savedit; ears well set; prospect better than last year. Wheat and oats are being threshed, amount and quality exceed expectations. This vicinity has rather too much heavy clay for wheat, wants draining, but is averaging, I think, 18 or 20 bushels per acre. One field of six acres threshed 120 bushels, highest estimate 90 bushels. Oats I think are averaging 40 bushels per acre or more, and heavy berry. Hay crop heaviest for years. Blackberries rotting, so plentiful. Peaches and apples abundant. Persons out of debt happy—can eat, drink and be merry.

S. S. W.

GAMBIER, Knox Co., Ohio, Aug. 13, 1878

CORN in our county now gives promise of a very fine crop, especially on the bottom lands. Upland crops may be a little light. We have the best crop of wheat that was ever known here. Oats, too, are very good. Of fruits we have the greatest abundance—an enormous crop of apples selling for 20 cents a bushel, and plenty of peaches just coming into market. More attention is given here to raising hogs than cattle. Stock hogs are not very plenty. We have some cholera amongst them; I have lost 50 head on my own farm this summer. J. T.

ROCKDALE, Warren Co., Ohio, Aug. 14, 1878.

CORN grew very slowly during the month of June—looked very discouraging, indeed; but with the hot weather of July and frequent showers of rain, the corn grew astonishingly rapid, and now it is all in tassel, with a good deal of it fit for roasting-ears. With the exception of perhaps one-tenth which will not ear from having been affected at the root by an in insect, we will have an average crop. There is a larger acreage planted than last year. The most of it is very tall, 10 and 12 feet: C. L.

SPRINGBURG, Warren Co., O., Aug. 12, 1878.

THE present prospect indicates an average crop of corn. Wheat good but not turning out as heavy as expected before threshing began. Barley not as many acres as usual and damaged by frost. Oats good. Apples near an average crop; Pears plentiful; Peaches scarce. Potatoes generally poor. W. H. C.

DOYLESTOWN, Wayne Co., O., Aug. 12,

CORN hereabouts is poor, it being too wet at the time of planting. Wheat is turning out well; it will be above an average crop. Oats and rye are good. Hay is plenty. Prospects for late potatoes are good, early ones poor. Fruits of all kinds are plentiful especially apples and peaches. F. C.

NEW CONCORD, Muskingum Co., Ohio, Aug. 12.

THE prospects for an abundant corn crop are not flattering, owing to the dry weather we have been having for the last two weeks; but if we have rain soon we may have a fair crop. Wheat and oats were good and are yielding well. Fruit of all kinds is abundant, but the early peaches are rotting badly. J. C. P.

URBICNSVILLE, Tuscarawas Co., Ohio, Aug. 10.

THE prospect now is that we shall have a good crop of corn in this county. Wheat and oats above an average crop; hay a good average, and all well saved. We have had an abundance of small fruit; there is a very heavy crop of apples and peaches; also of plums. In fact, we have a good crop of everything. F. B. H.

SALEM, Columbiana Co., Ohio, Aug. 13.

WE have had fine growing weather. Corn is looking well. Wheat, oats, and rye good. Oats averaged 60 bushels per acre. Apples and peaches will be a good turn-out. Pears a light crop. Plum trees are very full.

M. E. T.

PAULDING, Paulding Co., O., Aug. 13, 1878.

CORN is not very good in northwestern Ohio, owing to the heavy July rains. Will make two-thirds of an average crop. Fruit prospects good; apples in abundance; no end to blackberries; some peaches. F. B. D.

MICHIGAN.

ADRIAN, Lenawee Co., Mich., July 12.

CORN never looked better, and, if not injured by frost, will be the largest crop we have ever had. The wheat crop is the largest in the history of the county. Hay was also good. The farmers have had a remarkably favorable season for gathering their crops. One man told me he had 40 tons of timothy from 13 acres, all secured without a drop of rain on it. And that is the experience of hundreds of others. There is abundance of everything to eat at very low prices. White winter wheat, best quality, $1.00; No. 2 white 93c.; amber 93c; No. 2 amber 86c.; white oats 26c.; mixed 23c.; Early Rose potatoes 30 to 40c.; onions 75c. per bush.; fat cattle (steers) two to four years old $3 to $3. 50 and $4 per hundred pounds live-weight; timothy hay $6; butter, best quality, 10c.; eggs 7 to 8c.; cheese 7 to 7½c.; good wool 30c.; fall apples per bush. 25c., with good prospects of large crop of winter. Wheat will average from 20 to 25 bush. per acre, and be of good quality. A. W.

TECUMSEH, Lenawee Co., Mich., Aug. 12.

I HAVE lived in this State over 40 years and I think I never have seen better crops. In general wheat is already harvested. Some is a little shrunk, but, on the whole, it is more than an average yield and quality. One farmer told me that he had just threshed 2,200 bushels cut on less than 100 acres, 22 to 25 bushels per acre being about the average yield. All spring crops, oats, corn, potatoes, &c., never looked better at this season of the year. Fruit of all kinds is abundant in quantity and first-class in quality. I am speaking of this section in particular, but I have daily news from all parts of the State, and I unhesitatingly say that crops in general were never better. Wheat is worth now with us from 95 cents to $1.10, according to quality and color.

E. R. H.

PLYMOUTH, Wayne Co., Michigan, Aug. 13.

WITH regard to the corn crop hereabouts, on the low and heavy land the continued heavy showers—almost unprecedented in quantity per hour—did considerable damage; in many cases leaving the ground perfectly bare; but, on the average, a fair crop is expected, if the frost holds off long enough for it to mature, the most of it being planted a week or ten days later than usual.

J. H. J.

MUSKEGON, Muskegon Co., Mich., Aug. 13, '78.

THE wheat and grass crops here were above the average of seasons. Corn and late potatoes promise well to extra. Early potatoes very light on sandy land. All tree fruits bearing none or very little, except on the highest ground or where fogs prevented the frost of early May. Strawberries about one-third of a crop from the same cause. Wild berries in excess.

S. B. P.

MARSHALL, Calhoun Co., Mich., Aug. 13th.

THE corn crop never looked finer than it does at the present, but unless we have rain in a short time, it will shorten the crop tremendously. Wheat, an extraordinary yield and good. It is the largest yield Calhoun County has ever made. There is also a large and good crop of barley, oats and rye. Fruit is short. Potatoes a small yield for the want of rain.

D. H.

ILLINOIS.

WEST JERSEY, Stark Co., Ill., Aug. 13 1878.

RIGHT through this section of country the corn is good; but on flat lands, where there was poor drainage, the corn is considerably damaged, on account of the wet weather we had in corn planting time. Through this country corn will average a good crop, the same may be said of small grain. The hay was very heavy and was mostly harvested in good condition. People coming in here from different parts of the State say that corn is better here than in other sections of the country. A great deal of damage has been done to crops by the severe wind and hail storms that have passed throughout different portions of the State. There has been an abundance of small fruit, of all kinds. Apples are plenty but not as large a crop as we have some years. Peaches and pears are never a very large yield with us; but this year the yield is very fair. Early potatoes were not as good a yield as might have been, had we had more rain during the latter part of July.

H. E. M'C.

OTTAWA, Ottawa Co., Ill., Aug. 12, 1878.

CORN will be about 9 per cent. of the average crop of No. 1 quality unless early frosts cut it off. Spring unfavorable, heavy rains preventing low-land from being worked. Wheat saved; average, 18 bushels; sound, slightly shrunk. Oats, good above average. Little or no rye or barley raised here. This is not much of a county for apples or peaches; for, though almost every farmer has a small orchard, there is little fruit of this kind sold, it being mostly used at home. Small fruit does well, and the crop this year was fair and disposed of at paying prices. In my own garden, I have some twenty apple trees that yielded about two-thirds of a crop. The queer thing to me is that every year heretofore, from half to two-thirds would be wormy, whereas this year, so far, I have not seen a wormy apple. Season from Early Harvest to Golden Russet.

C. A. L. W.

PITTSFIELD, Pike Co., Illinois, Aug. 12.

CORN in this section of the county is about an average crop. Apple crop less than half. Peach, pear and quince crops very good; small fruits have been abundant—never better. A good crop of wheat, oats and hay. General prospects good.

M. R. P.

PITTSFIELD, Pike Co., Ill., Aug. 13, 1878.

THE corn crop in this section of the county, to all appearance, will be considerably below an average—probably a good two-third crop.

M. J.

INDIANA.

WILLIAMSBURG, Wayne Co., Indiana, Aug. 14.

WHEAT principally threshed and made a good yield, averaging 15 to 18 bushels per acre. Oats and flax good, and yielding well. Corn prospect good, but a week to ten days later than common. Apples badly blown off by heavy winds, the crop being below an average. Potatoes are small and only a moderate yield. Cabbage-worms are ruining the cabbage. Pastures are in need of rain in this immediate section. Health generally good. Times *said* to be hard, but if a show, such as P. T. Barnum's humbug, comes along, thousands can find time and money to spend.

W. M. H.

SOUTH BEND, St. Joseph Co., Aug. 15, 1878.

THE prospects for corn are exceedingly favorable in fact were never better. Fruit promises full return.

J. F. S.

IOWA.

COLESBURG, Delaware Co., Iowa, Aug. 10.

THE prospect for corn is the best that we have ever had. It is earing very large, and the warm weather has made a very large growth. Spring wheat is about fifty per cent. below the average. Fall wheat is about as good as or better than usual—will average about twenty-five bushels to the acre. The Poland wheat, a new variety, has done remarkably well. It will be the principal variety sown this fall. Oats have rusted badly—will be about twenty per cent. below the average. Hay is very heavy, and has been saved in good condition.

W. J. O.

MANCHESTER, Delaware Co., Iowa, Aug. 12.

THE weather, the past week, has been clear, bright, warm and drying. The prospect for corn is good, better than at this time last year. The chinch-bugs are troubling some pieces. Old corn is worth but 20 cents per bushel.

C. J. B.

LYONS, Clinton Co., Iowa, Aug. 12, 1878.

THE acreage of corn, in our section, is less by fifteen to twenty per cent. than last year. It is thought, however, that as the corn is heavy, the yield will be equal to the crop of 1877.

M. G. R.

KANSAS.

WILSON, Ellsworth Co. Kansas, Aug. 13.

In regard to the corn, I must say we have an unprecedented crop. Even "sod" corn, which usually produces but 15 or 20 bushels of "nubbins" will this year bring from 45 to 60 bushel to the acre, of as good corn as can be grown on old ground. Old-ground corn will produce from 85 to 120 bushel. Two-thirds of the corn grown in this county stands from 15 to 17 feet high. Corn sells for 35 cents per bushel.

In regard to the fruit, I must say, that fruit is scarce as yet, the county being but recently settled up, but what we do have, is as fine as the finest I ever saw in the New York markets. Peaches, apricots, quinces, grapes, currants, straw, black, and gooseberries, as well as plums, which grow wild, are in great profusion, and of immense size. In fact, the plums in this county are not cultivated, for the reason that they grow larger, and have a finer flavor than the cultivated plums of the Atlantic States.

Garden vegetables are of mammoth proportions, and grow with little care; we have squashes 2½ feet in diameter; watermelons 3 feet long; cucumbers, radishes, turnips, carrots, muskmelons, tomatoes, and all truck, grow in the greatest profusion.

O. L. S.

ROCKFORD, Floyd Co., Iowa, Aug. 13.

The prospect for an abundant corn crop was never better. Should no severe frost occur at an earlier date than usual, it will be the heaviest for years, good, we think, for 75 bushel per acre. The wheat crop is almost a total failure, yield per acre from 4 to 8 bushels, of very inferior quality. Had the hot spell begun one week later, it would have been immense. Oats are good. The apple crop is large for this section of country. No other except the smaller fruits are raised here, to any extent.

W. L. MC'E.

WHITING, Jackson Co., Ks., Aug. 12.

Crop report for this section good, except oats, which were a partial failure, on account of rust. Corn, A. No. 1; wheat good in quality and yield. Small fruits abundant. Apples and peaches a good average. Corn is worth 22 cents; wheat, 70 cents; oats, 12½ cents; cattle and hogs, $2,50 to $3,00 each; butter 10 cents. Hay crop good. Just rain enough to insure a great yield of corn.

J. W.

AXTELL, Marshall Co., Kansas, Aug. 13.

In regard to the corn crop, it is hard to find words to describe it. It is the best I ever saw in this or any other State. The fall wheat was good, as were the oats; but the spring wheat was badly injured by the chinch bug.

A. H. W.

July 28, 1878.

HARLAN COUNTY, Neb., is gathering a heavy crop. Immigration is large. The rainfall has been seasonable. Green corn and ripe melons are on the bill of fare.

R. H. C.

EASTERN STATES.

MANCHESTER DEPOT, Bennington Co., Vt. Aug. 12.

THE corn crop in this section is very backward, owing to the frost on the 6th of June, which cut most of it to the ground. By looking in my diary, I find the following at that date:—"Severe frost; ice formed half an inch thick." The crop will be light unless we have an uncommonly favorable autumn. The hay crop is mostly secured, and is about an average. From what we have observed, it is our opinion that potatoes will be scarce in this vicinity. The Colorado beetle is doing his share of the work of destruction.

In most apple orchards in this section, the cold weather in early summer destroyed the crop, but in some sheltered portions the trees are well loaded. Pears and plums are few, so far as I have seen.

E. L. T.

RUTLAND, Rutland Co., Vt., Aug. 10, 1878.

THE present prospect for the coming crop is that we shall have a most abundant yield—one indeed unusually heavy. Such are the reports from all parts of our State, as far as we have been able to learn. The recent plentiful rains, together with the warm temperature, have been exceedingly favorable for the growth of all kinds of vegetation.

M. S.

NEWPORT, Orleans Co., Vt., Aug. 10.

THE corn crop in northern Vermont is good, larger in quantity than an average by perhaps 25 per cent., and as far advanced as usual at this date. The wheat crop is also large, though somewhat injured by rainy weather at harvest. Our farmers will not buy much corn or flour this year.

T. H. H.

NELSON, Cheshire Co., N. H., Aug. 12.

THE prospect of the corn crop in this section is very good. The hay crop was better than it has been for several years. The farmers have had to fight the potato bug; some few have used Paris-green, but most have kept them off by hand-picking. The prospect is there will be a fair crop. The fruit crop is not quite as good as it promised to be in the spring, owing to a late frost; but still it will be good. We have had a great many heavy thunder showers the last few weeks. Fall feed is looking finely.

C. F. J.

BRIDGEPORT, Fairfield Co., Conn., Aug. 12, 1878.

CROPS of all kinds in this region of Conn. were never better. The corn crop never looked better, though the area planted is not as large as once, yet there seems now a full assurance of a good yield. The hay crop exceeds the product of any year since the war, but, were it not that the dry weather of two or three summers back has killed some of the grasses, it would have been greater. I hear, too, that very late frosts were in some sections injurious. Potatoes have turned out well; fear of the beetle kept back a large acreage from being planted. Still the grand yield will almost make up for that. But little complaint has been made this year about the pest. Buckwheat promises a glorious supply for our breakfasts. Farmers say they never knew a season of such seasonable rains and continued progress.

W. H. N.

BRIDGEWATER, Plymouth Co., Mass., Aug. 10.

THE corn crop in this section is looking well, though is no earlier than usual; but the hot weather and frequent showers are now pushing it—more attention is being given to this crop than formerly, and the acreage is increasing. Apples are plentiful, but pears are a small crop; small fruits abundant.

A. H. W.

BERLIN, Worcester Co., Mass., Aug. 19.

THE corn crop is very good, and so are other farm crops in general. Apples plenty and fair; peaches very scarce; pears few.

E. S. W.

WOONSOCKET, Providence Co., R. I.

CORN, so far as I have heard, is not an average crop hereabouts, and is considerably lighter than that of last year. The apple crop is very heavy, in this vicinity. Pears, quite light. Grapes, set well, but mildew and rot.

F. E. L.

SOUTHERN STATES.

LOVETTSVILLE, Loudoun Co., Va., Aug. 12.

THE corn crop is progressing rather poorly. It started weakly, owing to the continued cold weather in the early part of the season. The warm weather, and the several fine rains lately, have started it into new life; but the strength of stalk is wanting to secure a good crop. I am sure that, let the season be ever so favorable from this on, the crop will be short of an average one.

The wheat, I think, is about a fair average crop; occasional fields seemed to die off suddenly, and did not fill, while some filled quite well. This seems to apply to all of our section. The growth of straw was large enough. Oats were of unusually fine growth, but the excessively warm weather, just at the time of maturing, caused the kernel to be small and light. Early potatoes were unusually fine. The hay crop was very good. Grasses of all kinds grew very strong, clover particularly so.

The Virginia farmers attach a vast importance to clover. For a number of years past our clover has not been taking, and consequently fertilizing for wheat has been indispensable. We are now looking for a better time, as clover is quite promising at present. Our county is a noted wheat-growing section, and indeed all cereals do well. And if prices keep up to a fair standard, grain-growing will turn out a good business here. Our soil is very diversified. We have, through the middle of our county, a mountainous range that furnishes the very best of pasture lands.

Though the greater portion of our county is favorable to fruit growing, we have almost a famine in that line this year. The cherries, peaches, etc., were killed by a very sudden and severe snap of cold in January, and one morning at that time the mercury ran down 11° below zero. Then, on the 13th of May, we had a very severe frost that killed raspberry blooms and other things. Blackberries are usually very plentiful here, growing wild; but this year, just as they were ripening, the sharpest drought and heat set in and dried them badly.

J. G. R. K.

THOROUGHFARE, Prince Wm. Co., Va., Aug. 13.

THE corn crop here promises to be an average one. We have had fine showers the last two weeks to make the early and late planting well filled. On the best land it is well eared, and a good crop. Wheat is not an average yield, neither are oats. Most crops are already threshed. There is a great scarcity of all fruits, except grapes.

E. K.

DUNNSVILLE, Essex Co., Va., Aug. 13, 1878.

CROPS in some sections hereabouts are good, in others very poor. Wheat and oats were very poor crops. Gardens are like farm crops, variable.

R. S.

CHARLESTON, Jefferson Co., W. Va., Aug. 12.

OWING to the drought in the early part of the season, some fear was here entertained that the corn crop would be a failure; but for the last few weeks the season has been excellent, and the opinion is that there will be a good average crop.

E. B. D.

BENWOOD, Marshall Co., West Va., Aug. 12.

THE wheat crop never was better; the yield is some 35 bushels to the acre. It is winter wheat. Oats were a medium crop, but of good quality. Potatoes are only a fair crop. Small fruits of all kinds reasonably good. The corn crop, although planted late, will doubtless mature in time to yield a good crop, as the late rains have not, in any way, seriously damaged it in this section.

W. E. L.

SALISBURY, Rowan Co., N. C., Aug. 12.

THE small grain crops of this section were poor—only about a half crop. Corn was injured by drought, but is doing better since the late rains. Cotton backwards, but now blooming and fruiting freely. An average crop is expected. German millet has been sowed to some extent, and is well spoken of by those who have tried it. There is almost a total failure of the apple crop, and the peaches are very inferior in quality, but very plentiful. Potatoes (Irish) early and splendid both in yield and quality. Sweet potatoes are promising well. Country healthy.

M. E. H. S.

HENDERSON, Granville Co., N. C., Aug. 13.

THE prospect of the corn crop is very fair. The cotton is backward in consequence of a wet, cold spring, and a very poor stand in some places, but we have had some very warm, growing weather these last few weeks, and it looks well now. We had a fair crop of early peaches, but the late ones are not a very good crop any where hereabouts, and what there are seem mostly wormy. We have a very good crop of grapes; are shipping them now. Have no apples—being very few in the county.

W. B.

OKOLONA, Chickasaw Co., Miss., Aug. 13, 1878.

OUR corn crop will be moderate; wheat, sorry; oats, very fine this year. It is hard to tell about the cotton crop; we have too much rain. I am fearful that the worm will take the crop. Yesterday I saw four on one limb and three on another. It is cloudy and looks as if we should have too much rain. If so, the cotton crop will be short. There is too much late cotton this year, owing to a great deal of rain on the bottom land. It worked out of the grass late and that is the kind the cotton worm preys on.

T. Q. B.

GRIFFIN, Spalding Co. Ga., Aug. 13.

The corn crop was unusually promising in this section up to the middle of July. Dry, hot weather since, has cut it off to some extent, but the crop will be good; better than last year's.

J. J. R.

ROCKVILLE, Bates Co., Mo., Aug. 13.

CORN prospect below the average. Wheat injured by the rust—will average ten or twelve bushels per acre. Oats good. Potato prospect good. Timothy hay splendid. Apple crop short. Early peaches rotted; late ones good; rotting some. Small fruits were abundant. Weather has been extremely hot—is cooler now.

J. N. O.

LATEST REPORTS.

NEW YORK.

NORTH LAWRENCE, N. Y., Aug. 14.

The corn crop in this section is good, it is well cared for, and promises now to give a good yield of sound corn. Wheat and oats have done well in this section. The yield of hay has for the most part been very heavy. The potato, of all crops, has all through the season given the most uneasiness; the extreme earliness of the season led some to plant in March and April, and those fields were killed by frost in May, a great many potatoes also failed to germinate, and had to be replanted. The beetles came early, and so numerous were they, that people have had to work hard to save the crop. Some hand-pick, or knock them off, while others use Paris-green, but the bug doesn't care which way we try to kill him. It is very uncertain how the potato crop will turn out in this section. We have had a great deal of rain within the past month, and all lands, whether high or low, are wet; hence it is feared that potatoes will rot badly. The apple crop is very good, and we have good plums, we used ashes on our plum trees. Pastures are as fresh as they were in June. It is very warm, and we don't see any signs of fair weather.

A. H.

CARLISLE, Schoharie Co., N. Y., Aug. 14.

The hay crop was above an average in quantity, but the quality was not as good as usual; rainy weather ripened much before made, and much was damaged after being cut. Winter grain was good. There were many nice fields of wheat in this county. Spring grain of all kinds is below an average, spring rains having damaged the crops a good deal, and the rains in July causing them to rust. Potatoes will be a very poor crop—not that the beetles have injured them, for that is not allowed—but the season has not been right for them. Corn looks well; the growth of stalks is heavy, but the corn is two weeks later than last year. Buckwheat looks fine at present. Hops are not half a crop in quantity, and many are complaining of rust on them already, I saw one yard to-day looking as though it was honey-dewed; small fruit were a failure. There will be a fair crop of apples; some orchards are quite heavily laden, while others have but very few. Butter is selling for twelve and fourteen cents per pound. Cheese nets the patrons of the factory between six and seven cents per pound. H. J. S.

FRANKLIN, Delaware Co., N. Y., Aug. 15.

The crops taken as a whole, in this section, are considered above an average, as compared with the last five years. Oats and grass are considerably above an average. Corn a little late, but an average; an early frost may injure it. Potatoes, a light crop. Barley, heavy kernel, and an average growth. Apples, very wormy, rather small, and a light yield. Pears a light yield. These Delaware hills are a dairying region; comparatively little corn is raised here. Hay has to be stacked out this season on account of the quantity of it. A. T. M.

ORIENT, Suffolk Co., L. I., Aug. 14 1878.

CROPS here, are for the most part good. A large yield of wheat and oats, plenty of apples, but few pears. Late potatoes are looking nicely, early ones are of fair size and of most excellent quality. Corn is very promising in this immediate locality, but westward through Southhold, Peconic and at other places on the east end of the island, the Grub-worm is doing an immense amount of injury, insomuch that some fields will not yield over 20 bushels per acre. One farmer recently took 56 of these worms from one hill of corn. A. J. B.

NEW LONDON, Oneida Co., N. Y. Aug 15 1878.

THE corn crop, barring some accident, will be above the average. Potatoes rather poor, especially the early planted ones. The late ones may do better with favorable weather.

J. L.

PENNSYLVANIA.

WEST GREENE, Erie Co., Pa, Aug. 16, 1878.

THE corn crop in this vicinity promises to be fair; it is of larger growth than it has been for several years past. Wheat and grass, good, both more than an average crop; wheat about 25 bushels per acre. Apples and potatoes are nearly a failure; potatoes very small and but few in a hill. Oats about an average crop.

B. R.

DELMAR, Tioga Co., Pa., Aug. 14.

THE corn crop in this vicinity will not be over three-fourths of an average. No fruit, except on high ground, a few apples. The hay crop is uncommonly heavy. Oats, wheat and buckwheat fine. A. H. S.

WESTERN STATES.

BETHEL, Clermont Co., Ohio, Aug. 14.

The corn crop will not be more than two-thirds what it usually is, to take the county over. There are some exceptions, of course. The weather has been very warm, and there was not sufficient rain at the right time to make a good crop, but we have no reason to complain for the less of it, as we have had very good crops of wheat and oats, and in fact, of almost every thing which is produced in this part of the country, except potatoes; of them both early and late, there will be a short crop. We have had an abundance of all kinds of fruit, the products being so plentiful, the prices would not pay for the trouble of marketing. E. F. G.

BENNETT'S CORNER'S, Medina Co., O., Aug. 15.

Weather hot and dry. Corn was backward, but now bids fair for a good yield. Winter wheat and oats good; spring wheat injured by the fly. The bug and dry weather in July almost ruined the potato; the crop will be nearly a failure. Apples, pears, and peaches are abundant, early varieties decaying on the trees. J. A. B.

CHATHAM, Medina Co., Ohio, Aug. 14.

The crop of corn in most of the county is better than last year, but there has been so much rain that the corn on the river bottoms is badly injured, and also the potatoes. The oat crop is nearly one-fourth better than last year. Wheat, an abundant crop; hay, a very heavy crop.

W. H. M.

HANOVERTON, Col. Co., O., Aug 16.

Harvest is over. Wheat, a good crop in this section; hay is a large one; oats are excellent; corn is a good stand on the ground, but is late, not much of it in roasting-ears yet. Fruit plenty. E. R.

PENNVILLE, Jay Co., Ind., Aug. 13.

The prospect for the corn crop in this section is good. Wheat better than common, average 23 bushels per acre. The largest oat crop ever raised in the county. Potatoes injured by the heavy rains for the last four weeks. A heavy crop of hay, but, owing to the rainy weather, it did not get saved well. Apples and peaches scarce; plenty of small fruit; the worms are taking the cabbage; there are several remedies given, but none proves effectual. M. O. W.

LA FAYETTE, Tippecanoe Co., Ind., Aug. 15.

THE crops are above average as follows:—Corn, 25 per cent.; wheat, 75 per cent.; oats are medium; small fruits are and have been 50 per cent. above average. Potatoes are an average crop. Orchard produce 25 per cent. below average. L. K.

COLON, St. Joseph Co., Mich., Aug. 16, 1878.

AT this date the corn crop never bid fairer for a large yield. Apples—about half the orchards are full; some badly injured by May frost; fine quality; no worms this year. Wheat crop is good; farmer's price, seller's, $1 per bushel. Oats is a fair crop. Southern Michigan is hard to beat, hardly ever a failure in any crop. Some peaches; plenty of pears; only a few grapes, and these only where protected from frost. Farmers in general are going into mixed farming, raising wool, hogs, peppermint, etc. W. H. O.

LINCOLN, Mason Co., Mich., Aug. 13.

THE prospects for the corn crop are excellent in this part of the county. While riding through the county a distance of fourteen miles, last week, I noticed a great many fields and they all looked uniformly good. But we are having some dry weather just now, and if it should continue a week or two longer, it would materially hurt the earing. M. W.

BATTLE CREEK, Calhoun Co., Mich., Aug 15th.

THE corn crop bids fair for an average one in this section of the country. The fruit prospects are very poor. M. S. B.

QUINCY, Adam's Co., Illinois, Aug. 13.

The corn crop in this section seems to be fair but rather below the average. A hail storm in the spring damaged the fruit crop very much. There will be no apples to speak of. O. S. H.

SALEM, Kenosha Co., Wis., Aug. 13.

The corn crop will not be an average one, owing partly to the drought, but the spring was cold, and very rainy, so that it was late in starting a healthy growth. Oats and grass are excellent, and there were no winds and rains to throw them down. Potatoes are very poor, the tops are dying, and the tubers are few and small. I suppose this failure must be owing to want of rain at the proper time. The wheat crop is very light in this section, the failure being probably due to so many days of extreme heat. The earth is more like stone than like the soil, as it should be, for anything to grow. All kinds of fruit trees bloomed beautifully, and promised an abundant yield; but, like many fair prospects, there is but a portion of fulfillment, there are but few apples. I believe the buds were blighted by the cold rain, and last winds, and the frost in the spring. The strawberry crop was very light in this section, but raspberries were very good.

S. B.

DARIEN, Walworth Co., Wisconsin, Aug. 13.

Corn promises well, a little withered, but a heavy growth and good weather. Southern Wisconsin and northern Illinois, promise a large crop. Wheat poor, half a crop; oats and barley good. Potatoes light, small, and few in a hill. Hay crop, heavy. Wheat was injured by the extreme hot weather, and heavy showers. In some localities it was an average crop, in others, hardly worth harvesting. Apples, few and far between. The average, of course, I think, is less than last year. Z. H.

ARCADIA, Trempealeau Co., Wis. Aug. 14, 1878.

WHEAT, one-half crop; No. 2 oats are a good crop; barley, good yield but bleached; corn looks well now; there is but little grain raised here. Fruit was all killed by the frosts.

F. A. R.

PELLA, Marion Co., Iowa Aug. 15, 1878.

CORN and potatoes are needing rain pretty badly just now in this immediate vicinity. We are on the divide between the Desmoines and Skunk Rivers. They are about eight miles apart. It has been raining a good deal south of us lately, but on the divide it is getting quite dry. Corn was put in in good time and good condition; it is a good stand, and I think the prospects are better than they have been at this time for three years. T. N. H.

RED OAK, Montgomery Co., Iowa, Aug. 14.

THE prospects for our corn crop are most flattering, especially if frost holds off yet ten or fifteen days. Wheat is generally a light yield and poor quality. Oats fully an average crop. Rye good, but little sown. Flax good. No barley. Grass heavy. No winter wheat in this section. Fruit scarce because of late spring frost and for want of orchards. Farming community generally in good spirits and prospering. H. S. W.

CLARENCE, Cedar Co., Iowa, Aug. 15.

Wheat, five to fifteen bushels per acre, injured by rust and chinch bug. Oats, fifty bushels per acre, splendid. Barley, 30 to 40 bushels per acre. Corn promises well, where not injured by chinch bug. Potatoes poor, small. Apples scarce. Small fruit, poor crop; fruit-eating birds, ditto. Timothy, heavy on high ground, light on low ground. H. B.

HOWARD LAKE, Wright Co., Minn., Aug. 13.

The appearance of the corn crop, is, that there will be an extra one. Have never known it so good in the last twelve years. The prairies, doubtless, suffer more from recent winds, than we do in the "Big Woods." Fruit in this region promises only about two-thirds of a crop, although apples in some places are bending the trees to the ground, other trees have none. Grapes are much the same in amount, probably an average yield. Wild ones, mostly, if not all, killed by that noted frost in May. Also wild plums were killed as a general thing, but berries have been abundant. Minnesota is remarkable for its wild fruits and berries. A. A.

HOPKINS, Minn., Aug. 13.

The corn crop of this section is looking exceptionally good; the ears are large and well filled; a very heavy crop is expected. Oats are yielding from forty to sixty-five bushels. Wheat is very poor, ten to twenty bushels, and No. 2 is hard to get. A. E. B.

BROWNVILLE, Nemaha Co., Neb., Aug. 13.

THE prospect for corn in this county is splendid. There is a large increase in the area planted to this crop and the yield will be immense. Winter wheat is now being threshed, and some has already been sold; spring wheat has been considerably damaged by rust, the loss being estimated at about one-third. Nearly one-half the oat crop will be a loss from the same cause. Potatoes, cabbages and all vegetables, as well as apples, peaches and small fruit, are abundant. W. L. N.

CARLISLE, Eaton Co., Neb, Aug. 14.

THE corn crop in our vicinity is not as good as usual. The heavy rains in the spring delayed planting, and the severe drought of the last four weeks has injured it a good deal. Wheat and oats were both good. Wheat not as good quality as usual, however. Our fruit prospect is fair for peaches, but very few apples on the trees. Grapes were so hurt by the frost, that they will not amount to much. It is raining today, and the early corn will be a fair crop.

F. W. E.

SOUTHERN STATES.

CHAPEL HILL, Orange Co., N. C., August 18th.

THE cool, damp weather of the earlier part of the season injured nearly all the crops. The corn suffered, also, from cut-worms—in some places the farmer finding it difficult to get a stand. The summer has been very unfavorable, particularly to the corn, in much of the State of N. C. In June and July there was a great deal of dry weather, and the heat was intense. But about the main crisis the rains began and have continued, at short intervals, up to the present.

The CORN was, apparently, much damaged by the drought; but the improvement has been remarkable. Even the early corn shows promise of recovering, to a great extent, from its injuries. The later corn is flourishing. The crop has been well cultivated, and hence its rapid recovery from the dry weather. There is, at present, a cheering prospect of a sufficient yield of this indispensable cereal for the wants of the whole State.

The WHEAT turns out very discouragingly: While it has done exceedingly well in a few counties, it will average little, if any, over two-thirds of a good crop in the State. The rust was a leading cause. The yield of Oats is better than wheat, but considerably below a good crop.

TOBACCO has suffered from drought, and from various causes, the crop will, probably, be much short of a full one. Part of the best tobacco district has recently been visited by a very destructive hail storm. Cotton has been damaged, but shows hopeful growth since the rains.

From every part of the State the reports show an extraordinary product of Irish potatoes. All varieties have done well this season, remarkably well.

SWEET POTATOES are just beginning to seek the market freely. They will be in great abundance. The apples and peaches have disappointed us in both quantity and quality. The frosts destroyed them in some districts; while elsewhere, a peculiar blight, or insect on the leaves, or the "worm i' the bud," or sheer exhaustion from last year's heavy yield, or something else, damaged (if not destroyed,) what the frosts spared.

Many farmers are experimenting with golden millet and chufas. As to the former, I am quite sure that it does not equal red clover and Orchard-grass, on the same land, in this section. The difference is, in part, compensated by the fact that the millet comes so much sooner, can be cut several times in the year in which it is sowed.

At this writing the earth is thoroughly saturated, and the rains appear to be general. The signs augur much wet weather. The planters find an unexpected enemy in the abundant and rapidly growing grass, but it cannot do so much harm now. The season is timely for the turnip crop. In haste,

A. W. M.

BROOKSTON, Warren Co., N. C.

SEASONABLE rains are now improving our crop prospects. A large area under wheat, with a lower yield per acre, made the total number of bushels about the same as last year. Corn is now mostly in the milky state, and these frequent rains will insure a full average crop. Cotton suffered from cold during May and a part of June, though a good stand was secured, and the weather being favorable for the subjugation of grass and weeds, our fields are remarkably clean, and the plants are setting extremely full of balls. At this time planters are cheered with the prospect of a fair average crop. Probably there is not more than one-fifth the acreage in tobacco that there was in 1877; what there is looks fine. Sweet potatoes, beets, turnips, cow-peas, etc., are doing well. The third growth of clover is starting finely. Fruit crop various—many heavy crops, though some others light or total failures, owing to local causes, such as neglect, frost, hail, rot, etc. Prices realized for fruit generally satisfactory. M. B. C.

ALSTON, Fairfield Co., S. C.

THE crops are the best we have had in this county for years. D. R. E.

BOONE Co., Ky., August 16, 1878.

THE corn crop in this part of Kentucky will not be an average one, it is thought. The excessive heat dried the silk prematurely, and the grains are not filling out evenly. As to apples, the yield is a very fair one, while with the damson plum it is somewhat over the average. Trees of the large blue plum, and those of the wild red ones, have been excessively laden.

Y. S. G.

GLASGOW, Barren Co., Ky., Aug. 16.

CORN crop in this section of Kentucky has suffered for rain; we need rain now. The corn crop will be, perhaps, but little better than two-thirds of a good average crop. E. Y. K.

NEWPORT, Campbell Co., Ky., Aug. 13th.

JUST now a threatening drought prevails in this section. Unless rain should fall plentifully in a few days, but little corn will be raised. Apples and other fruits moderate in quantity.

EAU GALLIE, Fla., August 12, 1878.

HERE, on Indian River, crops have this year been excellent. Orange trees have made a fine growth and the crop will be very large. Pine-apples are found to do splendidly here and are receiving a great deal of attention. Grape culture also is attracting unusual attention hereabouts; Roger's Hybrids doing excellently, especially Goethe. Bees do well here, gathering large quantities of honey from this Flowery Land, and needing no feeding in winter. The cultivation of sugar-cane has lately been extensively entered upon with very satisfactory results. Many are also planting groves of guavas and bananas, and both are doing very well; the banana bunches being very large and the fruit well filled. A very large crop of sweet potatoes was put in, and they are doing remarkably well. T. H. S.

ATLANTA, Fulton Co., Ga., Aug. 14, 1878.

THE corn crop of this county is but 66 per cent. of a good crop at this time; but in conse-

quence of a rainy season, just set in, it may go as high as 80 per cent. C. D.

SIX MILE, Alabama, Aug. 13, 1878.

THE corn crop in this section is better, on an average, than in many years. Fruit crop almost a failure—very wormy and faulty. Cotton crop not so good as last year. Now having too much rain, and prospect of more. B. G.

COLUMBUS, Lowndes Co., Mississippi.

THE prospects of corn-crop are good—better than last year at this time for cotton. Corn in the uplands good, but in lowlands poor, in consequence of much rain in the spring. From the same cause fruit is in a great measure a failure. Oats all over our section are splendid. Wheat the same, although we do not do much at that. W. N. M.

APOPKA, Orange Co., Fla., Aug. 8.

THE crops of this county are corn, a little cotton, a great deal of sweet potatoes, watermelons of very large size and fine flavor, and for oranges, this section is especially well adapted. In some portions of the county banana culture is receiving considerable attention, and bids fair to turn out highly profitable, but as the plant is very susceptible to cold, it requires large water protection on the north to insure success. Grains suited to the soil are being extensively introduced. Para-grass for our lowlands and Guinea-grass for the uplands. The pine-apple, too, has lately been largely introduced and promises to be a paying crop. All crops this year have been very good. C. H. M.

PLEASANTON, Atascosa Co., Texas, Aug. 9.

THE cotton and corn crops in this county will be considerably above an average both in yield per acre and in area planted. Stock raising, however, is the principal industry, especially sheep; indeed the greater part of the county is a vast sheep farm, and there is more money invested in this branch of industry than in any other. It is calculated that sheep double in value in three years; and at present they are each worth $1.50 to $2.50. The soil consists mainly of a sandy surface with a clay subsoil, and contains a large admixture of vegetable matter, which renders it highly productive. There are here some of the finest farms in western Texas, producing large crops of corn, cotton, tobacco, peaches, figs, plums, and every variety of vegetables. The price of land varies considerably, but may be put down at 25c. per acre for unimproved, and from one to ten dollars for improved land. The area of the county is about 1,300 square miles, and its population in the neighborhood of 7,500, about half of whom are Mexicans. In this town, the capital of the county, beef is five cents per pound; bacon, ten cents; corn fifty cents per bushel; meal, seventy cents; flour, ten dollars per barrel. J. K. S.

HOUSTON, Harris Co., Texas, Aug. 16, 1878.

CROPS in general throughout the country are the best for many a year. Corn plentiful; a little worse in quality on account of too much wet at gathering time. Oats too, are damaged by the same cause, though a bountiful crop. Cotton is being picked and promises an A1 crop throughout the State. Peaches never as plentiful in the central and upper parts of the State. Grass knee-high through the prairies; therefore cattle are in tip-top condition. Weather warm; rains daily. G. M.

VAN BUREN, Crawford Co., Ark., 12th Aug., 1878.

The present and past season s have been most propitious for growing crops throughout our entire State. Scarcely, if at all, in the memory of the oldest citizen, has there been such a prospect of heavy crops of corn, cotton, and grapes. The wheat crop was a failure; too much wet weather through the past winter was the cause chiefly. The oat crop was simply enormous, from 40 to 80 bushels are represented to have been thrashed and cleaned per acre. Our fruit crop is variable. The peach crop measurably a failure. Grapes almost an entire failure from mildew and rot; wet weather the cause. Norton's Virginia and Ives' have done well. Apples are very fine, but the crop is not heavy, and why no one can tell, as they were no late frosts, or storms of any kind. Trees were full of bloom, but somehow did not set much fruit. Pears are extra fine; my Bartletts were the finest I ever saw; all ripe and gone. Seckels are extra beautiful and sound; are now being gathered, and must soon be disposed of, or they will rot, as the thermometer still stands up to 90 in the shade. Duchesse D'Angouleme, Howell and others, are looking well; the latter two varieties just about ready to be gathered to house-ripen. The blight has been very severe in certain localities. Much complaint from low and damp situations, while from high and dry well-drained lands but little complaint of blight. But for that one cause, we have, I do really think, the finest pear country in the United States. All kinds, up to about 41 varieties, have been tested by myself and immediate friends with the most perfect success, until struck by the blight, which does not often attack the tree until about the time it begins to fruit, when it is almost certain to show itself, and is terribly fatal to certain varieties, while Seckel, Duchesse, Winter Nelis, Virgalieu, and Howell, so far seem almost entirely exempt from the disease. I have Seckel and Duchesse 25 years old, and they have never been touched by blight, and have borne full crops of fruit for the last 15 or 16 years regularly. Our peach crop, which, as a rule, is the most reliable of all fruits in our State, was this year ruined by the curculio, which has never commenced extensive depredations on our peaches before. It was not the regular plum curculio, but something very nearly the same. R. T.

SEDALIA, Pettis Co., Mo., Aug. 16.

We have had a remarkably hot, dry season, a good rain last Saturday, which will help the corn very much. It is yet almost too early to form a correct estimate of the late corn crop, but I think it will give a very fair yield. Early corn good; also potatoes. Peaches, grapes, and other small fruits plentiful. The apple crop will be light. E. R. L.

BETHANY, Harrison Co., Mo., Aug. 14.

This county is 32x24, miles and the surface is diversified, rolling prairie, and level prairie, timbered ridges, and river bottoms. Corn in the north part of the county owing to more frequent showers, will be an average; in the center and south parts, will be out short by drought on timbered ridges; an entire failure on the bottoms, but will be good, all over the county, acreage larger than usual. J. W.

PROVINCE OF QUEBEC, Canada, Aug. 13.

The corn crop in this section is very good; the hot dry season we have experienced with a steady thermometer at 90° for weeks, has hastened the growth of this staple of the poor Canadian, and it bids fair to be an abundant yield. Sweet-corn was ready for the table by the end of July, and the fields of common yellow are looking well, except in localities where grasshoppers threaten to do some damage to the foliage, stripping the ears. A. L. J.

Various.

EUROPEAN CORRESPONDENCE.

LETTER FROM PROFESSOR I. P. ROBERTS, OF CORNELL UNIVERSITY.

A VISIT TO TIPTREE-HALL FARM.

Mr. Mechi and his Farm—A good Foundation—Reclaiming a Clay-bed—Stock Management—Rotation of Crops—Large Crops—Liquid Manure—Mr. Mechi's Principles and their Beneficent Results.

KELVEDON, ENGLAND.

TIPTREE-HALL, the home of J. J. MECHI, is situated four miles from the Railroad Station, and forty-five miles from London. I did not expect to find such poor land in all England as some I passed a half mile before reaching his farm; and yet out of land but a shade better than this by nature, he has made one of the most productive and profitable farms in England. He is still a hale and vigorous old man, and as enthusiastic as ever in improved and in improving agriculture. It is no superficial work that he does or aims at, but he commences at the root—education. His workmen could neither read nor write, so the first thing was a schoolhouse; but knowledge is worth but little without morality, so the next was a church. The effect of this early work I could see in the honest and intelligent look of his laborers.

The farm is composed of 173 acres, nearly all of which is heavy clay land. But "heavy clay" means quite a different thing here from what it does in America. Most of this farm is so intensely clayey that it will not make good brick or tile, and is by nature like a mortar-bed in wet weather, and like a rock in dry. Again, he strikes at the root of the matter and relieves the land of stagnant water by blind drains laid four feet deep. Next, the open ditches were filled up, and three miles of inside hedge fences removed. These improvements not only gave several additional acres of land, but transformed small irregular fields into large square ones suitable for cultivation by steam, a thing which he most fully believes in and puts into practice. The barns next received his attention. Covered yards were built adapted to soiling, and for years no cattle have run at large either in summer or winter, while the sheep are always folded in the fields, the fence used being an iron one on wheels, which is not only light and durable, but easily handled.

They were just sending their last consignment of green peas to the London market. The ground on which they grew will be plowed immediately and sowed to turnips. Half of the crop will be removed, and the other half fed to sheep on the ground, with the addition of some oil-cake and maize. This he claims will leave the ground as fertile as when the peas were planted. As dry and hard as the sand is now, it will take more labor to fit it for turnips than they would be worth in the United States. But here it is very different, and an Englishman never waits for rain but plows, cost what it may.

The immense clods I have seen turned up in the clay within the last few days, would appall anyone not used to them. Experiments in various courses of rotation, depth and time of plowing, have been conducted by Mr. MECHI for many years, and I understand from him that, as a rule, he would recommend a four-year rotation, deep plowing by steam, during the dry weather of the summer months; thus thoroughly aerating the soil and at the same time destroying the "twitch" grass that gives so much trouble in many parts of England. Whether the large crops of wheat and barley I saw growing were attributable to these causes or to the liberal application of farm manures, made by fattening animals in covered yards, or to all combined, I cannot say; but certain it is, that success has crowned his efforts, and the proof of it was before me in the large fields of wheat and barley almost ready for the reaper, which would not fall short of 50 bushels to the acre of the former, and 60 of the latter.

His system of sparred floors in a small portion of his cattle-sheds, whereby the manure—no bedding being used—drops directly into the manure cellar, did not strike me favorably, and they would certainly not do for a milk dairy or for animals in a cold climate. The stench and dampness are certainly both very objectionable, to say nothing of the discomfort to the animals from not having bedding. The manure that passes through the sparred floor is diluted, and then forced by steam-power through pipes, in some cases to the distance of half a mile, where it is usually distributed over land that is devoted to the production of Italian rye-grass—Setaria Italica—having learned by experience that it takes kindly to this liquid manure even on clay land, while most of the other grasses and clover do not. Though all might not agree as to the minor methods which he advocates and practices, yet it is certain that, as a whole, his system has resulted in not only remunerative harvests, but they have, in connection with his writings, been the means of bettering the condition of employed and employer, and they have also, by setting forth a more excellent way, done much to improve agriculture at home and abroad.

We cannot help but honor and admire this veteran farmer when we hear him, in his terse and forcible language, advocate deep plowing; covered barn-yards; soiling; uprooting of obstructing useless hedges and trees; large fields well under-drained; iron fences where any are needed; steam before horses; and horse before man-power; repeal of laws that hamper and obstruct agriculture; transfer of lands or leases; *intelligent* laborers; and, last but not least, free education to all.

STATE INDUSTRIAL SURVEYS.

WE have geological, botanical topographical and scientific surveys of the different states which have done much good in the directions specially required of them, but no complete industrial record or map of the state can be obtained from all these together. We know that in some parts there are coal; in some others peculiar kinds of clays or stones, but a map of hills and mountains and their contents, of valleys and streams together with an account of their adaptability to particular products or the amount of land uncultivated, the water-powers, forests, kinds and extents, and the products now found, and the practicability of other industries, of these we know of no State in the Union which possesses anything like an account.

This is the peculiar business of the several States, and their growth and prosperity depend upon such knowledge more than upon all other things together. The presence of moist or swamp lands which may be drained, the feasibleness of water-power, or railroad connections, and the labor for them to do, advantages offered to settlers or capital and what industries are in part or wholly established or neglected and in what particular localities situated, would do very much to direct attention to the development of resources and the establishment of new industrial enterprises.

There is no reason why emigration should go to the West of the Mississippi river for farms when half the lands of the Eastern States is idle, or why people should be idle when ten acres of land will give any man ample employment and hundreds of thousands of such plats may be had in any State upon the easiest terms imaginable. Probably no State in the Union has more water-power, more fertile idle lands, and other natural resources than North Carolina, yet it is next to impossible to ascertain trustworthy facts in relation thereto from any body in the State or out. Nor is this an isolated instance. Indiana has natural resources to place her upon an equal footing industrially with any State in the Union and half her lands are yet in their primeval fertility. The world needs but to know the industrial advantages and resources of each State in this great country to double its population in many instances and to add untold wealth in development of resources in others.

Industrial Implements.

A FOREIGNER'S OPINION.

L'ECHO AGRICOLE has been looking at the American exhibit of farm machinery in the Paris Exposition, and has arrived at several conclusions that will be interesting to our manufacturers. It says:

Among the foreign sections it is the United States which first strikes our wondering attention. It is difficult to imagine a collection more rich and at the same time more elegant.

To see the threshing machines, constructed with perfect taste as to shape, and with richness in the materials employed, true specimens of cabinet-work and inlaying; these reapers and mowers, where all the metallic portions shine like silver, one does not imagine himself in the midst of apparatus destined for work which is reputed vulgar, such as cutting the wheat or mowing the grass, but in a store of enormous jewelry and among true works of art.

Never, in any country, have been seen such grace and splendor. If by the magnificence of the machine we are to judge of the character of the workman who runs it, one would be inclined to suppose the American farmer to be equally fine, walking the earth, not in blouse and wooden shoes as with us, but in full-dress and with hands gloved.

If you think we exaggerate, we ask you to come and examine the threshing machines, the reapers and mowers, the weighing machines and scales, the lawn-mower, the grain-drill, and the horse-rake, of which the seat resembles a throne and is shaded by a blue-satin canopy, having without doubt for its mission to guard from the sun the delicate complexion of the driver.

A NEW CHEAP HORSE-POWER.

A ONE, two or three horse-power that can be set up inside the barn in less than 30 minutes, and when its work has been performed may be folded up and laid aside out of the way, must, it would appear, be a serviceable implement. An illustration of such a power may be seen in our advertising columns.

A wooden wheel hinged through the middle is suspended horizontally upon an upright shaft by means of jointed guys. The belt is applied to the rim of the wheel and acts as a tire upon it. The shaft turns with the wheel, and as it makes but one revolution while the horse travels 30 feet, the friction is inconsiderable. Its uses will suggest themselves to any farmer, while its compactness, portability and cheapness are strong points in its favor. Messrs. Harlow Bros., Lancaster, N. Y., are the manufacturers.

THE PARIS AWARDS.

IN the award of prizes at the Paris Exposition, the United States agricultural exhibit has received a diploma of honor. Of the 11 objects of art offered by the Agricultural Society of France for exceptional merit in agricultural machinery in the recent field trials, eight have been awarded to American inventions. Dr. Edward H. Knight, the American Juror of Class No. 76, has been authorized to announce the awards. They are as follows: W. A. Wood M. & R. Mch. Co., on their reaper and binder; Johnston Harvester Company, on their machines; The Farmer's Friend Grain Drill Co., on their drill; Wheeler and Wilson on Sewing-machines. Jno. Daere & Co;, on gang-plows; P. K. Dederick & Co., on Hay Presses.

THE JOHNSTON HARVESTER COMPANY are perfecting in their works at Brockport, N. Y., a new light double-geared mower. Experiments in the field have been very satisfactory, and the implement promises to be a success. It will weigh about 540 pounds. The mower will be put upon the market next season.

THE N. Y. Plow Co. has just completed its new works comprising a main building 400 feet in length with foundries, &c. adjoining. Everything in the way of new machinery that can facilitate and improve its products is to be used. The shops are located at Newark, N. J.

Farm Topics.

HINTS FOR THE SEASON.

BY A JERSEY FARMER.

FODDER CORN.

THERE is no doubt that sweet corn makes the best fodder. The dry digestible matter is the measure of the nutriment contained in food; and, as sweet corn contains more sugar than the ordinary field corn, it must be therefore more nutritious. Sugar is nutriment. It furnishes carbon for the sustenance of the animal heat, and also for the function of respiration, as well as the formation of fat. An animal consumes much more of carbon than of nitrogen; and carbonaceous food for a butter cow, a greasy-wooled sheep, a fattening ox, or even a store animal, which is only expected to keep in fair, thrifty order, is by far the most needed kind of sustenance. Besides, one object, if not the chief one, of the good farmer, is to induce his stock to consume all the food they can; not to stint them, but quite the contrary; knowing that as they thrive, so he thrives with them and by them. A great deal of nonsense has been uttered about the poor character of fodder-corn, as to its watery nature when green, and its likeness to chips when dry. But it will be noticed that if a cow is provided with half a bushel of clean sweet corn-fodder at one end of her trough, she will often leave a mess of meal and middlings, to eat that first. It is always safe to trust to the judgment of a cow in matters of this kind, and the cows are invariably in favor of sweet-corn.

Where sweet-corn ears are sent to market from farms near the large cities, the stalks may yield a crop worth as much as the grain. When corn ears are sold for 40 to 60 cents a hundred, the stalks are actually worth more than that if they are properly saved. Where the ears can not be thus sold, the grain may be made worth their market value for the winter feeding of milk cows. No other food helps the pail and the churn so much as this—the stalks and ears being cut up and fed together. But to save them is the great trouble.

SAVING CORN-STALKS FOR FODDER.—This may be done as follows: — Take the Lima bean poles not in use, and where Lima beans are generally grown they are not now in use, because the value of beans is too low for profit; where they are not grown, poles six feet long should be procured from the woods, or fence stakes; defective rails, and such waste stuff may be utilized. Bore two holes cross-wise, an inch in diameter and a foot from the larger end, and put small rods, two feet long, in these, sharpening the small ends. The stake will appear as shown in the engraving (fig. 1). This is planted in the ground in the place where the shocks of fodder are to be placed. The stalks should be cut as soon as they are ripe. They may grow for two weeks after the ears are pulled. They will cure all the better when permitted to ripen their sap, and much of the usual difficulty of curing them will be avoided. If the ears are not pulled, and the corn has been grown solely for the fodder, and has been planted so closely as to prevent the formation of ears, the crop may be cut as soon as the first of the leaves change color, and extra care will have to be taken in the curing. When the stalks are cut, they should be left on the ground twenty-four hours to wilt thoroughly; then bound in small sheaves of not more than one good arm-full, and the sheaves set up against the stake before described. This will sustain the shock and prevent it from being blown or falling over, as well as from falling together in the center, so as to prevent thorough curing. When a good-sized stock is made, the top is bound above the stake, but left open below. Thus left, it is protected from the weather and will cure perfectly in two or three weeks; the time depending upon the condition of the weather.

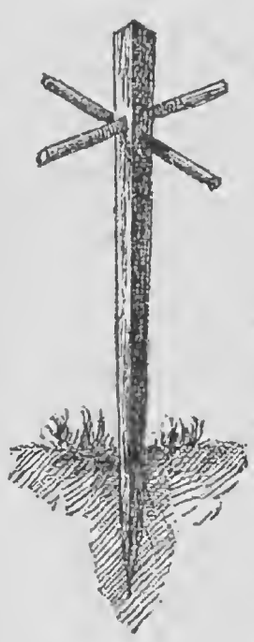

FIG. 1.

WATER-FURROWS FOR WINTER GRAIN.

Farmers are now fitting their ground for fall grain crops, and many, not having the fear of the Hessian Fly before their eyes, and wishing always to be forehanded with their work, will sow their fields this present month. The first thing that should be done after the ground is sown, is to make water-furrows to carry off the rain. No one knows how soon a heavy shower may fall upon the soft, loose soil, and if unprepared, the beating rain will soon wear many little furrows, which converging, will gather into larger ones, and these again into a torrent, which will wash the soil and perhaps carry off the fertilizers and grass seed on to a neighbor's farm, or certainly where they will not be wanted. So the water-furrows should be made without delay, and on the proper making of them depends their effectiveness and the safety of the field. A few rules for the making of water-furrows may be given.

HOW TO MAKE THEM.—They should never be carried directly down a slope. The quickest way to get rid of the water is the most injurious way. The water should be carried down the slope as nearly level, and should be distributed among as many channels, as possible. The ground covered by the channels is not lost, or useless; as many plants of wheat and grass will be found in them as elsewhere. By distributing the water in many channels, and delaying its escape, more of it will be absorbed by the ground and there will be less of it to run off. Thus the soil will be benefited to a greater extent, as well as damage to it be prevented. The form of the water-furrow is shown at fig. 2. It is made by throwing a furrow slice

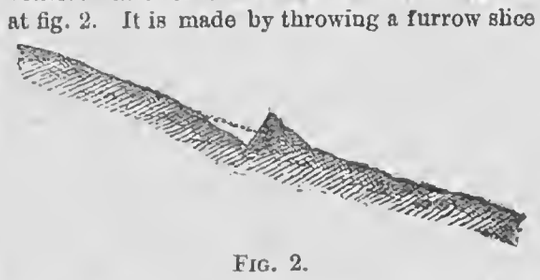

FIG. 2.

down the slope, thus leaving not only a channel to catch the water flowing from above, without impediment; but forming a dam to prevent it from overflowing down the declivity. If the furrow slice is turned the other way, the water must first collect above it, until it breaks through; when the loose earth is washed into the furrow, which is soon filled and choked, and the wash then begins straight down the slope and enlarges at every foot in its course. This is not infrequently done by careless hired men or by equally thoughtless farmers themselves. These furrows should be carried as little from a level as may be necessary to convey the water away as fast as it may collect. A slope of one foot in a hundred will do this.

A PROPERLY DRAINED FIELD.—A plan laid out for a typical field is given at figure 3. In the center is a piece of high ground gradually sloping to the diagonal lines *b b*. The highest points are at *a a*, and the lowest boundary of the field at *c*. The arrows show the general slope, being between that from *a a a* to *b b*, and from *a b* to *c*. Now, the usual way would be to carry furrows in the lines of *b b* only, down to *c*; or at least to make one or two down in the direction of the arrows. This would inevitably cause washing; first in the furrows down the main slopes, and then in those at *b b*; because all the water would be collected as rapidly as possible into one channel, which, in case of a heavy rain, could not dispose of it safely. But if the furrows were made in the directions shown by the lines, the water trickling down the slopes would be arrested before it became unmanageable, and would be conveyed away from the channels *b b* down to the foot of the field *c*; where it would find its escape in the ditch or along the fence row, which being grassed over

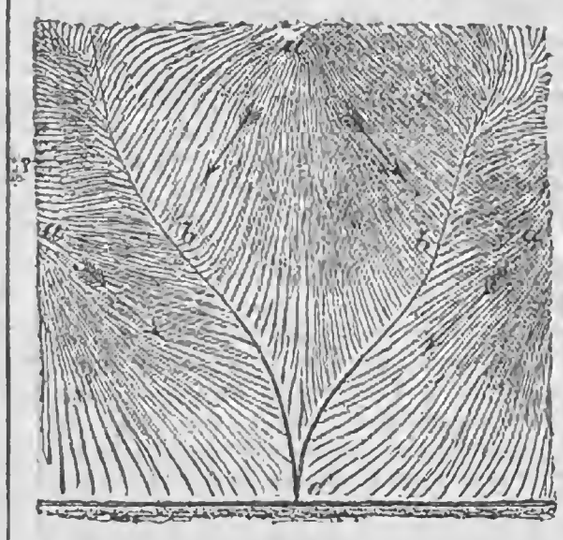

FIG. 3.

would not suffer. The channels *b b* would have to take water only from the center of the field, and a very large proportion of that which falls there would soak into the soil, leaving but a small quantity to run off. The fact is this plan would provide a method of irrigating the field as well as draining off the surplus, thus avoiding what is one of the most serious difficulties of our climate, viz.: an excessive rain-fall at some times and excessive droughts at others. The plan here given could be modified so as to suit any form of sloping ground with the greatest ease.

A GOOD SHOW FOR A CITY-BRED FARMER.

I HAVE been struck lately with the RURAL'S articles relating to the cultivation of wheat. I would love dearly to raise 60 bushels to the acre, as my average product heretofore has been but 30 and 35 bushels; but if I lose a year in after fallows, where is the gain? To be sure, I could, after harvesting the wheat, put in another crop seeded to grass, but that would be rather hard farming. I could, instead, the next spring, put in corn, oats or other spring-sown crop, but it might not suit to do this. It is always safe to have one's ground in grass, and it takes better with wheat than anything else, and there is no time lost. There is no better rotation, I conceive, than breaking up sod for corn, then oats, or, as I prefer, half in potatoes, and half in millet, then wheat, then clover. Oats I have discarded for many years, as it pays nothing. Potatoes are less hard on the ground, pay better, and wheat takes well after them. The advantage in millet (German is the best) is, that the grower has the option of converting it into hay, if the season has been a bad one for timothy or clover; and, if the contrary, he can let his millet ripen and he has either a good market for the grain or he can feed it to his horses, for which purpose it is more valuable than an equal measure of corn.

Every farmer should, I think, have a specialty, dictated by the character of his land and the wants of his market. Mine is gilt-edge butter, which pays well. With pastures running to green grass, with copious springs in every field, with an appreciative market within an hour's railroad time, with dairy women on every side, that can make choice butter as naturally as they eat or sleep, one drifts to butter as a natural sequence. If one could have permanent mowing ground, then it would pay best to keep cows enough to pasture all that was not needed to furnish them with a winter stock of hay. A dairyman could then well afford to purchase the needed corn and bran to keep his cows milking in winter. No one, however choice his butter, can command the best market price for it unless he has special customers, and they can only be had by furnishing them with the golden prints in winter as well as in summer.

Failing this permanent mowing ground, it follows that one field has to be broken up every year, and hence the study required to follow the best rotation. To a certain extent, I think I have attained the point in devoting two of my fields to a constant rotation of wheat and clover. I take off a crop of wheat this year; next, one crop of clover: let the grass grow till the clover-heads begin to ripen, turn it over with a Syracuse chilled plow—which is admirable in covering the grass—and seed to wheat. With no other manure, I find my ground growing richer and richer. I have never failed in getting a good clover catch, which I attribute principally to my practice of sowing 500 pounds of plaster to the acre. It costs only $1.75, and insures moisture in a dry spring, which I take to be the chief cause for a poor clover catch. This course gives me an abundance of clover hay, which is the only sort a butter-maker wants, gives an ample supply of barn-yard manure, and consequently good crops of corn, potatoes, millet or what-not. Last year my corn-field shelled out 98 bushels sound corn to the acre all over the field. My timothy field cut four three-horse loads to the acre. I could ask no more, for it was as much as there was room to cure.

If the RURAL will tell me how I can improve my system, I will gratefully listen.

Chester Co., Pa. A CITY-BRED FARMER.

Field Crops.

THE TOBACCO PLANT.—No. 3.

E. R. BILLINGS.

WHAT KINDS TO PLANT.

WE COME now to a very important question, and one which the grower of tobacco cannot well afford to lose sight of. What variety is best adapted to my lands, and what variety will bring me the greatest profit? are questions which we now propose to consider and answer.

Seed-leaf and cutting tobacco are ordinarily grown in different sections of the State or country. True, in some States, like Ohio and others, both cigar-leaf and cutting tobacco are grown, but this is the exception and not the rule. Then, too, there are some sorts of tobacco that may be used for nearly all purposes for which tobacco is designed. This is the case with Perique tobacco, grown on the banks of the Mississippi in Louisiana, by a few small planters. It is used for smoking (in the pipe), chewing, snuff, and is also used in the manufacture of cigarettes. I do not think it is used for cigars at all. In New England our growers have from the time of the first planting of tobacco in the States (1634), grown only cigar-leaf tobacco. I do not assert that cutting-leaf cannot be grown in this section, and with profit, too, but as it has not as yet been tried, mere conjecture does not avail. It would seem, however, as both kinds are grown in Ohio, that our soil might do equally well.

Along the Connecticut river, beginning at a point about 30 or 40 miles from its mouth and extending all through Massachusetts, and also into New Hampshire and Vermont, is doubtless one of the finest tobacco-growing sections in the world. The rich bottom or meadow lands bordering the river are particularly fine for the plants, while they grow luxuriantly farther from the river on land known as a sandy loam. Such has been the advance in the methods of fertilizing and cultivating, that from 1800 pounds to the acre the product has increased to 2,000 pounds, and sometimes 2,300 pounds have been grown to the acre, when the soil has been made very rich, or when the plants have been "set" close together.

A great advance is also noticeable in the color and size of the leaves. Formerly the color was very dark, but during the war and some few years after, the demand was for a leaf of a light cinnamon color. To meet this demand the growers selected light soil for the plants, and used freely of horse manure, and the color was usually light. Of late the demand has been for dark-colored leaf, and so the growers have chosen dark loamy soil and applied stable manure, tobacco stems, castor pomace, etc., and have again secured the color in demand. It will be seen, then, that the color and size of the leaf may be regulated by the selection of soil and the fertilizers applied.

The grower then inquiring what variety to plant, should be governed in a great measure by his lands, their situation, color, the elements composing the soil, etc. If his lands are light in color, then by nature they are better adapted for the growth of light-colored tobacco than for the dark. If the soil is dark, then dark-colored leaves will be the more readily and surely produced. Meadow lands usually produce darker-colored leaves than the uplands, while there is less liability to sudden frosts which spoil the leaves and render them wholly unfit for use. When the culture of Havana tobacco was first attempted in the valley, some few years since, the lightest-colored soil was selected and the very warmest situation was chosen, frequently planting the crop between two hills. Many supposed this was the method adopted by the Cuban growers, but such is not the case. They usually plant the tobacco in land bordering small streams and rivers or moist land, and instead of setting out the crop in the spring, plant in November or December. At the South and West "new-cleared" land is considered the best as the product is thought to be better-flavored.

For years the tobacco soil was not manured at all, and, as a consequence, vast tracts of land were ruined by the cultivation of this great exhauster of soils. Now, however, large quantities of guano and tobacco growers are used and the lands are improving by the use of fertilizers. New England is doubtless a better seed-leaf-growing section than either the West or the South, but in some of the Southern States seed-leaf has been tested and with the best results. In Florida seed-leaf is grown in one county (Gadsden) with much success. It is a variety of Havana, and though less pleasant of flavor, it closely resembles that famous variety of the plant. Experiments made with both cutting and cigar-leaf can be tried and the result will be apparent. I hope the day is not far distant when the growth of cutting-leaf will be tried by the growers in New England.

Veterinary.

THE TRUTH ABOUT IT.

[UNDER this heading, a number of articles have been prepared by able writers. These will appear from time to time. Their object is not at all to deal with "humbugs"—but with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

IMAGINARY DISEASES OF ANIMALS.—No. 2.

D. E. SALMON, D. V. M.

WHEN an animal is sick, it is perfectly natural for the owner to endeavor to discover the nature of the disease, no matter how ignorant he may be of such subjects; consequently, an examination is always made in such cases, and if anything is noticed which has escaped observation in the healthy condition, or if real peculiarities are seen, these are generally associated with the disease and considered its cause. And, in case the supposed peculiarity exists in a single organ, there is a tendency to consider that similar symptoms are caused by that organ in other cases where the peculiarity does not exist; thus, in my first article on this subject, I stated that all cases of loss of appetite with horses are apt to be referred to Lampas whether there was congestion of the palate or not, and that lame back is treated by cutting the eyes even if known to be caused by a strain. And this is not surprising, for people naturally refer all effects to some cause—and such cause must be within their powers of observation. As most stock-owners know but little of anatomy, physiology, or the symptoms to be expected in different diseases, it is not to be expected that they can detect the diseases of deep-seated organs or discriminate between them; consequently, they recognize but few diseases. I have given some examples of this, and shall now give more.

BOTS.

Perhaps these insects should not be classed with the imaginary diseases or causes of disease; but so much more is ascribed to them than they

are guilty of, and the attempts to dislodge them often produce such injuries in the affected horses, that I cannot dismiss the subject without a few words. Bots, as found in the stomach, are the larval forms of several species of *gadfly*; when in large numbers, and especially when hooked to the walls of the sensitive part of the stomach, or to those of the intestines, they interfere with the processes of digestion, and in that way may be a cause of sudden and fatal colics. A very few cases are recorded by veterinarians where one or two of these parasites had perforated the walls of the stomach or bowels and were found in the abdominal cavity; but such cases are extremely rare, and we can only consider the many cases given by farmers where the stomach was said to be riddled by these parasites as errors of observation. The great majority of colics have no connection directly or indirectly with these insects; colic is usually the result of indigestion from other causes, of nervous cramps, of hard, impacted manure—constipation—of congestion or inflammation of the bowels, hernia, etc., and must be treated according to its nature. The general practice of treating all forms of colic with agents for the destruction of bots, is extremely irrational, and causes an immense loss to our farmers each year. I have sometimes thought that more horses die from such treatment than from all other causes combined. It must be remembered that, in cases of colic, the stomach and bowels are either inflamed or rapidly approaching this condition, and that we should be extremely careful in our choice of remedies. But so far is this principle forgotten that the most irritating agents are generally used, and I have known of cases where even *boiling water* was poured down an unfortunate animal's throat in the hope of killing "bots!"

HOLLOW-HORN.

Turning to cattle, we find here, too, the same ignorance of their diseases and the same blind adherence to the traditions of the dark ages. With the great mass of our farmers cattle have scarcely more than two diseases—"hollow-horn" and "wolf-in-the-tail"—opinions too ridiculous for notice were it not for their prevalence and widespread character. The horns of cattle are formed by the growth of a bony projection, which soon becomes attached to the skull, and the transformation of the epidermis over the protuberance into horn; they are, therefore, composed primarily of four different layers. Commencing on the outside, there is the horn or epidermis; then the true or sensitive skin; next to this, the periosteum or vascular membrane covering the bone, and finally the bone itself. By pressure between the horn and bone, the true skin and periosteum become consolidated into a single vascular and sensitive layer; and, very early in the life of the animal, a cavity begins to form in the bone of the skull beneath the horn, which extends by absorption of the bone, reaches the bony support of the horn and penetrates this, and continues to enlarge during the life of the animal. In old animals there is only a thin shell of bone with a large cavity inside, divided perhaps by a thin, bony partition, and lined with an internal periosteum and a delicate mucous membrane. This is the *natural* condition of the horn—a provision for lightening what would otherwise be a heavy and cumbrous structure; and so far from being a condition of disease it was designed by a wise Creator as a benefit to the animal.

Attention was probably directed to the horns as the seat of disease, because in all serious troubles there are times at which the extremities—the ears, horns and limbs—are cold, or alternately hot and cold. By boring, they were found to be hollow when it was supposed they should be solid, and it was, therefore, decided at once that they were the principal seat of the affection. Boring the horns causes intense pain, something similar to forcing a gimlet through the finger-nail, the tissues beneath, the bone and the flesh beyond it, and continuing till the skin is pierced on the opposite side; it cannot be defended from any point of view, and it is time for such treatment to be abolished in civilized and intelligent countries.

"WOLF-IN-THE-TAIL."

This trouble usually coexists with the so-called hollow-horn, and is equally without foundation as a cause of disease. I have space to devote but a few words to its consideration. Any one examining the tail of a healthy cow will find the bones, which are quite large at the root of the organ, gradually diminish in size till they finally disappear entirely when their place is supplied by a rather soft, flexible gristle. During any serious internal disease the circulation in the tail, as in other extremities, is lessened, and the part is consequently relaxed; there is even at times a slight dropsical infiltration which adds to the delusion and makes it no difficult matter for one to convince himself that some of the bones are really wanting. Their absence is then accounted for by supposing them to have been devoured by a hypothetical worm—the "wolf." This worm has never, to my knowledge, been discovered by a veterinarian, though it is not rare to find "cow leeches" who claim to have removed it. But even admitting the existence of such a parasite—which I am far from doing—it could not cause the *general* symptoms which are attributed to it; it might produce a local inflammation, of little consequence at the most, as we see with the larvæ of the œstrus which develop along the back of cattle, but no more.

The fact is, the ailments which I have mentioned are *imaginary* diseases—in the vast majority of cases they are merely symptoms of the real disease, but have no connection near or remote with its cause. It is time for farmers to recognize the fact that they are generally unable to discover the true disease; that they cannot trace its course or its complications; that it requires one with a thorough knowledge of the nature and effects of medicine, of the make-up of the animal body, and of the use and normal activity of every part of it, to be able to treat animals in a proper manner. It is time the usefulness of a veterinary profession was recognized; that efforts were made to provide competent practitioners for every section, and that these be called upon, as are human practitioners, at the first appearance of serious disease. When these points are appreciated, we shall see such cruel and unreasonable practices gradually give way—and instead of being killed in an effort to cure, the natural tendency to recovery will be assisted, and we cannot doubt that millions of dollars' worth of property would be saved in our country each year.

Industrial Societies.

THE MINNESOTA STATE FAIR.

ST. PAUL, Aug. 16th, 1873.

THE approaching exhibition of the Minnesota State Agricultural Society will be held at St. Paul the first week in September, and bids fair to be one of the largest and best fairs held in the West. The applications for space and kindred matters are so great as to keep Mr. Geo. R. Finch, the President, and R. C. Judson, the Secretary of the Society, busy almost day and night. The Premiums amount to $9,875 in cash, besides silver plate and medals. Competition is open to the world. The prospects of a large exhibit are promising. Geo. E. Brown of Ill., the Holstein breeder, T. L. Miller, of the same State, the Hereford breeder, Peter Davy, the Galloway breeder, and in fact, breeders of all noted stock will be ably represented, including sheep and swine.

The Purses offered amount to $14,500, which will undoubtedly attract a large number of fast horses. Rarus and Great Eastern have been engaged to trot during the week.

There is a large colony of English gentlemen in that State who have agreed to enliven the exercises by a series of English sports and games that will be exact imitations of the originals as seen in England, consisting of hurdle racing, fox chasing, steeple chasing, etc. Dr. Carver and Captain Bogardus, the greatest rifle and wing shots of the world, will display their skill during the Fair. A decided novelty will be Col. J. Bisshopp's stud of Shetland ponies, numbering some thirty or forty, which will be exhibited and driven before Rowan Chariots, four abreast, while A. H. Moore, of Dakota, will offer the opposite extreme in his trained Elk, that will be speeded before a trotting wagon. He will also show how the training of Elk for this purpose is accomplished. A patriotic feature will be "Old Abe" the Wisconson war eagle. He will be in custody of the veterans of Minnesota.

A new industry, the manufacture of Minnesota sugar, will be one of the sweetest things on the grounds. The importance of this industry has been suitably recognized by the erection of a building, containing machinery, where all may see and have explained the entire process, it being the desire of the managers to impress farmers practically with its importance.

The best breed of dogs will be displayed at the Bench-Show of the Minnesota Kennel Club, which has consented to hold its first exhibition on the grounds during the Fair. The dogs will be under the management of Mr. Chas. F. Lincoln, a gentleman well-known throughout the land, in connection with such displays. The bench-shows will close with a grand field-trial the following week.

The legitimate features of the Fair, such as grains, vegetables, woods, etc., will be supplemented by a similar exhibit grown upon the lines of the different railroads in the State, which will be an instructive showing for those contemplating immigration. The State Agricultural college will have a special display of its own.

Altogether the Fair this year promises to so far exceed former exhibitions as to be noteworthy in this respect alone, and the officers of the Society deserve the thanks of the community for their untiring efforts to accomplish the result. The customary arrangements with transportation companies for reduced fares and like details have been completed, and the Minnesotians may congratulate themselves on the prospect of a splendid exhibition. J.

ANNUAL MEETING OF THE NEW YORK STATE FARMERS' ALLIANCE.

THE Second Annual Meeting of the New York State Farmers' Alliance will be held at Association Hall, in Syracuse, commencing Wednesday, September 4, at 11 A. M. Reports from the Special Committees on Taxation, Transportation and Insurance will form an interesting feature of the occasion; and these, with discussions on recommendations they may offer, and addresses and debate upon topics of vital importance to the farming class, will make up the programme:

Any delegate from any Agricultural Society, Grange, Farmers' Club or other association of agriculturists in the State, is entitled to membership, on presentation of the proper credentials and payment of one dollar, and every such organization may send at least one delegate, or such number as shall not exceed three per cent. of its own membership. Several county alliances have been organized, and now enjoy full or partial representation. Only a few of the existing County Agricultural Societies are represented, and these but partially. But a small number of Granges are adequately represented. Those who believe in equitable taxation, just legislative representation, and equal statute rights, for farmers not less than for other classes of men, are earnestly urged to join in this movement, and to take such action as will secure to their respective localities full membership in this Alliance.

The time is ripe for successful opposition against monopoly and injustice; and to insure reformation of those abuses which the Alliance was organized to correct, we need only make prompt, and vigorous united effort, after wise counsel together.

A special meeting of the Executive Board will be held at the Temperance House, in Syracuse, Tuesday, Sept. 3d, at 11 A. M., and the several Special Committees are requested to be present thereat. HARRIS LEWIS, President.

A. A. HOPKINS, Secretary.

FAIRS.—There will be local fairs held under the auspices of the "South Kentucky Fair Ground Association," at Glasgow, Ky., October 1st–4th; Lamoille Co. Fair Ground Association, Morrisville, Vt., Sept. 17th and 18th; the Poultney Industrial Society, Poultney, Vt., September 17th–19th.

The Poultry Yard.

MODE OF EXTRACTING GAPE WORMS.

TAKE a low seat, hold the chick's feet tightly between your knees, with its head to your right hand; open its mouth, and with your right thumb and finger take hold of its tongue and draw it forward so as to bring the entrance to the wind-pipe so far forward that you can see the entrance plainly and get at it easily; pass your left hand on the off side of the patient, and place your left thumb on its tongue to keep it forward. The back part of the tongue forms a shoulder; placing the thumb on this enables the operator to hold it still, with the left forefinger under its lower mandible; the unoccupied fingers of the left hand can be placed behind the bird's head to prevent its pulling back. Have a stiffish feather—a secondary quill of a hen will do for chicks six or eight weeks old—regulated according to the size of the patient, but just stiff enough to prevent its doubling while it is being inserted. It must be stripped to within one-half or three-quarters of an inch of its end. To cut off the barbs close to the stem with the scissors, is the best way, as the stem often tears through if stripped by hand. Wet the tip end and twist it so that it forms a sharp point, and brush back the remaining barbs so as to form an arrow-head with the feathers.

When the chicken is held as described, you can see the wind-pipe opening and shutting; catch the opportunity while the wind-pipe is open and run down the feather as far as it will go without too much force, keeping the chick's head up and its throat extended up straight, so that the feather passes readily down. Make sure the feather is in the wind-pipe and not in the throat. When quite down commence to twist it sharply and draw it up slowly and it generally brings the worm or worms the first time.

Sometimes it is necessary to insert the feather a second time, but not often, as it disturbs the worms, so that the patient often coughs them out. The points to be remembered in this operation are: the preparation of the feather, the size to suit that of the chick, and the holding of the patient's tongue tightly, with the entrance to wind-pipe well forward and its head up, and neck up straight, to facilitate the operating of the feather. HENRY HALES.

DOG DAYS AND CHICKENS.

AUGUST is a trying month with most stock on a farm; the cows and horses are tormented with flies, pigs cannot keep cool, but chickens have a hard time in wet showery weather, when they often get wet. Even though the water is not cold, yet the continual drabbling from wet to hot sun, produces disorders of a malignant character. In a long-continued hot and wet spell, chickens do not find much convenience for dusting. And during such times lice are apt to increase fast. To remedy this, see that there is some dry corner, that is *kept* dry, with plenty of dust and sand in it. When the chickens take to it, put in some powdered sulphur, which will greatly assist in cleansing the birds.

Supply them with plenty of fresh drinking water, under the shade of a tree or something to protect it from the sun's rays. Neglect at this season often lays the foundation of disease. If birds are not kept in health and vigor now, they will not be worth much when they reach maturity; I have always found the success of the year greatly to depend on the condition of the young flock in August. H. H.

Miscellaneous

WHAT OTHERS SAY.

THE COLOR OF SOIL AND ITS TEMPERATURE.—Professor Wolley has recently undertaken a series of experiments upon the influence of the color of soil upon its temperature, the results of which are now published in a German paper and condensed by the London Farmer. Earlier investigation on the same point had already shown that in cold climates the development of plants whose growth requires a high degree of warmth, can be considerably encouraged by choosing a dark-colored soil, and that, on the other hand, a light-colored soil may be advantageously fixed on in extremely hot districts. Dard-colored soils not only become warm more quickly than those of a lighter hue, but they also appear to have the power of retaining the heat acquired from the sun for a longer time. Among these earlier observations may be noted that of Lampadius, who succeeded in bringing melons to perfection in the cooler months of the summer by strewing the soil with an inch-thick layer of charcoal powder; [Charcoal powder being one of the best of non-conductors of heat, its use over the surface of the ground would retard rather than promote maturity.—EDS.] and those of Girardin, who found that potatoes arrived at maturity sooner or later according to the darker or lighter color of the soil. In the new experiments of Wolley, cognizance is taken of the important influence upon temperature of the amount of water retained in the soil, and in order to exclude errors from this source, he operated on dry earth. The conclusions he arrived at are as follows:—1. During the warmer part of the year, dry earth, whose surface is dark-colored, is on the average warmer than light-colored soil. 2. The daily variations of temperature are greater under dark than under light soil. 3. The difference is most marked at the time of the daily maximum soil-temperature, and least marked at the time of minimum temperature. 4. The loss of heat at night goes on with greater absolute rapidity in dark-colored soil than in light, but the temperature does not sink to a lower point in the former than in the latter. 5. The differences of temperature between dark and light soil become less as the depth under the surface increases, and disappear altogether in the absence of sunshine, and at the colder seasons of the year.

GUINEA FOWLS are now being extolled for their destructive disposition towards the Colorado beetle. G. S. Scoville, of Hadley, N. Y., declares that they eat the Colorado beetles "as fast as other poultry eat corn," and that one Guinea hen will protect an acre of potatoes—which is giving the bird credit for large consumptive powers. These fowls also prey on other insect pests, lay more eggs than common poultry, and eggs unequaled for cakes, and, finally, are valuable as weather indicators, always setting up a terrible screeching just before a storm, and keeping it up until the storm bursts upon them. The Germantown Telegraph copying the above, adds: "They are good protectors against thieves, as they will always give the alarm of anyone approaching the premises they occupy. But woe to the little chicks they may encounter. Carefully guarded against as to these, the Guinea fowl, we should say, was valuable to the general farmer."

CRACKED clays and good wheat crops are concomitants, for the warm air is admitted deeply into the deep sub-soil, and evaporation from it is permitted, and it is a saving clause, even on undrained land. I can plunge my stick a yard deep down the cracks, 1½ to 3 inches wide at the surface, and they ramify in every direction. At the bottom of the cracks the point of the stick finds wet uncloven clay, and the wheat roots are there supplying the plant with moisture. The wheat roots descend 4 or 5 feet, as I have frequently witnessed.—*J. J. Mechi, in several English Journals.*

NITRATE OF SODA.—The mania for nitrate of soda will cause ultimate loss to many a farmer who is not aware that he should concurrently apply in the sub-soil plenty of phosphates. Its tendency to make crops look green and promising deludes many a farmer, who thus gets color and often mildew, instead of healthy increase. Its price will come down as rapidly as it has risen.—*J. J. Mechi.*

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY AUG 24, 1878.

WE offered, some time ago, to sell the cuts used in this Journal for ten cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

OUR CROP REPORTS.

It has long been a fashion with witlings and wiseacres to characterize farmers as immemorial grumblers, always loud in their complaints of bad crops, never willing to acknowledge good ones, and when forced to do so by an abundant harvest, forever lustily growling at low prices in an over-stocked market. Of this alleged tendency to discontent among the agricultural community, however, there is little trace in the long list of crop reports furnished us for publication in this issue by our farmer friends in every part of the country. Of the multitude of reports with which we have been kindly favored, lack of space permits us to insert here only such a selection as will give to our readers a fair idea of the condition of the harvests throughout the land. Moreover, a large number of reports from our friends in the distant Southern and Western States have only reached us either after our columns had been filled up, or too late for publication, even if from their importance we had been willing to displace other matter to make room for their insertion.

These notes, coming as they do, in nearly every instance, from actual tillers of the soil, show that, despite a few partial failures here and there, generally confined to only a single crop, the harvest throughout the country is, on the whole, an unprecedently good one. The perusal of the reports is gratifying, not only because of the widespread prosperity they indicate, but also on account of the hearty and often enthusiastic language in which that prosperity is acknowledged. The spirit of gladness and content that finds expression in such words is infectious through them, and inspires pleasure and satisfaction in the minds of all who read them.

Down to about the middle of July, the prospects of a large yield was better for spring than for winter wheat. Since then, however, storms in some places and the intense heat everywhere have so seriously damaged the former that, although about 2,000,000 more acres were sown to it this year than last, the total yield will probably not be any heavier, while some estimate it at considerably less. According to the reports of the Department of Agriculture, supplemented by those of the various State Boards of Agriculture, the area under winter wheat this year is at least 2,500,000 acres greater than last year. Moreover, while last year the yield was only 90, assuming 100 to be a fair good average, this year the yield is 101. In other words, where eleven and a-half bushels per acre were harvested in 1877, twelve and one-tenth bushels will be gathered in 1878. From the total acreage under spring and winter wheat, amounting, according to the latest estimates, to 34,000,000, a yield of 429,000,000 bushels is confidently expected.

Many agricultural journals in spring strenuously urged that potatoes should be planted early; but it seems that those planted late are nearly everywhere more promising than those put in sooner—a proof that even agricultural journals are not always infallible. Here, however, there is a plausible excuse for their mistake; for neither of them pretends to foretell the weather a month or two ahead, and the failure of the early planted potatoes is due more to weatherly influences than to any other cause.

From all appearances the corn crop will be extremely abundant; and as very little of this is exported in its natural condition, there will be a splendid opportunity to send it abroad at low rates of freight in the shape of juicy beef and fat pork. It is doubtful, too, whether there has been so excellent an opportunity of testing the comparative value of cornstalks as fodder as that presented this year by the extraordinary growth of the stalks reported from all over the country. It is to be hoped that the abundance of maize in all forms will not lead to carelessness or wastefulness in its use.

Of all fruits, peaches and grapes came off decidedly the worst from that rude encounter with Jack Frost last May. It is the part of a wise man to learn, from the experience of the past, lessons for the guidance of his conduct in the future; the past spring's experience therefore will give the shrewd fruit culturist many a useful hint for his treatment of grapes and peaches during the next season resembling the past—probably fifty years hence.

ALL THAT IS TO BE DONE!

SUPPOSE we succeed in doubling the yield of corn, wheat and other crops by intelligent culture and the application of improved methods of agriculture. That would be a triumph for "intelligent culture" and "improved methods." Suppose then that their value in the market falls to half its present value? That would not be satisfactory. The problem before us is to double the yield and to maintain the price. Then there ought not to be a grumble. If this could be effected with half the expenditure of labor and time that is at present required, that would be a triumph indeed. Then farmers would find plenty of time to read agricultural papers; interest themselves in farmers' clubs; participate in politics; dress in the latest style; adorn their door-yards; plant evergreen windbreaks; stop up all the cracks in their barns; wear smiling faces at home, and occasionally go abroad. Or they could investigate hog-cholera, pear-blight, grape-rot, how to exterminate insect-pests, and so on until nothing in particular is left to investigate except the new questions which arise out of the elevated condition of things.

Our really slow progress in agricultural matters has been due in a great measure to a *lack of time*. To give the first illustration that occurs to us—it is known from actual experiment that it requires but one-twentieth the time to "kill weeds before they are born," that it requires to exterminate them after they have grown "apace." Whence it follows that if after "weeds have grown apace" twenty days are needed to kill weeds—under the killing-them-before-they-are-born system, one day would suffice. It is plain that nineteen days would be left for stopping up the cracks in the barn; for traveling abroad; reading agricultural literature, etc., etc. Again, agricultural progress has been retarded by an absence of concerted effort. The effort has been made, but upon the principle of equal forces pulling in opposite directions. The result of this sort of effort simply lacerates the object upon which the forces are applied. In fact, many an object has been broken all to pieces by this sort of effort.

We must first settle upon a plan, and then harmoniously and vigorously pull together. The problem, as we see it after a careful perusal of all of our agricultural literature, is as we have stated: To double the yield of all crops and to maintain the price with half the expenditure of time and labor at present employed!

PEARL MILLET.

SOMETIME ago we spoke discouragingly of Pearl Millet. A considerable quantity was planted at the farm with unusual care and the seed did not germinate. That sown later at the Rural Grounds germinated readily, but after attaining a few inches in hight, remained stationary so long that we were ready to conclude it was not at all adapted to this climate. Since that time, however, it has made a surprising growth, some plants measuring seven feet in diameter—a thick mass of long green leaves and short-jointed stalks, that animals eat most greedily. Some plants were cut off June 26. They have continued to grow since, but rather feebly, and there seems at present little chance of this second growth being of much value.

The portrait we have seen of Pearl Millet does not represent the plant as it grows now. That gives its hight as at least twice its width, and is the portrait of a mature plant. Ours will measure more than twice as much in diameter as in hight. The stalks—of which there are over fifty to a single root—so crowd each other that they seem to be thrown over, the entire plant assuming a round form. It shows no signs of heading yet, and indeed has never, that we are aware of, seeded in so cold a climate. Our correspondent, Col. M. C. WELD, tested this plant while editor of "The Homestead," (Hartford, Ct.,) twenty years ago, and disseminated the seed for others to try. The reports were favorable, in view of which, as well as of the fact that it has been cultivated in some of the southern States for many years, it is singular that Pearl Millet, if worthy of it, has escaped general cultivation.

A POSITIVE CURE FOR GAPES.

Many are the remedies that have been recommended for the pestilential and fatal disease among chickens known as the gapes. It is the result of one or more worms in the windpipe of the sufferer, and the use of horsehair, twisted and inserted into the windpipe, is often spoken of, and also the use of feathers; but the great difficulty seems to be to get anything into the windpipe (not the throat), and successfully bring away the worms. Generally the worms could not be caught; besides the loss of time, the bungling with the patient more often killed than cured it. The positive remedy of which we have to speak, is essentially the same in theory, but rendered effectual by a difference in the *modus operandi*.

Mr. Peter Van Buskirk instructed our correspondent, Mr. Hales, who has communicated it to us. The trouble, however, is, that so much depends on precision in performing the operation that one must almost see it done, to be able to perform it successfully. Mr. Hales thought that Mr. Van Buskirk's description would be sufficient, but he tried many times without success, until he *saw* one chicken relieved, by his instructor. Since that time he has relieved many, which the neighbors around have taken to him. We do not presume that his description of the process on another page, will enable our readers to practice the method with any greater success than he attained from the instructions of Mr. Van Buskirk. We have given the process described by Mr. Hales, and are satisfied that it will be acceptable to many of our readers as a positive, simple cure, and if only one in a neighborhood hits on a successful performance of it from the description, it will accomplish good results, and lessen the difficulty of rearing chickens.

A NOVELTY INDEED!

We were asked by a friend one day last week to call at the salesrooms of Young & Elliot, of this city, to see a *blue* seedling Gladiolus. It was among an extensive collection of seedlings of this beautiful flower raised by Mr. C. L. Allen of Queens, L. I.

Seeing that our friend was in earnest, which we doubted at first, almost the same as if he had spoken of a blue rose, we hastened to the place of exhibition. The individual flowers of the spike were rather large and well opened, and the color of all the petals except the lower ones, was a uniform grayish-blue, or lavender, without streak or blotch. The lower ones were marked with a tongue of a deeper color, a deep blue inclining to violet. The upper part of the spike alone was exhibited—the flowers of the other half, left upon the flowering stalk, had been pollenated, in the hopes of securing seeds. It was the first bloom of the seed-corm, and we sincerely hope that Mr. Allen may succeed in raising a stock from this bulb, of which, however, there may well rest in his mind many a misgiving.

FRUIT CROP OF MICHIGAN.

As we are about to go to press, the following is received from Secretary Garfield:

Our apple crop in Michigan has been dropping badly, and the peach crop will be below the average. The Hale's are just going to market at remunerative prices. We never can overdo the fruit business in Michigan, with the great indefinite West to supply, and our very best apples can be shipped abroad with a good profit. We can have our Michigan Red Canadas, Greenings, Baldwins, and Spys, handled in London, at an expense of $1,50 per barrel, including freight and commission. We are thinking about sending over some specimens to Paris, for we understand that the people there are somewhat skeptical about the Iowa wax collection being modeled from real fruit. If we could get a barrel of our Grand Traverse apples there in good shape, it would soon dispel all skepticism in that direction.

Hastily yours,
C. W. G.

Professor Asa Gray.—"We are pleased to learn that at the last meeting of the French Academy of Science, held on July 29, Prof. Asa Gray, the well-known American botanist, was elected corresponding member of the botanical section of that learned body, by thirty-two votes out of forty. Mr. Charles Darwin, who was the other candidate, only polled five votes. Although, of course, we should have been glad if the honor had fallen on our own countryman, we most cordially congratulate Professor Asa Gray, on the well-earned distinction conferred on him, a sentiment in which we are perfectly sure that his unsuccessful rival will join most heartily. It will be seen by this, that if one wants to consider the feelings of all, and particularly those of M. Decaisne, and the gentlemen who compose the French Academy of Science, it is not well to do too much. Professor Gray, however, is also an indefatigable worker, in the cause of science." We take the above from the London Garden, of August 3.

BREVITIES.

EARLY potatoes are generally a failure.

J. J. MEOHI makes meat to grow wheat, and it answers his purpose.

AT the RURAL farm the corn crop, it is thought, promises the best yield, for twelve years at least.

THE space given this week to crop reports from different sections delays the publication of several timely articles.

MR. A. B. CRANDALL asks: "Has anybody (seedsmen possibly excepted) realized a comfortable profit from Prickly Comfrey?"

To see the beautiful plums now offered in our markets and fruit stores and stands, one would not suppose there was such an insect as the Curculio.

LE CULTIVATEUR assures us that a piece of paper, cut round and applied to the palate, will stop bleeding at the nose in 45 seconds. That's a simple remedy and the authority is good.

COMMISSIONER KILLEBREW says that the natural destiny of Tennessee is to feed the population of the cotton States and supply them with animals, and he thinks she will never realize the full wealth of her real estate and climate until grass and stock take the place of cotton and corn.

THE editor of the Michigan Farmer and Sec'y GARFIELD visited the grounds and buildings in process of erection for the State Fair. The editor concludes—"We came away well satisfied that the buildings were the best and the cheapest that have ever been prepared for the annual exhibition of the Michigan State Agricultural Society."

BOYDEN 30.—So far as we are enabled to judge of the new large varieties of Strawberries that have excited so much interest during the past two or three years, we would prefer Boyden 30 to any one of them. It needs good culture, certainly. So do the others. But it is sweeter than any of them—will average as large and bear handling or carriage just as well as any and better than most of them. We have observed, however, (it may be owing to local peculiarities), that its second is its best year.

Literary Miscellany.

TO HERMIONE.

WHAT shall I liken unto thee?
A lily bright,
Whose virgin purity and grace
Fulfils the soul, as doth thy face,
With all delight.

What shall I liken unto thee?
A blushing rose,
Which redolent of fragrance rare,
Half opened to the summer air,
All sweetness grows.

What shall I liken unto thee?
Some glorious star,
Which, hung aloft at eventide,
Sheds its mild radiance every side,
Both near and far.

No! such comparison is vain,
For these all three,
Lily, and star, and rose so fair,
In radiance, grace, and sweetness rare
Must yield to thee.

[*Macmillan's Magazine.*

EUPHROSYNE:

AN OLD TALE OF THE NEW WORLD.

CHAPTER II.

(Concluded from page 535.)

A CROWD had by this time gathered on the balcony, all eager to watch the coruscations of the aurora; and there were many who saw in them a shadowing forth of hosts gathered in battle—portentous of impending woe to the loyal garrison of Quebec. But no such superstitious fears paralyzed the courage of its brave defenders; and stanchest among them, and of firmest resolve to maintain the rocky stronghold against all odds, was the governor himself, the Comte de Frontenac, a gallant old noble, bred in the warlike school of Louis XIV., and a true believer in the great Henry of Navarre.

M. de Frontenac possessed the entire confidence of his sovereign, and it was his endeavor to deserve it, by wise administration and judicious policy. But though just, generous and brave, the comte's imperious temper often balked his good purpose; towards those, especially, who in any way thwarted his views, he displayed his strong feelings, becoming frequently so irascible that his most familiar friends dreaded to approach him.

In these dark and stormy moods, Madame de Lavasseur was the only one who could exorcise the evil spirit that possessed him. She was never moved even by his wildest tempests of passion; and if manifested in her presence, they seldom failed to subside into calmness when she tried her feminine magic. He delighted to have her near him: "She seemed," he said, "to surround him with an atmosphere of joy and peace;" and the dutiful and tender affection she rendered him in return for his fond indulgence, might have been that of a loving daughter. Louis St. Ours shared with Euphrosyne the favor of the stately comte—for, like most persons who are fond of power, he loved to have his favorites, though they were not always so well chosen as in the present instance. The young man being attached to the personal suite of the governor, occupied apartments in the castle, and was thus thrown into intimate association with Euphrosyne in the daily and hourly courtesies of domestic life—a dangerous position for the enamored Louis, especially as M. de Frontenac seemed in nowise displeased at the intimacy which was rapidly knitting the young people more closely together.

It was past midnight when St. Ours said adieu to Euphrosyne, and left the castle on a private mission to the intendant; and the yellow dawn was just tinging the horizon, when again he found himself alone in his chamber. Wearied, yet too much excited to feel the want of sleep, he opened a small cabinet which stood in his apartment, and drew forth his writing materials, desirous of improving the short time that remained before the sound of the morning reveille in inditing a letter to Madame Lavasseur—perhaps the last.

Full of manly tenderness was this letter, and as full of sad and bitter regret at the fate that forbade him to consecrate to her his life. All was told—all mystery cleared away from his words and conduct: his whole soul was laid open to her gaze, with its anguish, its deep remorse for the wrong he had done in seeking, even indirectly, to awake her tenderness.

The letter was sealed and addressed; and the half-hour that remained before being summoned to active duty, he employed in looking over the contents of the cabinet, which contained his private papers and other articles of value. Letter after letter was given to the flames; but several brief notes, bearing the signature of "Euphrosyne," and containing, it might be, some half-dozen lines of acknowledgment for a book or other trifling favor, were gazed upon till the delicate characters became dim, and then restored to the cabinet.

Unclosing a private drawer, which he had almost forgotten, Louis started at the sight of a miniature that had lain there undisturbed for years, though the rich gold of its setting was undimmed by time, and the gems that incrusted it remained as lustrous as ever. It was the picture of his child-wife, upon which he had never looked since the day of his fatal marriage, when it was given to him by her father. With an involuntary shudder of aversion he closed the drawer.

The dawn was slowly advancing, painting the cast with hues that cast their splendor on the mist which enshrouded the landscape. As the sun ascended, the veil lifted and flickered, hanging like a soft cloud over the St. Lawrence, and wrapping in aerial robes the snow-capped mountains of St. Charles. St. Ours stood silently watching the tissue of vapor, curling and wreathing itself into a thousand forms of fantastic beauty, till it floated slowly upward, when the English fleet, lying off the shore of Beauport, was revealed. Every stitch of canvas was furled, and the only sign of hostility presented was the red-cross flag of England, floating from the mast-head of the admiral's vessel.

The morning passed away; noon arrived, and just as the bell in the tower of Notre Dame proclaimed the hour of twelve, a boat, conveying an officer, with a flag of truce, shot from the side of the admiral's ship, and soon touched the pier at St. Roch's.

Springing on shore, the young officer, with a courteous salutation to the commander of the detachment waiting to receive him, requested to be conducted to the Comte de Frontenac, to whom he was the bearer of dispatches from Sir William Phipps. The consent of the governor being signified, he was blindfolded, and led up the steep rocky streets of the lower town, past frowning batteries, and through formidable rows of chevaux-de-frise, to the lofty platform on which stood the castle of St. Louis.

Admitted within its gates, he was conducted to the council-chamber, where M. de Frontenac, surrounded by high dignitaries of the church, and officers both civil and military, sat in state. An imposing audience, thought the young man, when his eyes were unbandaged, and he stood, the bearer of a haughty message, before that silent and dignified assembly.

The stern proud countenance of the imperious governor, one would have thought, was in itself enough to daunt the courage of any ordinary man under such circumstances; but the English herald, with a bearing as haughty as that of the aristocratic noble he confronted, advanced towards him, and with a stately obeisance, awaited his permission to unfold his errand. Slightly returning the stranger's greeting, the governor said in a brief and peremptory manner:

"Read on, sir, and you shall have our answer."

The Englishman drew forth his document, and read the bold summons of his admiral, demanding, in the name of his sovereign lord, William, king of England, the immediate surrender of the fortress and city of Quebec; "to which demand," added the imperturable messenger, "your answer, Comte de Frontenac, is required in an hour hence, upon the peril that will ensue. I shall await your excellency's answer till the time specified has expired."

By a simultaneous impulse, the whole assembly rose from their seats, surprised out of their dignity by the insolence of the message and the audacity of its bearer. Rage and astonishment were depicted on the countenance of M. de Frontenac. For a minute, excessive anger prevented his utterance, but when at last his white lips parted to speak, a torrent of scorn and defiance flowed from them. Shaking his clenched hand with a menacing gesture:

"I do not recognise the supremacy of William of England," he said; "I know him only as the Prince of Orange—a usurper, who, to gratify his selfish ambition, has outraged the most sacred rights of blood and of religion, striving to persuade the nation that he is its savior, and the defender of its faith, even while he has violated its laws, and overturned the Church of England. Those offences the divine justice will not long delay to punish as they merit."

Perfectly unmoved by this hurricane of wrath stood the messenger of Sir William Phipps, except that a haughtier light gleamed in his clear blue eye, and a scarcely perceptible curl of his lip showed his contempt for the accusation alleged against his sovereign. He only asked:

"This, then, is your excellency's only reply?"

M. de Frontenac deigned no word in return to the question, but, with an air of frigid determination, slightly bent his head in token of assent.

"May it please your excellency, then," resumed the officer, still in the same imperturbable and authorative tone, "to cause that this, your answer to our summons, should be rendered in writing, for the satisfaction of my commander, to whom I would not willingly bear a false interpretation of your message."

"I will answer your master, sir, by the mouth of my cannon!" thundered the exasperated governor, whose scarcely smothered wrath leaped into a flame at the audacious coolness of the herald. "Thus, and thus only will I hold parley with him, and that ere long; for it is time to teach him that the Comte de Frontenac, the vicegerent of the greatest monarch in the world, is not to be dealt with in this manner even by his peers!"

With a haughty wave of his hand, the angry old noble rose and left the council-chamber, attended by his suite. It was the signal for the herald's departure; and again, with bandaged eyes, he was conducted through the fortified city to the boat which had borne him on his fruitless mission thither.

The hostilities which almost immediately ensued on the conclusion of this brief conference, are matter of history; and upon them, even did the limits of our tale permit, we have no desire to dwell. Hour after hour, the dreadful cannonade continued; but directed, as was the fire of the English colonists, against the heights of the upper town, their balls fell harmless; while the numerous guns of the rocky fortress replied with a power that told fatally upon the enemy's flotilla. All day the fearful strife went on. But the weary day declined at last; twilight, brief and bright, came on; and then the welcome night, shrouding all things in darkness, and stilling for a time the desperate fight.

St. Ours hailed the approach of night with joy. All day he had been active where peril was rifest, and had escaped unscathed; but he was sick of the noise of battle, and even a brief respite was grateful to him. Another evening might not find him breathing—loving—on that earth made radiant by the presence of Euphrosyne; for there lay the black hulks of the hostile vessels, waiting for dawn to renew the strife; and among the victims marked for death, might not himself be numbered?

With this thought sprang up an intense desire to see Euphrosyne, if only for a few moments to learn how she had borne the trials of the day, and to draw comfort and courage from her smile. But he had been left for the night in command of one of the batteries of the lower town; and to forsake his post, even for an instant, was impossible. So, sadly resigning himself to the hard necessity, he stood dreamily gazing at the turrets of the castle, as they stood against the evening sky, and picturing to himself the beloved image which had never left him even in the perils of the fight. He was interrupted by a message from M. de Frontenac, who required his immediate attendance at the castle. He needed no second bidding to make him obey the summons, trusting that when he had received the comte's commands, he should be able to steal a short interview with Euphrosyne before quitting the castle.

He was detained but a few minutes by the governor, who desired to charge him with a secret mission to the commander of a distant redoubt; and as Louis passed from his presence, he made a slight detour, in order to traverse the corridor in which the private apartments of Madame de Lavasseur were situated. His heart beat high with the hope of meeting her; but the place was vacant; though, seeing the door of her boudoir stand partly open, he paused opposite to it, irresolute, yet fearing to enter unbidden. No light gleamed from within, and he ventured softly to breathe her name; but there was no answer; not a sound broke the deep silence; only a faint odor of the flowers she most loved stole balmily, like her own sweet presence, upon his senses.

A glass door at the end of the corridor stood open, and with a trembling undefined hope he passed through it to the balcony, and there he found the object of his search. With traces of emotion still lingering on her face, she lay upon a cushioned seat, the folds of her white garments falling gracefully around her, and her attitude one of profound repose. The moonbeams trembling through a fleecy cloud quivered on her face, their pale soft light seeming to surround her head with a halo, and thus lending a celestial character to her beauty.

St. Ours stole towards her, shrinking at the sound of his own step, yet drawing nearer till her low measured breathing fell softly upon his ear. It seemed as if she had wept herself to sleep, for tears were yet glistening on her cheek, round which her hair fell in disorder, descending in rich folds to the floor. Suddenly her sleep became disturbed; she moved, and murmured softly, but his ear caught the whispered words, and the blood bounded wildly through his veins. Could it be?—Yes, again she spoke; and his own name was on her lips—his father's name; that which he had borne since he became known to her was his mother's.

He bent again to listen—a smile was on her lips. She seemed visited with happy dreams; and stooping low to catch her inarticulate murmurs, he again heard "Louis de Mornay," coupled with another name which had been familiar to his childhood. He was amazed—how could she have come to the knowledge of this name? He wished she would awake, but she seemed sinking into a deeper slumber; and he felt that he must depart without the interchange of a word. Still he remained, as if spell-bound, bending over her till her breath fanned his cheek, when, yielding to a resistless impulse, he slightly pressed his lips upon her brow.

Light as was the touch of that impassioned kiss, it awoke her, and she sprang to her feet. In her terror, she failed to recognize him; she saw only a tall figure standing beside her; and with a bound, she rushed from him towards the door which opened from the corridor. Her dress was caught by some slight obstacle as she was passing through; and in her eager haste to disengage it, she cast a furtive glance at the intruder, when she was struck by a certain something in his air, and in the outline of his figure, which arrested her flight.

"Euphrosyne!" whispered the well-known voice. Glowing with joy she turned towards him. He advanced.

"You are safe, thank God!" she said; but the sound of a closing door, and then of voices approaching, alarmed her; and snatching her hand from his clasp, she darted swiftly away. Louis stood for a minute like one entranced; but he had no time to linger; and comforted by having seen her, he strove to persuade himself that it was better for her happiness and for his honor that he had been saved the expression of feelings, into which, had the interview been prolonged, he might have been betrayed. He left the castle, and departed swiftly on his mission.

HERMIONE.

The brief truce of the night was broken at early dawn by the guns of the enemy, who stung by the ill-fortune of the preceding day, renewed the assault. But though, for six continuous hours, they pressed the attack with vigor, they were at last compelled to retreat before the overwhelming power of their opponents. Many there were on the decks of the little flotilla who would have preferred dying in the struggle; but Sir William Phipps, no less brave than he was humane, wished to avoid a useless waste of life, and assured that all chance of victory was at an end, he ordered the anchors to be weighed; and crippled by the guns of the fortress, many of her gallant hearts cold and silent, others bleeding on her decks, the defeated armament floated slowly down the stream.

Fast and continuous from the height of the citadel pouring on the retiring fleet the fire of its cannon; scarcely a ball sped through the air in vain; and when at last one of them, in its flight struck the mast of the admiral's vessel, and sent it headlong, with the proud flag of England at its top, into the St. Lawrence, what humiliation crushed the hearts of its defenders!—what joy swelled the triumph of the victors!

Borne up by its silken folds, the flag floated slowly towards the conquerors—a token of surrender, which they hailed with shouts that shook the city to its center. On it came, watched with breathless interest by that eager multitude, till suddenly, saturated by the waves, it disappeared beneath them, the end of the splintered flagstaff floating on the surface, designating the place where it had sunk. The breathless hush which succeeded its immersion, was broken by the clear commanding voice of de Frontenac impetuously exclaiming:

"Shall the trophy be lost to us, an

not an arm among the hundreds here outstretched to pluck it from the waves?"

"Heaven forbid!" shouted Louis St. Ours; and with the words he cast aside his coat and sword, and leaping from the bank, dashed out into the stream. The welkin rang with enthusiastic cheers; and many a one who had shrank from the peril, now envied the young man who had dared it the glory of the act.

The retreating foe were still near enough to mark the proceedings on shore; and hoping to rescue their fallen flag from the grasp of the victors, they renewed their slackened fire. But regardless of danger, though the balls fell fast around him, St. Ours pressed on. The throng upon the shore watched his progress in profound silence; but when he safely neared the flagstaff, and grasping it, held up the flag, a burst of gratulation, long and deafening, greeted his triumph, and was again renewed, and yet again, as he swam back with the trophy to the shore. Leaping up the bank, he laid it with a proudly throbbing heart, at the feet of M. de Frontenac.

Surrounded by his staff, the old noble stood upon the highest point of the bank, watching the scene with intense interest. A smile at its gallant issue lit up the veteran's haughty face softening its stern expression, and revealing by its sunshine the kindness which really formed a part of his character, though too often obscured by the arbitrary manner which his love of rule had fostered. Bending courteously towards St. Ours:

"Well and bravely done, young sir!" said he—"well and bravely! the crowning act of a heroic day! On the spot which has witnessed your valor, it is fitting that, in my sovereign's name, I decree you the guerdon it deserves. Kneel down, Louis St. Ours!"—and drawing his sword from its scabbard, he held the glittering blade, flashing in the sunlight, over the young man's head for a moment, then laying it upon his shoulder—"Rise, Baron de Mornay!" he exclaimed; "and be thou fortunate in love, as thou hast this day shewn thyself valiant in arms, and loyal to the service of thy king!"

At these words the new-made baron rose, flushed and excited, pleased by the approbation of his commander, and the approbation accorded him; but above all mystified and astonished at being accosted by the paternal name he had so long disused as the symbol of his legal bondage. Twice within the last few hours he had heard it repeated by those to whom he had never been known as other than Louis St. Ours; and now he was rebaptized with his family name, dignified with a lordly title.

The city that night presented a scene of rejoicing, except where, here and there, a closed dwelling told of the desolation which the brief combat had brought into it. A banquet at the castle celebrated the victory of the garrison; and conspicuous among the adornments of the grand saloon, hung the English flag, dividing the attention of the guests with the youthful hero, who, at the peril of his life, had snatched it from the waves. Euphrosyne looked the very incarnation of happiness. Never before had she so plainly manifested her preference; it seemed as if she designed to convince him of it, and that so undisguisedly, that even while his heart struggled between the joy and anguish which the certainty of her love brought with it, he was half inclined to censure its almost triumphant demonstration.

More painfully than ever came home to him his hopeless bondage—his hateful obligations to another; and reproaching himself that he had so long tacitly permitted the growth of her affection, he resolved that very evening, even while her hand held the cup of happiness to his lips, to turn from it, and reveal to her his true position. With this purpose he turned to seek her; but not finding her among the crowd, he strayed on towards a small apartment, whose glass-doors opened upon the terrace, which, at that hour, he thought to find untenanted, and where he could collect himself for the interview he sought.

With downcast eyes, and arms folded across his breast, the very impersonation of melancholy musing, Louis entered the apartment; but as he slowly crossed its threshold, a murmur of voices startled him, and raising his eyes, he saw, seated in a high-backed Gothic chair, surmounted by his own arms, the Comte de Frontenac, while beside him stood Euphrosyne, one arm thrown caressingly round his neck, and her fair face, a very April-face, with its mingled smiles and tears, half-hidden on his shoulder. Entranced by the unexpected sight, yet retaining a dim consciousness of intrusion, Louis mechanically turned to retreat, when the voice of the governor arrested his steps.

"Nay, do not quit us, Baron de Mornay," he cried. "There surely is an unseen Power that directs our actions, or you would not have been drawn hither at so apropos a moment. Come and tell me what shall be done to the man whom we delight to honor! I feel that I have but poorly acknowledged your chivalrous conduct by the bestowal of an empty title; and now I would signalize my sense of your brave and gallant bearing, by enriching you with a gift, priceless above rubies, if—as the young believe—the heart's affection is more to be coveted than worldly wealth and honors—Euphrosyne!"

She did not answer to his call, but kneeling in silence beside him, strove with her small hands to cover her blushing face, as it rested on his knee. The comte turned his eyes from her with a smile, and again addressed St. Ours:

"Young man, I knew your father, and loved him; and so loving him, rejoice that he has left such a son to honor his memory, and bear up his ancient name; and being such a one, I not unwillingly intrust to your keeping the happiness of my child, my Euphrosyne—mine by adoption, the precious gift of a sister whom I shall never cease to mourn."

There was a breathless pause: the young man's tongue clave to the roof of his mouth—his heart seemed to cease its pulsations; he stood for a minute as if transformed to marble, then roused by an overpowering rush of agony, he rapidly traversed the apartment. It was a moment of terrible suffering; he could not bear it long; and suddenly nerving himself to the act, he paused before the chair of M. de Frontenac, and raised his eyes to read a sentence of wrath and banishment in that despotic face, but instead thereof, he saw an expression of kindness, softening the eagle glance of the veteran, such as he had never witnessed there before.

A mist obscured his sight, and dimly through it he saw the still kneeling figure of Euphrosyne, her face bowed down and hidden in her hands; and impulsively he cast himself beside her, breathing out in broken sentences his love and his despair, rapidly detailing the history of his early and forced marriage, and deploring with passionate eloquence the relentless destiny that crushed from his heart the hope dearest to it on earth.

"This is a strange story, forsooth," said the comte in a tone that sounded mockingly to the diseased sense of the unhappy lover. "Euphrosyne, my bird, heard you ever the like of it?"

"Ay, almost the same, dear uncle," she said, raising her lovely face, now so radiant with happiness that the young baron, almost indignant, gazed fixedly upon her for a moment, half ready to believe himself the dupe of some concerted jest.

"The same, say you!—pray, how so?" questioned the comte.

"List if it be not," she answered. "A story of a maiden wedded in her childhood, left unclaimed, forsaken by her perjured lord, whose pictured face only kept alive her remembrance, ay, and nourished her affection till they met again; and now——" The words faltered on her lips, as, with a trembling hand, she unclasped a chain of gold from her neck, and held the miniature suspended from it towards him, bending down, hid her blushing face from his gaze.

He took it eagerly, and pressing the spring, disclosed the likeness of a youth, beautiful as Adonis; yet, was it not—could it be a transcript of his own boyish features! It was a strange bewildering thought, nor would he have yielded to the conviction of its truth, had it not been forced upon him beyond a doubt by his own name engraved upon the case. Yet even that evidence seemed insufficient, for he held it up in the strong light of the hanging lamp, reading with fixed gaze the name Louis de Mornay clearly cut upon the gold.

"Rosyne!" he cried, catching her impetuously in his arms—"Rosyne—Rosyne de Lancey! she whom I have wronged, and shunned, and hated! Can it be that she and the beautiful Euphrosyne, the day-star of my life, are one—the same? If this is true, will not she to whom I have been so unjust show mercy, and let the sufferings I have but feebly pictured atone for the fatal error of the past?" Looking up with a smile of trusting love, she replied:

"It is forgotten, now—forgotten dearest Louis, The joyful reunion of this moment seals and sanctifies the empty vows of our childhood. Henceforth, let us live for God, who has so blessed us, and for each other."

"Ah, take her, my young gallant; and make her what amends you can for your past folly and neglect," said M. de Frontenac in a tone of unwonted emotion. "For years she has been my precious charge, and for her sake I have marked your course, and at last brought you to my side, that in case I found you worthy of my peerless little blossom, a happy denouement might crown your melancholy romance. The name she bears is an assumed one, of course—for with that marriage-symbol on her finger, which I could never prevail on her to lay aside, it was not meet to deprive her of her matronly dignity. And now I will leave you to mutual explanations; our guests are dispersing, and a few hours still remain before the morrow summons us to sterner duties. Be well assured that you are satisfied with each other, else it will be easy for the church to undo the knot which affection has never rivetted. But if all is right and true in your hearts, we will have you re-married on the same day that we chant a Te Deum for the victory which has chased the invaders from our shores."

A bland smile brightened his face for a moment, then turning away, he left them to their happiness.—*Chamber's Miscellany.*

CATARINA CORNARO'S ABDICATION.

THE island of Cyprus, always an object of interest to the scholar, has become "popularly" attractive since its incorporation into the British Empire; everything which throws any light on its history, progress, peculiarities of soil or climate, is eagerly read. Catarina Cornaro, in Harpers for September, (from which we make following extracts) is a most entertaining and instructive addition to the fund of Cyprus information:—

The queen sat unshaken and erect upon her tottering throne, and turned a deaf ear to all the insinuations of the senate. The kingdom was her own, the people her subjects, and so long as one heart remained loyal to her she would find strength to shield it against the craft of her mother-state. The senate, finding that this soft tool of theirs had hardened to toughest steel in the stormy years of her reign, had recourse to open negotiation. They sent the queen's brother, Giorgio Cornaro, to the island to demand of her, in the name of the republic, to yield up her kingdom. To this proposal the queen proudly replied that she was astonished beyond measure at the charge the reverend senators brought against her of having allowed the sceptre to slip from her hands; that she had been too long accustomed to the splendor of a court to live at ease in the simple state of a private gentlewoman; that her strength had already been tried, and was able to meet whatever new misfortune might overtake her; that she had never known much of happiness, for her husband had died very early, and the sweetness of motherhood had been hers but a little space; her relations had been murdered before her eyes; the revolt of her vassals, the intrigues of her court, had familiarized her with danger in all its forms. She demanded of her brother, the state's ambassador, how he could have so little regard for the honor of their name as to ask of her a deed that would blacken it in the eyes of all posterity. She had resolved never to marry, and thus at her death the crown of Cyprus would revert to the republic. Until then the noble senators might wait.

This answer, with all its defiant strength and queenly dignity, flung at the feet of the Venetian senators, filled them with the surprise that one might feel who should watch a gazelle at its gambols, and returning in the morning find it transformed into a tigress.

The senate replied to the queen in an indignant strain. Catarina asked for the time to deliberate, and loud and angry were the discussions between herself and her brother. He was the only member of her family for whom she felt any affection, and the senate had remembered this when it chose him for its ambassador. The covert menace, the lurking insult of the senate's protest, showed Catrina what she had to expect from those tender nurturers of her youth. The threat of force which crouched behind the courtly phrases revealed the dread Venetian tribunal in all its hideousness. But resistance meant ruin and desolation to her people. If the senate withdrew its support, the barbarian hordes would rush down upon the helpless Cyprus and tear it limb from limb. If she threw down the gauntlet to the Venetians, their fleet would in a moment surround the island and take it by storm. Every outlet was closed, every avenue of escape walled up by the crafty senate. It was only the sacrifice of her own pride that was demanded, and she was a widow without a child. A few short years and all would be over, and should she make other wives widows and other mothers childless by fighting for her crown? The woman's heart was stronger within her than the sovereign's pride.

She avoided all direct mention of the Venetian coercoin. "Too well I see how fleeting was the show of happiness with which Fortune sought to tempt me in my first youth, for I have received nothing at her hands but grief and disappointment. Thus I renounce the pomps and the ambitions of the world as I renounce my kingdom. Never again will happiness enter my life. I see too clearly the uncertainty and the futility of earthly circumstance. I give my thoughts and my soul to God, imploring Him to grant me His grace in return for the sacrifice of my kingdom."

The news of the queen's abdication and return to her native land spread throughout Cyprus. The people followed her in procession to Famagusta with shouts of clamorous applause and demonstrations of regret. The people loved her deeply and truly, for they knew her to be a Cypriote at heart through her love for the dead king. In Famagusta the Venetian general offered her the dispatch from the senate. But she answered that she was disposed to obey the state blindly, only praying it to have at heart the happiness of her kingdom, for although her body was about to leave it, her soul would remain. A council was held, in which the queen made a formal renunciation of her rights, the island magistrates took the oath of allegiance to the republic, and after a solemn mass the standard of St. Mark was consigned by the queen to the Venetian general, who caused it to be reared aloft in the market-place of the city.

A few months later (A. D. 1489) the queen took her departure. Crowds followed her to the shore. Mothers held up their children that they might look upon the last of the sovereigns of Cyprus. The old proud line of Lusignan had been swept from the earth, and the storm-ridden island which had held its own for so many years was now but a vassal of the arrogant republic.

HEALTHFULNESS OF FRUIT.

No intelligent person can doubt that the free use of ripe fruit is conducive to health. On the other hand, it is obvious that fruits as an exclusive article of diet do not meet all the wants of the system. The chemistry of the apple, the pear, the tomato, the grape, etc., is well understood, and it can be stated how much nutriment or assimilable food each is capable of affording; but this does not answer all the questions connected with the subject of the healthfulness of fruit. Besides furnishing nutriment, fruit exerts other influences upon the animal economy of the highest importance. The acids of fruit are not properly nutritive substances, but they produce physiological effects of a cooling or corrective nature which are highly salutary.

Fruits are largely composed of water, and this fluid has come to them through extraodinary channels. The tiny root-fibres have collected it in the dark earth, and by vital action it has been forced through the most minute tubes, until it is finally deposited in the fruit cells. So far as we know, the water undergoes no modifications; it is water in the soil, and it is the same in its wonderful associations in fruits. It however holds saccharine elements and other principles which modify its physical appearance and taste. The great amount of water contained in fruits is in itself an advantage, as it aids in cleaning the alimentary canal and the other excretory ducts, and thus promotes healthy action.

Fruits are capable of sustaining life for long periods, but the lack of the nitrogenous elements detracts from their strength-giving power, and any one living exclusively upon them would not be able to labor effectively. We have heard of the man who rowed his boat along the entire coast of New England, sustained alone by wortleberries; but if the voyage had lasted six months, or even three, his nerves and muscles would have entirely failed him.

The past year was a season of abundant fruits. Perhaps never in the history of the Northern and Eastern States were apples more plentiful. We were glad to sell the products of our orchards at about twenty cents a bushel. The present season promises as good. The rich and the poor can indulge in this noble fruit, to the greatest possible extent, at small cost. If the fruit is largely consumed, in connection with a proper proportion of animal or nitrogenous foods, a much higher standard of health will be attained among all classes.—*Boston Journal of Chemistry.*

AMONG the fountains in Brussels there is none that commands such attention of the stranger as the diminutive figure called Le Manneckin, and there is none that is held in such reverence by the people of Brussels. It is a droll curiosity, whilst, at the same time, it is a true picture of innocence and nature. He stands on his pedestal showing by his countenance that he is oblivious of the fact that he is surrounded by spectators and that some of them glance at him from behind their fans. It is the figure of a hearty and robust little boy, about five years of age, standing on a pedestal over a half-circle basin, and as he has been frequently stolen or defaced, an ornamental iron railing incloses both the basin and the statue. But Le Manneckin is a historical character, and he has stood for four hundred years in his present position. The first statue was in stone, but 260 years ago it was replaced by the present bronze figure by Duquesney. There are various legends in connection with it, the best accepted of which is that the son of a distinguished man had been lost for some time, having strayed away. This part of Brussels was then a thicket, and it was on the spot that the fountain was subsequently erected by his father that he was found, after diligent search, just in the position and in the act which the statue represents. In gratitude for his recovery the fountain was erected, and has stood during all the vissitudes of war and changes of government. It has been from time immemorial an object of popular affection. On grand holidays it has always been the custom of Le Manneckin to wear a costume, and an officer is regularly appointed and paid by City Council of Brussels, whose duty is to dress him on these occasions and to keep him in repair and in running order. When Louis XV. captured Brussels 1747 he wore a large white cockade on his hat. In 1789 he was dressed out in colors of the Brabancon revolutionists, and the empire girded him with the French tri-color under Napoleon. The Dutch Government imposed the orange colors upon him. The days of September beheld him dressed in a blouse, and under the present reign, on grand occasions, he proudly wears the tunic of the civil guard. This little inanimate figure has been the object of several bequests, from which some ideas of the sentiment of the people of Brussels in relation to him may be judged. The object of these bequests was to furnish a fund, not only to furntsh him with dresses for fetes, but also to keep the fountain in good order, and repair and renew it when necessary. This is the fund which the city administers, and which pays for his chamberlain.—[Cor. Baltimore American.

THE FIRST FINGER-RING.—An amusing myth is told of the origin of the finger-ring. When Jove released Prometheus from the bonds by which he had been confined, he condemned him, as a sort of penance—perhaps somewhat after the fashion of a modern ticket-of-leave—to wear upon his finger as a ring a link of the iron chain that bound him to the Caucasian rock, in which was set a fragment of that rock itself. In this way, so fable goes, the custom of the finger-ring originated. There is every reason to believe that this use of the engraved stone began with the Greeks, and from them was copied by their servile imitators, the Romans. It is every way a convenient and natural one, and our grandfather's custom of wearing their seals at the fob, as it was called, or hanging from the side-pocket, was a recurrence to old Assyrian usages, which did not long hold its ground.

AN EXPENSIVE BOARDER.—The elephant, a large one, kept at the Zoological Gardens of London, seems to be a pretty hearty feeder. His daily food consists of four hundred pounds of hay and three bushels of oats. He washes this enormous quantity of provender down his throat with *four barrels of water*. Besides all this, he thankfully receives candles, cakes, apples, and such small trifles, from the visitors.

RECENT LITERATURE.

HENRY GREVILLE'S new book, and most dramatic and most powerful novel, and the one that established her fame in Europe, is "SAVELI'S EXPIATION," now in press and to be published in a few days by T. B. Peterson & Brothers, Philadelphia. It is a faithful portrayal of Russian despotism in the time of serfdom; and although the character on which the plot rests is strongly drawn, it is not overdrawn, but is true to the times and situation, for the pictures of Russian life are drawn in a manner which could only have been acquired through actual observation and experience. Powerful as it is, it is free from exaggeration, while a pathetic, tender love story is presented for relief. This novel shows more power and wonderful concentration than any the author has written; the descriptions are so vivid, and the characters and surroundings presented with such clearness and strength, that one is carried to the very scene and feels the atmosphere. Henry Greville, indeed, is a charming and exquisite writer. It will be issued in uniform style and price with "Theo," "Kathleen," "Gabrielle," and "Miss Crespigny," published by the same firm.

BRIC-A-BRAC.

WHO?

WHO ever read a swallow tale
Or wore a coat of arms?
Who ever saw the water pale,
Or give great falls alarms?
Who?

Who ever rode a wild saw horse,
Or over heard sand's tone?
Who ever saw the sun's rays course,
Or heard a pane full grown?
Phew!
[*Hackensack Republican.*

Who ever saw a door a-jar,
Or heard an oak lin-tel?
How many naves were in a church,
Beside the organ "swell?"
Who?

Who ever saw a black-king box,
Or carpenter Gim-let?
His neighbor's Bantam hatchets eggs,
Within a nail claw set?
Few! [*New York News.*

Whoever saw Anemone
Love a Lamprey-kin?
Or, who would a bumble-bee
And basque in muslin thin?
Who?

IMITATION TORTOISE SHELL AND MOTHER-OF-PEARL.

TORTOISE shell, the product of the shield of a species of sea-turtle, has long been in favor for the manufacture of ladies' hair-combs and the like. The richness of its color and the beauty of its markings account for this. But it is valuable, therefore beyond the reach of many a purse. It is long since imitation combs, made of horn and stained, and presenting a tolerably fair resemblance to the original, were provided to meet the requirements of the fair sex. We have now to direct attention to another simple method of getting up a "shell." On a piece of glass there is placed a layer of clear gelatine, on which the distinctive marking of the tortoise shell are obtained by dotting it with a concentrated solution of an aniline color named "vesuvin," to which a beautiful reddish tint may be given with "fox-in," another aniline color. The solution may also be scattered over the surface, and the drops allowed to run together. The whole when dry receives a coat of glue.

Mother-of-pearl, which is procured from the shells of large mullusks found in tropical seas, can also be imitated somewhat readily, though the process is more difficult. On a piece of glass place a gelatine layer containing a concentrated solution of some salt, such as white vitriol, Epsom salts, etc. When this salt solution has dried and become crystallized, a solution of so-called pearls is spread over the whole. This latter material is derived from the very fine and silver-like "sounds" or air-bladders of fish, which possess considerable iridescence. When the gelatine layer thus treated has dried, a coat of glue is applied, and the article is finished.—*Cassell's Magazine.*

WE love to lie beneath the shade
And quaff the cooling lemonade:
We love to feel the cheerful ants
Crawl calmly up our summer pants:
We love to see the appleworm
Prone on our shirt front squeam and squirm:
We love to watch with placid eye
The doodlebug go tumbling by:
We love to hear in distant bogs
The rueful rumbling of the frogs:
We love to hear the slimy snake
Wind in and out the verdant brake:
We love to hear the crispy cry
Of bumble-bees bumb-bumbling by:
We love to scent upon the air
The balm of squashbugs balming there:
With ivy trailing all the land,
And poison oak on every hand,
Far from the city's dusky strife,
How sweet to lead a rural life! [*A. Tennyson.*

WHAT "EASTLAKE" FURNITURE IS.

ALTHOUGH the archæology of Mr. Eastlake's volume is not always careful, most of the principles that he enunciates in it are beyond question and can be generally stated in a few words. He would have no carving or mounting or other ornament glued on—such work must be done in the solid; he would have no mitred joints made of the right angle and secured by mortise, tenon and pin; he would have woods in their native color and unvarnished, or else painted in flat color, with a contrasting line and a stencilled ornament at the angles; he would have unconcealed construction everywhere, and purposes plainly proclaimed; and he would have veneering, round corners, and all curves weakening the grain of the wood absolutely forbidden. The furniture that he thus proposes has straight, strong, squarely cut members equal to their intention. Its ornaments are painted panels, porcelain plaques and tiles, metal trimmings and conventionalized carvings in sunk relief, a part of the construction entering into the ornament, also in the shape of narrow striated strips of wood radiating in opposite lines, after a fashion not altogether unknown in the time of Henry III. It has the honesty and solidity but not the attraction, of the Mediæval; and if it is stiff and somewhat heavy, and fails entirely to please, it has yet a wholesome and healthy air.

TIME.

FORENOON, and afternoon, and night! Forenoon,
And afternoon, and night! Forenoon, and—
What? The empty song repeats itself. No more?
Yes, that is life. Make this forenoon sublime,
This afternoon a psalm, this night a prayer,
And Time is conquered, and thy crown is won.
[*Edward R. Sill.*

BIRDS are entitled to justice. When a man is indulging in a frolic, to say he "out on a lark" is a libel on that bird. He is really out on a swallow.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

CHERISH THY MOTHER.

BE gentle to thy mother; long she bore
Thy infant freshness and thy silly youth:
Nor rudely scorn the faithful voice that o'er
The cradle pray'd, and taught thy lispings truth,
Yes, she is old; yet on thine adult brow
She looks and claims thee as her own e'en now.

Uphold thy mother; close to her warm heart
She carried, fed thee, lull'd thee to thy rest,
Then taught thy tottering limbs their untried art,
Exulting in the fledgling from her nest:
And now her steps are feeble, be her stay,
Whose strength was thine in thy most feeble day.

Cherish thy mother; brief perchance the time
May be that she will claim the care she gave;
Past are her hopes of youth, her harvest prime
Of joy on earth; her friends are in the grave;
But for her children, she could lay her head
Gladly to rest among her precious dead.

Be tender to thy mother; words unkind,
Or light neglect from thee, will give a pang
To that fond bosom, where thou art enshrined
In love unutterable, more than fang
Of venom'd serpent. Wound not that strong trust,
As thou wouldst hope for peace when she is dust.

O mother mine! God grant I ne'er forget,
Whatever be my grief, or what my joy,
The unmeasured unextinguishable debt
I owe thy love; but wake my sweet employ
Ever through thy remaining days to be
To thee as faithful as thou wert to me.
[*Geo. W. Bethune.*

THE DEGENERACY OF WOMEN.

WHAT I desire to draw attention to is not weakness of intellect, unfeminine habits or tastes, or any impropriety of conduct. Far from it. I lament the general physical weakness, the lack of stamina and force in the "well to do" portion of the sex, and if it is in my power to do or say anything to check this growing evil, or to enable women to overcome this physical defect. I feel bound in duty to say and do it, asking only that I may be credited with sincerity of purpose.

A very pertinent question is, what is the cause of it? The girls and the young matrons of half a century ago were, as a rule, healthy and strong, and without any lack of feminine graces. They possessed a due proportion, as compared with their brothers, of force, strength and agility, and the physical differences between the sexes were the same in man as in the lower animals, the male being the superior in size and strength of muscle, while the female exceeded in agility and grace of motion, with no disparagement of vigor or bodily health. But now when half a century has passed, how is it? I need hardly answer the question; the majority of women under fifty are unhealthy and unfitted for the duties of life. What shall we do? Let us seek for the cause. It is customary to charge the fault to tight lacing. This fashion has, or has had its votaries, and no doubt the grave now covers its many martyrs; but this is not all; the human body is full of muscles designed by our maker for use, and if used properly they increase in size and strength; if allowed to remain idle they fail to develop, and shrink away, and their attendant tendons and their attachments to the bones become powerless. Instead then, of that sprightly and joyful activity which, in nature, characterizes the young of all mammals, there will be debility, languor, listlessness, impotence, premature old age and death; and in proportion as all these organs are disused, and their intended use perverted or neglected, in that proportion do all these results follow.

I wish to treat this subject in all fairness; men have their follies and imprudences, and suffer for them, but I do not design the discussion of their shortcomings for this chapter. It is one of the great faults of the age that mental development is crowding out the equally essential physical; parents and teachers seem to ignore the fact that a sound, strong and healthy mind cannot inhabit a weak, unhealthful body.

It has always been my opinion that the great prevalence of pulmonary and abdominal complaints and the general muscular weakness of the women of the present age are due mainly to the neglect of physical culture in early life.

Fashion in dress and behavior is the greatest tyrant on earth, and she who will not conform to its demands loses caste with her peers. Boys of ten years may run and jump, and they pride themselves on their fleetness, agility and strength, but girls of that age are not permitted to indulge in such masculine pastimes, for neither their mothers nor Mrs. Grundy will allow it. Boys thus develop and strengthen muscle, tendon, bones and lungs, but how is it with the girls? It is true that in country places and backwoods districts girl nature will assert its rights, but such girls when grown to womanhood and motherhood need no hygienic advice from me, and it is not for them that I write. The Creator has given to all an excess of physical force over and above the ordinary wants of the animal; this is brought into use on extraordinary occasions; the boy prepares himself for these extreme cases by athletic competitions with his fellows; it is a pity the girl is not allowed to do the same. Abdominal weakness amounting often to a displacement of some internal organ, is an almost universal complaint among women, and to reach the cause of this great evil, let us consider a few facts on the design and use of the muscles. If we decide to perform any muscular act, the muscles that need to be brought into play in its performance involuntarily prepare themselves, or hold themselves in readiness for it. If, in walking in the dark, we accidentally step down a few inches, it produces considerable of a shock, when, if we had seen the depression in our path, the same step would have been taken with perfect ease. In sitting, the abdominal muscles are relaxed and nearly idle, but when we rise to walk there is a tension of them that can be felt by pressing the hand upon them. The tension and exercise of these muscles in standing and walking is what a great share of the women in what are called "easy circumstances," lack, and these muscles especially, as well (as all others incidentally,) suffer or fail to obtain necessary tone and vigor to meet those emergencies to which all are liable. A lack of natural force is induced by early restrictions in exercise; a lack of tone and an aversion to muscular action in womanhood is the result, and ever after they never stand, walk or breathe enough to bring up and to keep the body in that vigor which is their natural birthright.

There is much more that might be said on this head, but I am reminded that brevity is more effectual than verbosity, and should the spirit move me again, and the mercury go down a few degrees, I may resume. S. B. P.

BARREL CHAIRS.

MANY articles of real utility may be fashioned out of abandoned material that is in everyone's way. We remember one ingenious family whose success at converting such flotsam into pretty serviceable things was the admiration and despair of imitating friends.

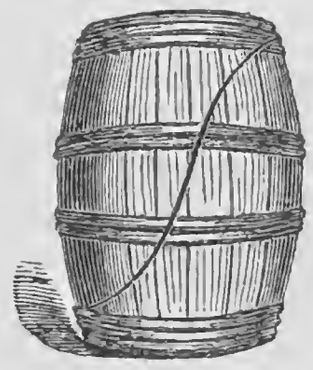

FIG. 1.

The disreputable barrels that have served their original purposes and are about to become unsightly obstructions to back-yard travel, are excellent subjects for an illustration of the use of refuse. We give three cuts, showing how one of these barrels may be converted into a comfortable rocking-chair.

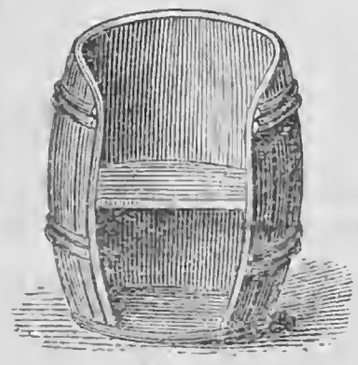

FIG. 2.

Fig. 1 is the barrel outlined the way it should be cut, and Fig. 2 shows how the seat is to be placed; while Fig. 3 gives a plain view of the manner of adding the rockers. It only remains to pad and cover the chair, and brighten up the rockers with a bit of color.

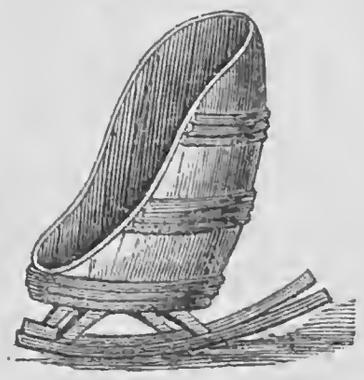

FIG. 3.

Some one of the charming patterns in cretone that are now so cheap is the prettiest covering that could be used. The details will depend greatly on the taste of the amateur upholsterer, but with only a scintilla of "knack" the article can be made to grace even a sitting-room, and is delightful as an easy chair on the veranda, or in the bed-room.

"I SUFFER NOT A WOMAN TO PREACH."

EACH successive generation seems obliged to fight truth's battle anew; thus after centuries, stained with the record of wars waged against those who strove to walk in some new path, "for conscience' sake;" here in America, in the golden dawn of the second century of our national history; in this land born out of the claim that men had a right, "in freedom to worship God," a Presbyterian Presbytery solemnly devotes three hours to the discussion of the right of women to preach the gospel.

Since these brethren base their opposition upon one or two texts in the Bible, arguing from these that revelation forbids women preaching, we desire in all earnestness to submit a few texts, which many of our clergymen seem to have utterly ignored. In that same "eleventh" chapter of First Corinthians, the same "Paul," who is quoted so often as the author of the command. "Let your women keep silence in the churches," writes, in regard to woman "praying and prophesying:" "But every woman that prayeth or prophesieth, with her head uncovered, dishonoreth her head." Yet, again, and in the sacred name of truth and justice, we ask every Biblical scholar to study the meaning of these words, in all their length and breadth, hights, and depths: "Neither was the man created for the woman [woman being complete in her spiritual nature], but the woman for the man." "For this cause ought the woman to have power on her head, because of the angels."—I. Corinthians, eleventh chapter, tenth verse. We have consulted many Biblical scholars, and all have admitted that this verse referred to woman's spiritual nature, being the necessary complement to man's. It has never been part of our creed that women were so much better than men, but of late, judging by the suicidal policy of our churches, we are beginning to conclude that women have finer spiritual insight, and just here we wish to call attention to one fact. Some of our most thoughtful statesmen have based their only objection to woman-suffrage on the ground that women, through their religious zeal and fanaticism, would endanger freedom of conscience, and yet, in national convention assembled, the women of the nation voted almost unanimously "yea," upon a resolution for the taxation of church property.

The Orthodox church has been almost suicidal in its treatment of women. (And I write as one whose name still stands on the membership list of a Presbyterian Church; church beloved of me for its sacred memories, not for its creed.) The course has however been beneficial in its effects upon women. Persons who have not looked into the subject, aye, persons who have not walked, with wounded, lacerated hearts, through the terrible realities can form no idea of the suffering occasioned young women (whose consciences summoned them to speak for temperence and woman suffrage) by the persecutions encountered in the church. We have known clergymen come straight from the pulpit where they have talked eloquently of "moral courage," of the heroism of "Martin Luther," and "Calvin and Wesley," and even of "Garrison" and "Harriet Beecher Stowe," to meet with a sneer some brave young woman who, with the same moral courage, was proclaiming the truth as revealed unto her. We wondered, sometimes in agony of soul, why such things are permitted to-day. We recognize that out of such warfare merge heroes ready for the race. If our young women had been petted, courted, and feted, as most of our male theological students are; if the church had made haste to superintend their theological studies, they would have been, to-day, shut up in musty libraries, poring over the lifeless thought of a century ago, and would have emerged, catechism in hand, with only the husks of truth; but they have been ostracised from theological schools; they have been compelled to go out into the by-ways and hedges; they have commenced their heaven-ordained ministry, not in the lofty pulpits of debt-bound churches, but in the unattractive halls where the people congregate; they have studied human nature; they have commenced a gospel of temperance, of peace, of purity, which the great sorrowing world was starving to hear; they have been persecuted for righteousness' sake, and their work is blessed of truth, and that truth shall make them free.

You may summon the theological world to discuss the question, you may write over every pulpit in Christendom, "Sacred to men," and though with closed doors you solemnly place the seal of the church upon your decree that women shall not preach, ere the deep amens die away into echoes, there shall float in through the partially opened windows some woman's voice, falling in benediction upon the waiting crowd outside, "Let us pray for a blessing."

You may decide that women shall not preach in Presbyterian, Methodist, Baptist, or Congregational churches. (You have the power to thus decide. You have decided that two-thirds of all your membership shall be governed by the masculine one-third, and it is well—women do not care to be held responsible for the present condition of affairs in church or state.) But, despite your decisions, women will preach, and the world will listen. The world is listening, waiting, now. —*Inter-Ocean.*

WOMAN'S REBUKE TO WORKINGMEN.—If workmen refuse to recognize and be governed by the laws of nature, which bind men together as opposites the complements of each other, they must suffer the consequences. He is the workingman's true friend who says to each one, "Paddle your own canoe." All this twaddle about taking care of them, as if they were a flock of tame pigeons, is an insult. It is bad enough to be a woman, and have men make spheres like toy balloons, and put one in to stay, but it must be worse to be a man and have to be taken care of like a little plaster-of-paris Samuel saying his prayers. A human biped with a beard must feel nice to have political economists discuss him as if he were one of a thousand bags of wheat which were to be disposed of to the best advantage. 'Pears to me, if I were a man, with all the waste cabins and idle fields in this country before me, I should save agitation committees and ex-secretaries the trouble of talking about me; for, if I did not raise my own pork and beans, it would be curious.—*Mrs Swisshelm.*

A TRUE woman is one who acts in harmony with the laws of her being, the laws of God and the universe, all the vast and varied germ of her spiritual nature as the offspring of God, a citizen of the universe, a candidate for eternity. Her potentialities are unmeasured and immeasurable. Neither wifehood nor motherhood affords a millionth part of the space or time which are required for their full play. Womanhood is a tree organized to strike the roots of her sympathies deep and wide into the realms of spiritual being, and send forth ever-multiplying branches of beneficent influence, shooting out in all directions and heavenward, from age to age. A true woman will always be a noble wife and a noble mother, but immeasurably more.—*Free Methodist.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE

MOP-HANDLE PAPERS—NO. 3.

"How nice you keep your floor;" said a friend to Mrs. King, "You must find it a great task with your large family."

There was not a yard of carpeting in the whole house; therefore each floor in the building must be scrubbed at least once a week, for Mrs. King was no slattern. Her housekeeping was her pride.

"Indeed, you may think it a task, but my floors stay clean for a while. I could never see the sense of nearly killing one's-self for the sake of a clean floor, and the very next minute have it completely covered with the tracks of muddy boots, as some folks do. But my folks know better than to track my clean floor, as I very soon give a walking paper to one who enters my door without properly cleaning his boots. Why no longer ago than yesterday I brought *forty* pails of water—its a fact—from the well out by the road—a distance of five or six rods—to clean my floors, and I had to climb over that rail fence with every one. My floor gets a pailful of clean water for every square yard, and I wash every bit of it with a cloth, getting down upon my knees to do it. That's the way I work, and when I get through I am so tired that I am just fit for the bed. But you could not find a teaspoonful of dirt in my house if you were to try. And when I put on a clean gown and fresh collar, and get seated in my easy rocker, I am as happy as a queen, or at least I should be if my whole body did not quiver so with actual weariness. But I never let my husband or children step a foot into the house until my floor is dry. They must take themselves off to the store or barn, whichever they please, but they cannot come near my work."

And I knew all this was too true. She would not have her floors covered with carpets—they were always full of dust. She knew no other sphere of usefulness than keeping her house in order according to the old Puritan style, and attending to the bodily wants of her family, consisting of herself, her husband, three children, and a dozen boarders. She seldom kept a girl, because one "wasted more than her wages amounted to, to say nothing of her board." She had broken down a once strong constitution by hard work, and so much of this work was unnecessarily hard, that I felt sympathy was wasted on such a nature.

Not many months later she was confined to her room with a lingering consumption, brought on, the physician said—and for once he was right—by overwork. And when her little daughters were needing a kind mother's care and counsel, they closed her eyes, folded her hands across her motionless breast, and then followed all that remained of their mother to the Silent City.

She had just as surely taken her life by her own hand as though she had taken poison or thrown herself in the swift-flowing river. And how many thousands of her sister women are following in the same track!

Voluntary slaves! they exile themselves from cultivated society, eschew books entirely, frown upon all works of art, and make their families desolate and homeless, while they preside over the hearthstone. Almost invariably we find the *scrupulously* clean housewife an inveterate scold. And the husband and children of such a one are no more to be envied than are the wife and children of a common drunkard. My mother says when a floor is too clean for the family and friends to walk upon, it had better be hung up out of the way.

Dear RURAL sisters, don't worship your floors to the destroying of body and soul. Garnish the floor of your hearts and adorn the mind with a cheerful spirit that shall be so attractive that an occasional bit of dust in your cottage or palace, will not be noticed. Kind words and beaming eyes go much farther in making a pleasant abiding place, than frets and frowns, though your floors are as white as milk and the print of a child's foot on them is never seen.

MAY MAPLE.

A NEW DISH.

I RECEIVED last spring from the editors of the RURAL, a package of assorted fancy beet seeds. Their growth has been luxuriant, the leaves of many now measuring over two feet from base to apex, while the petioles are often three inches in width. These last, that is the petioles or stalks, are very crisp and tender, and when boiled and served with drawn butter, make a most palatable dish. Friends, upon eating it at our table, dressed in this way, have called it asparagus and remarked on its tenderness and freedom from strings. Upon being told what they were eating, a few have made the bold assertion that they "preferred it to asparagus." While I cannot say I *prefer* it to asparagus, I may say that I have found the petioles and midribs of these fancy beets, especially those of what is termed the white and silver-ribbed varities, a very good substitute for it. Although heretofore cultivated chiefly for ornament—at least in this country—I have little doubt that the ribs, if prepared according to the following recipe, would prove an economical, acceptable dish. We shall call it

MOCK ASPARAGUS.

Wash, cut into lengths of eight inches and tie into bunches; boil in salted water until tender, which will be in from twenty to thirty minutes. Have toasted some slices of bread nice and brown; dip into hot milk, butter and place the stalks on them. Pour over a sauce made of milk, butter, pepper and salt, thickened with a trifle of corn-starch. Serve at once. The sauce may be omitted and the stalks garnished with poached eggs, in which case vinegar or catsup would be a savory addition.

Another way to prepare it is to cut into inch lengths; boil until tender, drain, add milk, butter the size of an egg and pepper and salt to taste; roll three or four butter crackers and add just before it is served.

DOMESTIC RECIPES.

Chowder.

One peck of green tomatoes chopped fine; soak over night in a strong brine; then drain, and add one large head of cabbage chopped fine; cover with vinegar, and cook slowly one hour. Prepare one pound of sugar, one tablespoonful each of cinnamon, cloves, allspice and pepper, four tablespoonfuls of ground mustard, and a pint of grated horse-radish; mix all together with two quarts of vinegar; bring to the boiling point; drain the cabbage and tomato, and pour this mixture over. Pack tightly in a jar, and set in a cool place. Two red peppers and six onions may be added if liked.

MRS. M. P. ALDRICH.

Canned Grapes.

Squeeze the pulps from the skins, and heat until they separate from the seeds; strain through a colander; boil the skins a few minutes in a little water; then add the pulp and sugar—one-half pound of sugar to each pound of fruit after the seeds are removed—and boil one-half hour. If once tried, I do not believe any one will cut each grape in half and take out the seeds.

Canned Quince.

Pare, halve, remove the cores; boil in water until soft; then make a sirup, allowing three pounds of sugar to seven or eight of quinces; cook the quinces for a few minutes in the sirup; then put in jars and seal.

Tomato Chowder.

For two gallons of chowder, take one-half bushel of green tomatoes, one head of cabbage, six green peppers, two onions, one teacupful of grated horse-radish, one tablespoonful of ground mustard, two teaspoonfuls each of ground cloves and cinnamon, and three teacupfuls of sugar. Chop the tomatoes at night; sprinkle a teacupful of salt through, and let drain over night in a colander; then cook slightly in vinegar, drain again, and add the cabbage, pepper and onions—each chopped separately; mix all together with the sugar and spice; put into a jar; pour over fresh, cold vinegar. Let it stand a few days before using.

MRS. BORT.

Tomato Pickles.

Slice green tomatoes; place them in salt and water over night; in the morning, drain; scald them in vinegar; again drain, pack in jars, and pour fresh, hot vinegar over, to which has been added horse-radish and spice.

Ripe Tomatoes.

These may be kept part of the winter by putting them in one part vinegar to two of water, with a weight on top to keep them under.

Lima Beans and Sweet Corn.

For a change I cook these together, cutting the corn from the cob and cooking with the beans until tender and about dry. Season with butter, cream and pepper, salt being added when they are put on to boil.

MRS. C. MCCOY.

Recooking Boiled Fish.

Take two pounds of cold fish and cut into quite small pieces; scald a pint of sweet milk; mix in one-fourth pound of butter; a tablespoonful of corn-starch; pepper and salt to taste and the beaten yolks of three eggs; butter a dish, put in, first a layer of fish, then one of paste; thus alternate, leaving the paste on top; bake three-quarters of an hour in a moderate oven.

Cauliflower.

Put to soak in salted water for an hour or more; look over carefully, remove the hard stalk and leaves; scald for five minutes; cut into pieces and put into a pie dish; add a little milk, and season with pepper, salt and butter. Cover the whole with dry grated cheese and bake.

A Side Dish.

Boil some eggs until hard; remove the shells; cut in half; take out the yelks and beat up with a little chopped parsley seasoned with pepper and salt; refill the whites and serve with drawn butter.

Okra and Tomatoes.

Peel and slice six ripe tomatoes; take the same amount of *tender* sliced okra and one sliced green pepper; stew in porcelain for twenty or thirty minutes. Season with butter and salt and serve.

Summer Squash.

When young and tender, do not peel or take out the seeds, but boil in as little water as possible, from one-half to three-quarters of an hour; drain, mash and set on the back of the range to dry out for ten or fifteen minutes, stirring often; season with pepper, salt, butter or cream. If the squash be old, peel and remove the seeds before boiling.

Vegetable Curry

Take carrots, celery, parsley, potatoes, onions and cucumbers; cut small and add to some good stock properly seasoned. When sufficiently stewed, mix in a piece of butter with flour to give it thickness, a table-spoonful of curry powder and the juice of a small lemon. Boil up and when serving add a spoonful of catsup.

Ripe Tomato Pickle

Peel ripe, round tomatoes—do not scald—put into a jar; scald spice—tied in a bag—in good vinegar and pour while hot over the tomatoes.

Cauliflower Pickle.

Cut away the leaves and pull apart the flowers in bunches; soak in brine twenty-four hours: drain, put into bottles and pour hot, spiced vinegar over. Seal at once.

Mock Olives.

Gather plums just before ripening; make a pickle of vinegar, mustard-seed, cloves and a little salt and pour hot over the plums; let them remain over night; drain off the vinegar, reheat and pour over.

Apple Preserve.

Peel, halve and core six large apples, selecting those of the same size, have prepared a sirup made of one pound of granulated sugar, and a pint of water; when it boils, drop in the apples with the rind and juice of a lemon, and two or three cloves. As soon as they are tender, care must be taken that they do not fall in pieces, take the halves out one by one, and arrange, concave side uppermost, in a glass dish. Drop a bit of currant jelly into each piece; boil down the sirup, and when cool, pour around the apples. This makes a very nice preserve for tea.

Apple Rice Pudding.

Peel, halve and core six tart apples; place them in a flat stew-pan, with a little water, two tablespoonfuls of sugar, two or three cloves, and a stick of cinnamon; when tender, take up carefully; boil the sirup a while longer, and pour over the pieces. Boil two-thirds of a teacupful of rice in milk, with a scant teacupful of white sugar, and the rind of a lemon, until the rice is thoroughly cooked; then take out the rind and stir in the beaten yelks of three eggs. Put half of the rice at the bottom of a pudding dish; spread over the apples; cover with the remaining rice, and place in a cool oven for ten or fifteen minutes; beat the whites of the eggs into a stiff froth, add the juice of a lemon, three tablespoonfuls of powdered sugar, and spread over the pudding. Return to the oven until of a delicate brown.

E. M.

News of the Week.

POLITICAL.

MONDAY, August 19, 1878.

Newspapers in Texas are once more agitating the policy of making two or even three States out of that huge commonwealth. Such a division would give them more political power, tend to foster the diverse interests of different parts of the State; but would at the same time necessitate the expense of different governments, and be likely to check public works, which are best prosecuted in a thinly settled State by the united action of the great body of citizens. On the question of electing a U. S. Senator, the Legislature of North Carolina is said to be divided thus: Vance, 73 votes; the present Senator Merrimon, 39 votes; republicans 58 votes on the first ballot. As it takes 86 votes to elect, the republicans will hold the balance of power and probably re-elect Merrimon. Special attention is drawn to this State, by the fact that it is the only Southern State in which, under the new order of things, the republicans have any show.

Gen. J. B. Gordon, of Georgia, is sure of being returned to the U. S. Senate, 117 members of the legislature having already declared in his favor. The Mexican border troubles seem to be about to come to a belligerent conclusion. For some time back parties of Mexicans have been drilling across the Rio Grande with a view of resisting any future expeditions of the U. S. troops in pursuit of cattle thieves. The "greasers" have been boasting very loudly of the ease with which they could whip the contemptible Yankee nation, and now it is reported from Washington that an opportunity will be given the braggarts to come into collision with the "boys in blue;" for orders have been issued to Gen. Mackenzie to continue to pursue any bands of white men or Indians who may run Texan stock into Mexico. Mackenzie will probably have so strong a force that no one will venture to attack him; but the prospects of war are said to be more threatening than they have been for years.

During the past week the Potter Investigating Committee has been in session in this city, the two principal witnesses examined being Mr. Roberts of the N. O. Times, and a Mr. Leete, its Washington correspondent. The former's testimony was mainly in confirmation of the evidence already given as to Hayes' readiness, before he was declared President, to bargain with the South for their assistance; he insisted, however, that the whole transaction was perfectly honest and honorable; but owned to Butler that whatever tended to benefit his own side bore that character. Leete out-did red-headed Jim Anderson, in glibness and self-conceit. He was a clerk in the N. O. Custom-House, and several other things down there, was the confidant of everybody and knew everybody's business, probably better than himself. His role was that of the Irishman at Donnybrook Fair—whenever he saw a head to hit it. Accordingly every man he spoke about, visiting statesman, governor, senators, politicians, were all rascals, and he knew and could prove it. Even his old friend, Andersen, was a rogue and, worse still, a fool. He was very amusing at any rate, and therefore 'tis pitiful that yesterday evening he became crazy; thought that so many had reason to fear his revelations, that they were secretely following him about; he fired three or four shots at imaginary enemies through his room door at the Astor House and slept last night in the lock-up.

England has come to an agreement with Turkey as to the reforms the latter is to introduce into the government of Asia Minor. These are to be the work of the Turks themselves, John Bull acting merely as spectator so long as everything pleases him. But he is mighty apt either to take the whole matter in his own hands, should the Ottomans prove intractable, or else leave them to their fate and the Russians, retaining for his own share of the spoils Cyprus and whatever else he might be able to appropriate.

MISCELLANEOUS.

The government has started in the manufacturing business, Secretary Thompson having, at the cost of $9,000, set up a rolling-mill in the neighborhood of the Navy Yard at Washington. Instead of putting a pretty penny into the pockets of speculators by the sale of scrap iron at a nominal price, it is there manufactured into excellent sheets, well suited for naval purposes, at less than half the cost of a similar article in the market. It is now in order for manufacturers to grumble at unfair government competition! Insurance against storms, a German practice, is getting a foothold among the farmers of the west,—the St. Paul Hail Insurance Company having just paid out $19,000 in Carver Co., Minn., for damage to crops. The Indian war in the Northwest is virtually over, the hostiles having broken up into small parties, most of which are anxious to submit. Train robbing seems to be becoming more frequent and easy in the Far West. The other day four armed men captured a train near Atchison, Kansas, took $5,000 from the express safe, and escaped unhurt, the attack being made on the express car, and the passengers being entirely ignorant of the occurrence until it was all over.

Along the Connecticut River, and elsewhere, in New England, large quantities of fish are being found dead in the waters, and the blame is laid upon the liberal use of Paris-green to destroy the potato beetle. The poison, it is claimed by some, is washed into the rivers in such quantities as to be fatal to the finny tribes, while others say that the fatality is due to the fact that the fish eat the poisoned beetles washed from the vines into the streams. Large numbers of birds are also found dead in different parts of the country; it is supposed from the same cause. It is not unlikely that less Paris-green will be used next year. The revenue and judicial troubles in South Carolina have been arranged amicably. The "moonshiners" are surrendering in large numbers on promise of pardon for past offenses, made to all with the exception of the notorious Redmond and a few others, who have shot at the revenue officers. The United States officials, held by the State in defiance of the authority of U. S. Court, have been surrendered under protest to the U. S. Marshal. In making the surrender the Sheriff acted on instructions from Gov. Hampton.

At Ottawa, Canada, on the 12th, 600 Orange Young Britons celebrated, by a procession, the anniversary of the closing of the gates of Londonderry during the war between James II. and his son-in-law, William of Orange, in 1689. The Roman Catholics of the city, taking this exhibition as an insult to their religion and to the Hibernian nationality of most of them, mobbed detached members of the organization. The Orangemen retaliated, sacked several houses, used pistols and bludgeons freely, and threatened to burn down the Catholic Cathedral. A huge crowd of their opponents collected about the building for its defense; for one night and a couple of days, the city was hourly in danger of a bloody riot, but by the intervention of the military, and the exertion of the mayor, the visiting Young Britons were sent quietly off, from a distant railroad station, and quiet was finally restored.

The ravages of yellow fever in the South are becoming truly terrible. Yesterday there were in New Orleans 115 new cases and 47 deaths, and during the past week the daily average was only slightly less. Every year the type of the disease differs more or less from that of former visitations. Sometimes it is much less fatal than at other times; but this year the proportion of deaths to cases is greater than at any time since 1853 in the Crescent City; and the disease has been unprecedently fatal in Grenada, Miss., where nearly every one attacked has perished. This town is depopulated by by its ravages; all who could do so have fled; and few remain except the sick, the nurses and the doctors. In Vicksburg there were, on last Saturday night, 48 cases, and it is estimated that about twenty new cases occurred yesterday. Memphis has been also terribly visited but there it is just now abating, only thirteen deaths having taken place yesterday, and

merely nine new cases. Despite the rigid quarantine, one case has just occurred in Mobile. Louisville, Cincinnati, St. Louis, Washington and all large cities in direct communication with the afflicted region, are establishing strict quarantine regulations, while the smaller towns are still more anxious to keep the plague at a distance. It is yet early in the season for the malady to have become so disastrous, and it is to be feared that its ravages will, later on, become still more widespread and fatal. Pecuniary help is earnestly solicited for the stricken towns, and in no more charitable way could money be expended.

FOREIGN.

On Tuesday last there was a grand review of the British fleet at Spithead, the Queen and a host of distinguished visitors were present, but the weather was wet and stormy, so that as a show it was hardly a sucess. It has just been officially announced in the House of Commons that the number of deaths from starvation during the late famine in British India, amounted to 1,350,000. The session of the British Parliament was prorogued by the Queen on Friday, until November, 2nd. In her speech from the throne, she congratulated the nation on the successful results of late negotiations; on the acquisition of Cyprus, and the loyalty of India and the Indian troops; and also on the assurances of an enduring peace, afforded by the late treaty of Berlin. The radicals of a part of London called Southwark propose to nominate Miss Helen Taylor, a neice of the late J. Stuart Mills, for Parliament, at the next general election; so as practically to raise the question of women's right to a seat in that body. London advices from the west coast of Africa say that great mortality has lately prevailed there, especially at Lagos, where nearly a quarter of the European population died of fever and dysentery within the two months ending July 4. Disraeli is conciliating Ireland by releasing the imprisoned Fenians. One of the few still in confinement, was set at liberty last week and another this week.

Hoedel, the would-be assasin of the German Emperor, was decapitated at Berlin on last Friday. The Emperor is said to have wished to spare his life, but to inspire terror it was deemed best to inflict capital punishment. Since June 2, the date of Nobeling's attempt, 563 persons have been arrested in different parts of Germany for speaking insultingly of the Emperor, and of these, 521 have been convicted, including 31 women. Five of the accused committed suicide before trial, and the aggregate of the imprisonment imposed amounts to 811 years. The recent elections in Alsace and Lorraine, it is said in Berlin, show an increase of the moderate party and a decline of the irreconcilables. A conference of French and American political economists now in session proposes a new commercial treaty between the two countries, by which the French prohibition laws with regard to some articles should be abolished, and their high duties on others reduced from 30 to 40 per cent. this country reciprocating. The greatest reductions would be on wines and silks, on which it is proposed to have a sliding scale of tariff for three years.

The phylloxera has paid a visit to Spain, where, in the neighborhood of Malaga, its ravages in the vineyards are increasing alarmingly. At St. Petersburg Gen. Mesentzow, chief of the Emperor's private police, was stabbed to death in the street last Friday. His two assassins, after firing at those who tried to arrest them, jumped into a drosky and escaped. It is said that the murder was a sign that the Russian socialist party sympathized with Hoedel, executed at Berlin on the same day.

The Russians begin to-day to embark on their way home from the vicinity of Constantinople, and at the same time some of the British fleet will withdraw, so that the disappearance of both from that neighborhood will be simultaneous. In a fortnight Batoum will be surrendered to the Muscovites, just as Varna and the other fortresses of the quadrilateral have already passed into their hands.

The Bosnians are offering a stubborn resistance to the occupation of their country by the Austrians. Several severe engagements have already been fought at places more hoplessly unpronounceable than the battle scenes in Bulgaria, and one division of the invading army was forced to retreat, but having been heavily reinforced, has again advanced. Large numbers of Turkish regular troops having been disbanded, have joined the insurgents; and there is little doubt but that the Porte is actually encouraging the movement. On this presumption, Bismarck has sent a curt message to Constantinople that unless Turkey rigidly obeys the terms of the Berlin treaty her position in Europe will be endangered. The Porte is naturally indignant at such a peremptory warning and is disposed to protest.

VARIOUS.

Mr. Moody, the evangelist, keeps a large number of strong brown-paper envelopes, labelled with different religious themes, and whenever he sees anything in the newspapers that bears upon one of the subjects, he cuts it out and puts it into the proper envelope. When he gets ready to think out his sermon, he refers to these clippings.

The late Mr. Reese, the California millionaire, was never known to keep a horse or carriage unless he got it accidentally in trade. He would wait ten minutes at a street corner before getting into a car in the hope of meeting an acquaintance who would pay his fare. When taunted by a friend one day in regard to his miserly habits, he said: "Well, I can't help it; I know it's foolish, but it's a disease I've got." In all matters not connected with money he was a man of great intelligence and liberality. It is said he has bequeathed a large part of his wealth to charitable purposes.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Aug. 17, 1878.

BEANS AND PEAS.—Medium beans have sold somewhat more freely, but it is more on account of concessions in price than from an improved or wholesome demand; 152½ is now accepted for best grades free to vessels. Medium beans are quiet, prime ranging with marrows. Pea and white kidney have no demand. Red kidneys are higher for extras. There is a strong inclination on the part of sellers in beans to reduce stocks as much as possible before the appearance of new. Red kidney is the only sort that does not show a late surplus. Green peas dull at $1.20@1.25; a car-load of reputed new held at $1.50; no quotations for Southern S. E. peas until new crop arrives. Canadian peas extremely quiet, at 76½@77c. $1 35@1 50; red do., black $3 25@3 35; $2 35@2 40. Lima, old not wanted, as green are in season.

We quote medium beans, prime, $1 50@1 52½; fair to good, $1 35@1 45; marrows, prime, free on board ship, fair to good, $1 40@1 45; Pea, $1 35@1 50; white kidney, Exports of beans past week, 1,304 bbls.; receipts, 4,524 bush.

BUTTER.—Since Tuesday, the market had weakened a trifle on fine grades; the recent firmness has sent in a larger supply of choice State, and, as the outlook is for further free receipts, dealers seem disposed to humor the local trade, which is now their main outlet. The market feels very sensibly the light export demand, Western particularly, especially as State has again obtained the run of retailers. When prices stiffened a short time ago, city retailers felt safe in marking up prices, but as buyers these days want quality to match high rates, grocers and others are forced to draw from State, which arrives regularly, instead of trusting to the promise of sellers, to the effect that "some fine, cheap Western is on the way." Western creamery has worked into a rather stronger position than before, but we notice that sellers do not let a customer go away when 22c. is objected to. The very common trade of the city is drawing upon well-kept cold stores; many new invoices of Western are running, and will be likely to drop from the asking prices; in fact, some marks of ladle packed are superior to some dairy lots. Firkins are dull and likely to be while the fever rages at the South. It is the feeling of the trade to work down stock as freely as possible, as a prosperous fall yield will make bad averages if sellers are caught with a surplus of that which will not pass soundly through the trying weather of August.

State creamery, choice, 22@23c.; other, 19@21c.; half tubs and pails, choice, 19@20c.; other, 13@17c.; Welsh tubs, best, 17@18c.; other, 12@14c.; poor State, 9@11c.; State firkins, 17@20c.; Western creamery, choice, 21@22c.; other, 18@20c.; Western dairy, best, 13@14c.; other, 9@12c.; factory (ladle packed), 9@10c.; other, 6½@8c.; milled Western, 5@7c.; old and grease, 3@5c.

Receipts for the week 30,025 pkgs.; do. last week, 32,681. Exports, 5,171 pkgs.

BROOM CORN.—Nothing doing beyond the small lots needed by manufacturers. Quotations are: 6@6½c. for hurl and short brush; 5@6c. for medium green, and 4@4½c. for red and red tipped per lb.

COTTON has shown frequent wide fluctuations, but closed up strong. Latest quotations are for August, 11.33c.; for September, 11.60@11.61c.; for October, 11.37@11.39c.; for November, 11.20@11.21c.; for December, 11.15@11.16c.; for January, 11.16@11.17c.; for February, 11.22@11.24c.; for March, 11.30@11.31c.; for April, 11.37@11.38c.; for May, 11.44@11.46c.; June, 11.51@11.54.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*Ala.*	*Orleans.*	*Texas.*

Stained.

Good ordinary..10 3-16; Strict good ordinary...10 11-16
Low middling..11 3-16; Middling.....11 9-16

CHEESE.—Receipts have increased, but the better grades have been taken up pretty well, the receipts reaching 101,000 boxes. The slightly stronger feeling which developed with the close of last of last week, made headway after the country sales, and a sharp competition for the choicest colored lots; from S the market jumped up to 8¼, and then to 8⅜ for selections of colored, and fancy stock may be quoted at 8¼@8¾.

Quotations are: Fancy at 8¼@8¾c.; 6¼@7¾c. for good and prime; 6@6¼c. for fair; 4@5c. for half skimmed; 2@3¾c. for skimmed. State, farm dairy at 6@6¾c. for good to choice, 5@6c. for fair to good, and 2@3c. for poor skimmed. Wisconsin factory, fine to fancy, 7¾@8c.; do. good to prime, 6@7c.; do. fair, to good, 5¾@6c.; Western factory, fine, full cream, cheddar, 7¼@7¾c.; do. fine, full cream, flat, 7@7¼c; do. slightly skimmed, flat, 5¾@6¼c.; do. half skimmed, 4@5c.; do. full skimmed, 2@3c.

Receipts for week, 122,763 boxes; do. last week, 92,306 do.

Exports, past week, 101,010 boxes.
Liverpool cable quotation, 48s.
Gold closes at 100⅜.

DRIED FRUITS.—Small lots of new apples have been placed at 3@3½; the quality only fair. Blackberries are plenty and easy. Cherries hold firm. Peeled peaches show but little prime stock.

New blackberries, are quoted at 6@6¾c. Peaches—Georgia peeled, 4@7c.; do. new, 4@8¾c. for poor to prime; unpeeled old halves, 3¾@4c.; quarters, 3@3½c. Pitted cherries, 14¾c.; southern plums, new at 9@10c. Apples—State quarters, 3@4c.; do. sliced, prime, 4¾c.; good, 3¾@4c.; western quarters, 2@3c.; southern at 4@4¼c. for prime sliced; 3@3¼c. for fair to good; southern quarters, 2@3c.; Tennessee quarters, in bags, at 1¾@2c. New apples at 3@3¾c. for southern quarters in bbls. New raspberries, 22@22½c., and evaporated, 24@25c.

Exports past week, 218 bbls. apples, Since Jan. 1st, 10,753 do. Same time last year, 23,425 do.

EGGS.—Receipts for the week, 4,747 bbls.; do. last week, 4,618 do. The market has ruled irregular, without however violent fluctuations. Old stock is well out of the way, and as the outside cold is better, receipts of fresh are not weighty, and dealers now look for fair steady prices.

Near-points, 16@17c.; State and Penn., 15@15½c.; fresh Western, 14¾@15c.; do., Canadian, 15c.; poor to fair western, 13½@14c.

FRESH FRUITS.—The tradition of a heavy yield of apples after "locust year," is thoroughly fulfilled this season. Arrivals are far beyond the wants of trade or the means of distribution. Prices are low, and with expensive peaches this year they ought to sell better than they do. Orange pippins, per bbl., 75c.@$1 25; Nyack do., $1@1 50; Golden Sweet and Sour Boughs $1@1 50; fancy, including "King William," a new sort, $2@2 50. Pears are in fair demand. Southern run poor. So. Bartletts, crate, $1@1 50; Sickle, $2@2 50; choice Northern Bartletts, bbl., $6@7; other, $3@4 50; bloodgood's, Clapp's favorite, and other table pears, $3@5; cooking, $2 50@3 50. Plums, egg and green gages, bbl., $6 50@7; blue, $4@6. Grapes, Southern, Delaware, 11@13c. lb.; Ives, Concord and Hartford, 5@7c. Whortleberries, $1 50@2 50 bush., soft to hard. Peaches have arrived just fast enough to make steady prices. Extra crates Del., $2@2 50; good, $1 50@1 75; plain baskets, $1@1 25. Melons are in large supply. Extra $2@2 25. Watermelons, selected, $15@25 per 100; culls, $5@7; Keyport nutmegs, bbl., $2@3; South Jersey, $1 50@2. Peanuts dull at $1 40@1 50 bush., hand picked; other $1 25@1 35. California pears, $5@6 box; do. plums, $3@4. Hothouse grapes, black Hamburg and muscat, 70@90c. lb. Sweet water 40@50c.

FLOUR.—The course of the market has been to a higher basis, on the advance in wheat and liberal transactions.

Latest prices are $3.45@4.00 for very inferior to fancy superfine State; $4.00@4.20 for poor to good extra do. odd lots and lines; $4.20@4.50 for good to very choice do.; $3.35@4.00 for very poor to fancy superfine Indiana, Iowa, Michigan, Ohio, &c., $4.00@4.20 for inferior to good shipping extra do. and $4.20@4.50 for good to very fancy extra do.; common to about choice white wheat extras, $4.30@5.40; choice to very fancy do. at $5.50@6.50; red and amber winter wheat, inferior to very choice trade and family at $4.15@5.75; round hoop Ohio at $4.00@$4.30, and trade and family brands of do. at $4.35@$5.75, the latter rate for choice, (very choice to fancy lots quoted higher); St. Louis, $4.25@5.00 for very poor to good extra, and $5.00@6.25 for good to very fancy; Minnesota clear, very inferior to very choice at $4.20@5.90 (fancy brands at higher prices); Minnesota "straight," very inferior to very fancy, at $5.25@7.25, and patent poor to strictly fancy at $5.50@8.75; unsound stock at from $2.60@5.25; city mill extra at $5 15@5.35 for West Indies (the latter rate for fancy in new packages); do. for England, 4.00@4.15; do. trade and family extras, $5.65@6.75; do. for South America, $5.45@6.00 for fair to fancy; No. 2 $2.50@3.25 for inferior to very fancy.

CORN MEAL.—Sales are at $2.40@2.70 for yellow Western, and $2.95@3.00 for Brandywine.

GRAIN.—Wheat has sharply advanced; export demands have been liberal. Corn is also better, and oats have a fair sale but at easier prices.

Latest sales of wheat are of—No. 3 red at $1 05@1 06; ungraded red at $1 02@1 12½; No. 2 red at $1 10¼@1 11¼; No. 1 red at $1 12½@1 13½; No. 1 red, steamer quality, at $1 11¼@1 12; ungraded amber at $1 08@1 13¼; No. 2 amber at $1 11@1 12; No. 2 amber, steamer quality, at $1 08½@1 10¼; new white State at $1 21@1 22; No. 1 white at $1 21@1 22; do., steamer quality, in lots, at $1 18@1 18½; No. 2 white at $1 16; No. 3 white at $1 12; ungraded white in lots at $1 08@1 22; No. 1 white, early September delivery, $1 20@1 21; No. 2 amber, delivery in last ten days in August, quoted at about $1 12; New York No. 2 red, August option, at $1 10¾@1 11½; do., September option, at $1 11@1 12; do., October option, at $1 11¾@1 12¾; New York No. 2 spring, September option, at $1 08. Rye at 63@65c. for western and 62@66c. for State. Corn at for—New York No. 2, August option, at 49¾c.; do., September option, at 50¼c.; do., October, at 52c.; steamer mixed, August option, at 48¾@48¾c.; do., September option, at 49¾c.; do., October option, at 51c. Spot lots were of steamer mixed at 48@49c.; ungraded mixed at 45@49¾c.; New York No. 2 at 49¾@50c.; New York No. 3, 47¾c.; yellow western at 50@50¾c. and No. 2 white at 56¾c. Oats—No. 2 Chicago at 33c.; New York No. 2 white at 32½@33c.; New York No. 1 white at 35¾c.; do., August option, at 37c., New York No. 1 at 33@33¾c.; New York No. 2 at 32c.; white western at 32½@37½c.; mixed Western at 30¾@33½c.; white State at 32½@36c.; mixed State at 31@33½c.; New York No. 3 white quoted at 30¾c.; New York extra at 33¼@34c.; New York rejected at 30c.; New York No. 3 quoted at 30@30½c.

HAY AND STRAW.—The receipts are liberal of new hay, but the best of it is having a very fair sale, and prices steady. Sales of hay at 45@50c., for shipping, and 60@80c. for retail qualities. Straw quoted at 35@40c. for long rye; 30@45c.; for short rye, and 30@40c. for oat.

Exports past week 184 bales. Since Jan. 1st, 41,603 do.; same time last year, 30,950 do.

HONEY.—There are reports of collections of comb ready to ship. It should not be sent here at the earliest before the fall is well set.

HOPS.—There is no change in the situation, export demand is at a pause, and brewers buy sparingly. The lull is incident to the approach of the new crop, the first bale of which was received here this week, and brought a fancy price as usual, in the competition to secure it at 25c.

Quotations are for New Yorks, good to prime, 10@12c.; do., low to fair, 7@9c.; Eastern, 7@10c.; Wisconsin, 7@10c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.; Pacific Coast hops, 10@12c.

LEATHER.—Latest prices are 19½@20c. for light hemlock; 19½@21c. for middle do.; 20@21c. for heavy do., and 17½@19c. for good damaged.

OIL-CAKE—Is scarce and wanted at about $30 per ton for western.

PROVISIONS have been advancing but closed weak with a decided decline. Mess pork on the spot quoted $10 70@10.90. $10 45 for August and September; $10 55 for October. Bacon at 6¾c. for western long clear. Lard—at $7 65 for new, $7 52½ for August and September; $7 60 for October. Steamine at 8¾ for western. Tallow at 6 15-16 for prime. Beef hams at $21 50. Beef—for extra mess, $11 25@11 50; plain mess, $10@11; packet, $11 25@12 for bbls. and $16 for tcs.; extra India mess, $19@20 for city brands; do. Philadelphia, $18@$19.

POULTRY AND GAME.—Live fowls and chickens have improved under some Havana export and a steady city and near-by watering place trade. Prime Turkeys are scarce, a few hens would bring the extreme. Ducks are dull. N. J. chickens, 14@15c.; N. Y. & Pa., 13@14c.; Western, 12@13c.; Southern 12@12½c. Fowls—N. J. 13@14c.; State and Penn., 12@13c.; S. & W., 11½@12c.; Roosters, 5@6c. Turkeys, choice small, 14@15c.; other 11@13c. Ducks—Choice and spring, 50@75c.; other 40@45c. Geese—N. J., $1.25@1 50; S. & W. $1.12@1.25.

Dressed Poultry with moderate supplies bring fair prices. Turkeys, dry picked, 15@18c; fair to good, 13@14c.; Pa. Spring Chickens, 17@19c.; State and N. J., 14@16c.; Western, 13@14c. Phila. fowls, 14@15c.; N. J., 12@14c.; State and Western, 12@13c.

Of game the arrivals are larger and more varied. State Woodcock pair 70@75c. Western, 50@60c.; Grass plover, $2@2.25 doz; Stall-fed pigeons as before. Yellow legged sn p, large, $1 50@$1.75; do. small, 75c.; Dowitch, $1.25, Sand or ox-eyed, 15@20c.

TOBACCO.—Exporters have taken fair quantities, and the market is strong.

VEGETABLES.—New Jersey potatoes are not of good quality of late, and L. I. outsell them. Prices for prime are firm as there is in addition to a steady local demand and considerable shipment to Cuba. Exports for the week 5,700 bbls. Egg plants and tomatoes have declined. Market generally well stocked in other items.

Potatoes $1 37@1 62 bbl. early rose; culls 50@75c.; sweet potatoes, Maryland and Virginia, $3 75@4; Virginia red $2 50@2 75; green corn 75@77c. per 100; Lima beans, bag, $1 25@1 75; string beans, 62@75c.; cucumbers, 1,000, $2@2 50; tomatoes, three peck crate, 15@20c.; onions, Chester red, $1@1 25 bbl.; yellow, $1@1 25; marrow squash, $1 75@2; crook neck, $1 25@1 50; white, $1@1 25; peppers, bullnose, bbl. $1@1 50; red turnips, $1 50@1 75; cabbage, 100 flat Dutch, $4@5; red, $5@6; egg plants, $3@4 per 100; carrots, 100 buches, $1; beets, $1@1 25; lettuce, N. J., bbl., 50@75c.

WOOL.—Manufacturers buy very cautiously, not exceeding actual needs. The market is sustained, however, and all grades placed have been at full prices.

Ohio, Pennsylvania and West Virginia—XXX and picklock, 40@43c.; XX, 37@39; X, 36@38; No. 1, 37@39c.; No. 2, 34@36c; common, 30@32c.; combing, 40@45c.

New York, Michigan, and Wisconsin, XX, 34@36c.; X, 33@35c.; No. 1, 34@36c.; No. 2, 32@34c.; common, 27@30c.; combing, 38@43c.

Indiana, Kentucky and Tennessee—XX, 34@36c; X, 33@35c.; No. 1, 34@36c.; No. 2, 32@34c.; coarse, 27@30c.; combing, 33@42c.; unwashed combing, 28@33c.

Illinois, Iowa and Minnesota—XX, 34@35c.; X, 32@34c.; No. 1, 33@35c.; No. 2, 29@31c.; coarse, 25@27c.

Georgia, Alabama, Mississippi and Louisiana—Fine unwashed, 27@30c.; medium unwashed, 26@29c.; coarse unwashed, 18@21c.; burry, 11@13c.

LIVE STOCK MARKETS

Saturday, Aug. 17, 1878.

BEEVES.—Receipts for the week, 10,023 head; do., last week, 11,115 do. The market has a very unsatisfactory phase; wholesale prices are damaging shippers, while slaughterers' and butchers' sales have to be made on a low basis. Only a few choice Kentucky steers brought the extreme this week; all grades under dragged through weak and depressed. Ordinary to decent Texas sold at 6@6¾c.; Cherokee, 7c.; poor to prime native steers, 7½@9¼c.; extra and fancy, 9¾@10¼c.

COWS AND CALVES.—No change to note.

VEAL CALVES.—Receipts for the week, 4,000 head; do., last week, 3,625 do. During the latter part of the week prices have declined; 6¾c. is the top for best N. J., while 5@6c. buys good milk market stock. Buttermilk and grassers, 3@3¾c.

SWINE.—Receipts for the week, 23,780 head; do. last week, 20,637. Trade is dull; the weather is bad for dressed stock, and buyers limit their purchases. Sheep, 3¾c.@4¾c.; lambs, 4¼@6c., with a few picked ones at 6¼.

BABY'S TALK.

WHAT do you fink of such little star-paddles,
Wiv five little points on 'em all 'e way roun'!
Some day they'll dit to be bid lite my daddy's,
An' dit all 'e white off, an' dit awfle brown.

Does you see those two fums stut on each corner!
They taste awfle nice—dust sut 'em 'an see!
My name is old Sweet-heart an' little Jat Horner
An' little Tom Tutter, an' pretty babee.

Ma wants me a dirl, an' puts on 'ese dresses,
An' divs me a dolly, an' tells me her joy;
Pa doesn't half lite it, an' says he confesses
He's velly diad of it I turned out a boy.

I've dot a boy's hat on, my dear papa made me,
An' doin' to have boots on to-morrow, perhaps;
I'll dit a bid man, wiv my papa to aid me,
Too bid to have playfins an' sit on fotes' laps.

I's dittin' so hung'y I tant sut my finner;
My mamma is tummin' to feed me, I dess;
Tum tate me up, mamma, an' div me some dinner,
I'll al'ys be baby,—I dess' 'at 's 'e bes'.

[*Golden Hours.*

"POCKET-MONEY FOR THE YOUNG PEOPLE."—No. 14.

AUNT FLORA.

As there are so many ways to secu re pocket-money, when children are taught to help themselves, in honorable as well as honest ways, may I suggest to others what I have already seen done by little children when the country was new and cash not very plenty for young or those older grown. Johnnie was a bright little boy, and one who interested his neighbors for his welfare, because he was disposed to do something else than leaning on his mother as so many children do, and Capt. Blank had a garden to be kept clear of weeds, so he proposed to Jonnie that he should help him to keep his garden clear by coming each morning and pulling weeds, and on Saturdays when there was no school, work an hour or so at a time, as many times as he was willing to do, through the day. His friend kept an account of the time, and paid Johnnie by the hour, with the understanding that he was not to waste time, but stop entirely when he was weary or wanted to play, and not attempt both work and play together. In this way the little fellow earned enough to get him a new coat, and make a present of a pair of gloves to his sister and have enough left for spending-money on the Fourth of July.

Succeeding so well in work made Johnnie anxious to earn something more, so he turned his attention to picking hazelnuts, and in the season for doing it, or before cold weather came, he had picked and sold three bushels of nuts to the grocer, for over two dollars per bushel. This made Johnnie very happy, as he could get for his mother some luxuries which she could not have had without his aid. In this, Johnnie's mother showed wisdom. She allowed him to help her and showed her gratitude for his willingness to do so, but never told him to keep it all to buy candies and toys with, as she knew it would make him selfish to do it when she was needy herself. Johnnie is to-day a noble and useful man.

LETTERS FROM BOYS AND GIRLS.

Our Swiss Cousin.

UNCLE TRUE AND COUSINS.—This will be probably the last letter that I shall address you from the Western Hemisphere, having now the firm intention to return to my native country during the latter part of September; this will give me a favorable chance to visit, at the same time, the Exposition in Paris where I have a number of old friends and schoolmates. I intend to stay there only two weeks, after which I shall proceed directly to my old mountain-home where I hope to meet my parents and friends once more. Though it is not without deep regret and sorrow that I take leave of the United States, whose political, rural and religious institutions I have enjoyed for almost four years, and whose inhabitants will leave a lasting impression upon me in regard to their hospitality, friendship and ingenuity; and though it seems to me very hard already to depart from the new friends I have acquired, during this sojourn; still I hope that they will write to me very often, as I shall do to them, and from my dear RURAL relatives especially I expect a constant correspondence through the RURAL. I would be pleased to give them from time to time some news concerning my career and welfare in Switzerland. Should it happen that UNCLE TRUE or any of my cousins ever come to Switzerland, I would be very much pleased to receive a call at my future residence in Neuhausen, near Schaffhausen; and I would be glad, if I could be of any help to them in any way.

You can see some of the finest curiosities and antiquities in my native city. I will mention by the way that our own residence was constructed Anno Domini 1567, and resembles a fort more than a peaceable farmer's dwelling. Only a few minutes' drive from our farm you could see the most picturesque scenery of Europe; namely, the Falls of the Rhine, where an immense mass of water comes down 120 feet over numberless rocks, so that the noise produced by this waterfall can be heard sometimes at a distance of 12 miles. At the foot of the Falls, about in the center of the river, nature has built, (probably for the accommodation of travelers) a solid rock that reaches about 30 feet above the water surface, and from whence you can obtain a splendid view of the Falls. The water tumbles down on both sides of the rock in the form of snow-white foam, and roaring so that the universe seems to tremble; and the air is filled with particles of water, that ascend to the zenith, where they are formed into clouds, and I am quite sure, that if "Dewdrop" our Ohio cousin, would stand a half hour only on the top of this rock, she would be transformed from a sweet looking dew-drop into a very wet-looking rain-drop!

But just now I remember, that this is not at all the subject I intended to write about. In my last letter, I described the duties of the peasant woman, and to-day I intend to write something concerning our manner of farming; but as this letter is almost too long already, I shall make it very short. In a former letter I told you that the farms in our country are generally small in extent, and consequently they have to be worked in a different way from yours, in order to secure to the farmers the interest on their money invested in the land.

Mowing, raking, sowing, etc., are done by hand. The area of land is so small and hilly, and labor is so cheap, that it would not pay small farmers to buy machines, even if they could afford to do it. The use of horses on farms is considered a luxury; their special work is all done by oxen and cows, that are harnessed instead of yoked up, as it is here the custom. I think that about two-thirds of the farmers in our state own neither horses nor oxen. They do all their work, teaming and plowing, with cows, which latter are usually hard to manage. They are mostly fickle, and run away at every convenient chance; and it is just as if nature told them that they were created for another purpose. Cattle are shut up in the stable the whole year round, when not in use, where they are fed and cleaned like horses, three times a day. Their food consists in winter of cut hay and straw, mixed with beets, turnips or malt. In summer, they are fed mostly on green clover and lucerne. Our chief products are wheat, barley, rye, oats, potatoes, wine, butter and cheese. Butter is made there without adding any salt to it, and tastes to us Europeans better than your finest creameries, with salt added. Cheese is made mostly in the Alpine regions, and a great amount of it is yearly exported to all parts of the world; and perhaps some of the Cousins have already tasted "Switzer Cheese" in America. Wine is made in the States of Schaffhausen and Geneva. The land cultivated for this purpose embraces six and a half per cent. of the total area of each state.

I will close this letter, and hope that Uncle True will have patience enough to correct the mistakes in it, and if it should be of any interest to you I will write you again after my arrival in Paris, telling you about my trip across the ocean and something about the Exhibition.

Expressing once more the ardent desire that some of you would honor me with a visit at home, I bid you all a hearty farewell.

JOHN SCHRYN.

Another Question.

DEAR UNCLE TRUE:—I am a new Cousin, claiming an introduction. I like to read the letters from the Cousins. I think the girls have worried Slayerofconceit long enough, and the boys ought to take his part. As some of the Cousins have been asking questions, I will ask one. Where is the Island of Cyprus, and to what country does it belong? ROB ROY.

[Cyprus is the most eastern of the Mediterranean group of islands. At its most easterly point it approaches within 65 miles of the coast of Syria, and on the north it approaches to within 44 miles of the coast of Asia Minor. It was a possession of Turkey, but by recent treaty has been ceded to England. It is an extremely fertile land, producing wine, cotton, silk, tobacco, and various medicinal products. The island has been a famous one in history. It early belonged to the Phœnicians, but was subsequently colonized by the Greeks, then passed under the rule of the Pharaohs, Persians, Ptolemies and Romans in succession, excepting a short period of independence. It was one of the chief seats of the worship of Venus, hence called Cypria. Salamis was one of its most famous ancient seaports. At the time of the Crusades it was made a separate kingdom for Guy of Lusignan. It then fell to the Venetians, the senate of the republic compelling the queen, Catarina Cornaro, to abdicate. Many of you may have remembered seeing, at the Centennial, the remarkable picture in the Austrian Exhibit, of this queen holding her court, but the time chosen by the painter was after her deposition, and when she was living in Italy, a queen without a material kingdom. U. T.]

Another Inquiry.

DEAR UNCLE AND COUSINS:—I am here again, and what think you brought me? Why I came purposely to see whether you were all dead, too busy, or too indolent to gather around Uncle True for our weekly chat. Come, come wake up, or I'll raise such a rumpus that you will have to. Instead of staying here in the close, warm study, let us hie to the shady lawn, or the cool summer-house, and chat as merrily as of old. Now I'm going to threaten you all, and it is a fearful threat as you may find later. Methinks I hear Sir Wildfire say, "What, *you* dare threaten *us*?" Yes, sir, I, your little Coz; four feet eleven inches tall, dare to threaten you "lords of creation," standing six feet high (more or less), and I will too, so here goes!

If you don't rouse up and make our own dear corner lively, by your pleasant chatter, I'll come every single week, and rattle like a magpie, and play more pranks than a monkey upon you.

There now! if that don't scare you, then nothing ever will, for I am an inveterate talker as you can plainly see. I often think it a good thing I was not at the Tower of Babel during the confusion of tongues, for if I had added my ceaseless chatter to the general jargon, mankind from that generation to this, would have been a race of lunatics. So beware how you tempt me to do desperate things. Well, as I have said all I wished, I will "fold my tent like the Arabs and silently steal away." Yours in tears,

MADCAP MOLLIE.

Too Diffident.

DEAR RURAL COUSINS:—I had the same trouble that Unknown had about introducing myself, till at last I decided to *come*. However I started, and said what I wanted to, but now I am here, I find there is no one so very formidable besides Uncle True, for most of the Cousins seem to have disappeared. Now, I want to hear from you again. Slayerofconceit, I think after that last letter of yours you deserve to be forgiven, but we don't want to forget you, too, so do join the ranks again. Now, I want to ask a question (going to display my ignorance in the first letter, you see.) Who was Poet-Laureate just before Tennyson? I wont describe myself this time, only say that I am an ordinary school-girl, between the ages of ten and twenty, and live in a little, *quiet*, not to say humdrum, village in the Empire State.

If Uncle True doesn't reject this letter, I will try to write a better one next time, and Uncle, please tell the Cousins how to direct their letters, and oblige LEONORA.

[Tennyson succeeded Wordsworth as Poet-Laureate. Address letters, Uncle True, Rural New Yorker, N. Y.]

Another Scouring-Board.

DEAR COUSINS,—If I may so call you, hoping that I may be accepted as one, as the rest tell their age, I will tell you mine. I am fourteen years old. Others have pets, I have none save one little sister, three years old. We live on a farm of seventy acres. I do not have a piece of land, as some of the cousins do, but my brother and myself pick up the chestnuts and sell them. We sold over two bushels last year. I thought I would try and make one of those scouring-boards. I made my aunt and my cousin one, and they liked it very well. But it was not like the one in THE RURAL. Have all the cousins gone to sleep, or where are they? Why do not they write? Where is young Bach? Have the girls shamed him out? Do not back out, we are as good as they. Let me hear from you all, boys and girls.

WILD WHISTLE.

The First Answer

DEAR RURAL:—May I be one of the cousins? I am a girl, fourteen years old, and live in Virginia. I have not noticed many letters from the cousins lately. Perhaps it is too hot to write. In regard to the novel question. I think a good novel once in a while does no harm; but when any one sits up 'till two in the morning crying over one, then I think it is time they ought to stop. The author of "She Stoops to Conquer," is Oliver Goldsmith. He also wrote "The Deserted Village," and The "Vicar of Wakefield." LIZZIE TAYLOR.

Lincoln, Va.

Only Two Years.

DEAR UNCLE TRUE AND COUSINS.—I have read your paper for one or two years, and I have been much interested in the letters from the Cousins. I should like to join you very much if UNCLE TRUE sees fit to put this in. I hope we shall hear from the Cousins often, and I should like to hear from UNCLE TRUE very much. ROBIN RED-BREAST.

The Puzzler.

HISTORICAL ENIGMA.

I AM composed of 101 letters:

My 5, 14, 66, 28, 58, 23 is a river in British America.
My 38, 35, 26, 98, 82, 8, 77, 45, 29, 70, 20 is a river in Canada.
My 34, 27, 2, 29, 89, 80, 92, 34 is a river in Russian America.
My 100, 90, 31, 86, 49, 96, 83, 10, 42 is a river in U. S. and Canada.
My 22, 81, 16, 27, 51, 54, 99 is a river in Birmah.
My 43, 79, 11, 25, 61, 88, 78, 72 is a river in Virginia.
My 24, 4, 85, 13, 6, 40, 93, 55, 95 is a river in Iowa.
My 59, 36, 19, 9, 71, 75, 53, 65, 18 is a river in Norway.
My 41, 50, 9, 21, 60, 47, 63, 48, 6, 87 is a river in Minnesota.
My 84, 67, 101, 44 is a river in England.
My 91, 33, 52, 12, 55, 64 is a river in N. & S. Carolina.
My 7, 57, 1, 17 is a river in Oregon.
My 68, 39, 37, 69 is a river in Colorado.
My 62, 30, 32, 46, 71, 16 is a river in Africa.
My 73, 3, 22, 15, 92 is a river in Russia.

CENTRAL PUZZLE.—"Judas Iscariot."

Sabbath Reading.

MY CONFIDENCE.

I HOLD Thy truth, O Lord, within my heart,
Thy law I love;
I hold Thy cross, and try to do my part
My faith to prove;
I hold Thy promise, Lord, and daily pray:
"My faith increase,
That I may closer cleave to Thee, the way,
And have Thy peace."
Yet little joy my holding brings to me,
Because I know
That, though my soul still trusting clings to Thee,
I may let go.

But I am held, O Lord; Thou hast my hand,
And Thou art strong,
Throughout my journey in this desert land,
However long,
Thou givest me support. I shall not fail.
Though foes assail
And press me hard, over myself and all
I shall prevail.
Great joy Thy presence and Thy pledge afford,
Because I know
That Thou wilt not—since Thou hast given Thy word—
Of me let go. [*Sunday Afternoon.*

THE GREAT HELP.

"Happy is he that hath the God of Jacob for his help, whose hope is in the Lord his God."—*Psalm* cxlvi. 5.

HAPPINESS is sought by all men. Some seek in one way, some in another. Many, in the gratification of self in one form or another, seek it in the wrong way and fail in their search. Others again are content to look for it in God's way—where God has placed it: these find and make it their own. David was one of these; he knew where and how true happiness is to be found; and, guided by God's Holy Spirit, he has left behind him directions for the seeker in every age. Let us look at the picture of the happy man, as painted by the hand of David thus guided.

The verse states, "Happy is he that hath the God of Jacob for his help, whose hope in the Lord his God." That man or child then is happy who has his help from, and his hope in, the God of Jacob. Now, to understand this, we must know the character of this God. What then was He to Jacob? This is the first question for us to consider.

If we look back at the life of the patriarch, we shall find that the first mentioned interview between him and his God is in the hour of trouble. In Genesis we read of him leaving his father's home. One false step, one sin, has led to this necessary exile. Behind him is his home, to which he may never return; before him the land of strangers, to which he is journeying. Well may he be sad! But we cannot pause longer at this point of Jacob's history; enough for us to know that he was in trouble.

As night sets in he tarries at "a certain place," and lies down to rest with no softer pillow than the stones the spot afforded. Before he laid down to rest, however, we can fully believe—though we are not told—that the son of Isaac knelt down in prayer to seek pardon from, and to commit himself to the care of, his father's God. Nay, indirect proof is given that he did so.

To return: while Jacob sleeps, God appears to him and comforts him with a promise—"The land whereon thou liest," etc. (Gen. xxviii. 13, 14.) What a promise, when we remember the Maker of it! It was Jacob's father's God who spoke it—One able to fulfil it, and One who did fulfil it; so we learn from the after history of Jacob. Then we see "a God of promises" was Jacob's God.

From this portion of the patriarch's history we learn too, indirectly, that He was a pardoning God. For had He not forgiven, in answer to prayer, the false step of Jacob in deceiving his father, He would certainly not have been with him to keep him in his ways.

Again, He stands before us in the character of a prayer-hearing God. Jacob himself tells us that "He answered him in the day of his distress," i.e. the day he left his home as a wanderer. We read, too, that when Jacob feared to meet his brother Esau, he prayed most earnestly to his father's God, reminding Him of His promise and was answered, after using all the means in his power to appease his brother's wrath. We find him on that memorable night wrestling with God in prayer until the daybreak, determined to get a blessing. In both cases he prevailed; in both he was heard and answered, for Esau was reconciled to him in a wonderful manner. Yes, the God of Jacob was preeminently a prayer-hearing God.

Lastly, a protecting God was the God of Jacob. Who watched over the patriarch in his journey to Pedaram, guided him to his uncle's house? Who protected him while there, and who watched over his interests? Who, while permitting him to be punished by means of retributive justice, as seen in his uncle's conduct, yet blessed him on his leaving Laban? Who protected him from his wrath? Again, who was it protected Jacob from the well deserved anger of his brother Esau, and turned the heart of that brother to Jacob? And lastly, when returning to Bethel, who was it protected him from the "cities" as he journeyed on his way? Who? None other but the God of his father Isaac—his own God.

O CHRISTIANS, how justly may that father be angry with his child who is unwilling to come home! and how justly may that husband be displeased with the wife who is unwilling to ride to him in a rainy day, or to cross the sea to enjoy his company? But is not this your case? is not this just your case, who have God for your portion, and yet are unwilling to die, that you may come to a full enjoyment of him?

WEAK Christians are afraid of the shadow of the cross.

PERSONAL ITEMS.

Victor Hugo says England produces wealth admirably, but distributes it miserably.

The actor Florence has been appointed on the jury for champagne at the Paris Exhibition.

Dr. Carver, the marksman, is engaged to a lady in New Haven, Conn., and will be married next autumn.

The sale of the jewels of Ex-Queen Isabella of Spain brought $720,000, and we wish we had our money back.

According to Darwin, our ancestors, the monkeys, were anything but ignorant, since they were familiar with all the higher branches.

Mr. Ira D. Sankey will take his family to England next month, and may spend the winter abroad, while Mr. Moody rests and studies at Baltimore.

The late Dr. Bigelow, of Boston, was asked by a lady if he thought tight-lacing led to consumption. "Not all, my dear," he replied, "it is what consumption lives on."

A guard of Bavarian gendarmes watches day and night before the closed door of the house of Prince Bismarck at Kissingen, and a line of telegraph connects his apartments with a police station.

Saratoga gossip asserts that Commodore Garrison, lame and nearly seventy, but worth from ten to twenty millions, is engaged to marry Miss Randall, of St. Louis, who is a brilliant brunette in the early twenties.

Mrs. Coates was conferring with a dentist about a new set of teeth. "The chewing capacity of these teeth is unsurpassed," said the dentist. "Maybe I can chaw with 'em," said the lady," "but can I jaw with 'em?"

Fame is priceless, but it brings its annoyances. "Jew," "adventurer," "Asian mystery," "arch Jingo," "charlatan," "mountebank," and "impostor," are some of the names given Lord Beaconsfield by the Radical press of England.

Being strongly urged by her father to retain the dowry of his late Queen, King Alfonso reluctantly consents to hold the Palace of Castilleja de la Cuesta, near Seville, and the jewels of Mercedes; but the money he received has been appropriated to the poor.

Senator Beck of Kentucky is 52 years old, weighs 222 pounds, and has never taken a dose of medicine in his life. He has left for the plains on a hunting expedition, and says that he can yet walk his thirty miles a day provided that some one will carry the game.

Mrs. Shoddy's views are interesting to those who are thinking about keeping a carriage. She says she has thought it all over, and come to the conclusion that broochos are almost too large, that these 'ere coupons are too shut up, but that a nice, stylish pony phantom seems to be just the thing.

Although Campbell says that "Freedom shrieked when Kosciusko fell," the Polish hero did not die in battle, but was killed by a leap of his horse over a precipice in Switzerland twenty-three years after the battle of Maciecwitz in 1794, where he fell wounded from his steed with the words, "This is the end of Poland!"

The Emperor William still shows the traces of the ordeal through which he has passed. His face is pale, and he has only begun to grow the white beard which was shaved off to allow the buckshot to be extracted from his face. He is learning to write with his left hand, the right having been injured permanently by Robeling's shot.

Professor Leone Levi of the University of London believes that the troubles of the English workingmen are caused largely by their own vices. They earn in the aggregate $1,500,000,000 in cash annually, of which they ought to save $75,000,000. As a matter of fact they save only $20,000,000. The bulk of the missing $55,000,000 is wasted mostly in drink.

Nothing is too good for the Earl of Beaconsfield just now. When he went to Osborn the other day to visit the Queen he traveled in one of the royal saloon carriages, the superintendent of the line drove the train, as he does when the Queen travels, and the platform in Victoria Station was covered with crimson cloth. No wonder Mr. Gladstone is disturbed.

Edison's visit to Nevada has given him a new idea. He thinks that the size, character, and point of croppings of a mineral lode may be determined by the difference of the conductivity of electricity, provided that the walls of the ledges are lined with clay or decomposed rock. He will test his theory on the Comstock lode when he returns from California. Should his plan prove practical, instead of running long tunnels, sinking deep shafts, or boring here and there with the diamond drill, a miner would apply the electrical apparatus, and thus find out how much ore there is in a mine, where it lies, its direction, and the point where its cropping may be looked for.

John Brown, the trusted servant of the Queen, is said to owe his popularity to the fact that the majority of English servants, from the palace to the plain residence in England, are great sticklers about their proper duties. If the Queen has to go anywhere, have anything done from getting a cup of tea to the packing of a trunk, from the selection of a horse to the purchasing of a book, John Brown is always on hand, ready, able, and willing to bound over all the barriers of red tape and formal deportments, and get and do these things, or see that they are done promptly and properly. By this readiness and untiring attendance he has ingratiated himself with the good Queen, who fully values his honest energy and integrity, and who has thus made him her favorite gillie.

TO ADVERTISERS! We fill orders for the insertion of advertisements in the newspapers of the United States and Dominion of Canada. To furnish advertisers with reliable information concerning newspapers and their rates, and thus enable the most inexperienced to select intelligently the mediums best adapted to any particular purpose, WE ISSUE SEMI-ANNUAL EDITIONS OF
AYER & SON'S MANUAL
FOR ADVERTISERS. 164 8vo. pp. Gives the names, circulation, and advertising rates of several thousand newspapers in the United States and Canada, and contains more information of value to an advertiser than can be found in any other publication. All lists carefully revised in each edition, and where practicable prices reduced. The special offers are numerous and unusually advantageous. It will pay you to examine it before spending any money in newspaper advertising. The last edition will be sent postpaid to any address on receipt of **25** cents by **N. W. AYER & SON,** ADVERTISING AGENTS, Times Building, Philadelphia.

Wit and Humor.

HOW HE DID AN ERRAND FOR HIS WIFE.

"Now, Leander, my dear, I want you to be sure and not forget these few things when you come down to-night," says the young wife, just before the kiss and "good-by," at the summer hotel in the morning, as the gentlemen were starting for the city.

"Certainly not my love."

And this is the way the list ran:

1. Two yards of blue barege.
2. Three yards Hamburg edgings.
3. My new braid from the hair store.
4. Half a dollar's worth of nainsook.
5. Box pearl powder from my upper drawer.
6. "Modern Minister" from Loring's library.

Arriving in town, he forgot all about the list till late in the afternoon and then could'nt find it in any of his pockets; but hadn't he read it over, and didn't he recollect it all? Of course he did, and this is what he brought home to his expectant wife:

1. Two heads of blue cabbage.
2. Three yards of handsome notting (mosquito.)
3. Some blue braid.
4. Half a dollar's worth of canned soup.
5. Box of sedlitz powder.
6. Loring said he hadn't any such book as the "Mug and Canister" in the library.

Exclamations on receiving the above, "O, Leander, Leander, you must have been dining at that horrid club again or you couldn't have made such a mistake!"—*Boston Commercial Bulletin.*

"Two heads are better than one," said the thief, as he crawled out of the cabbage patch.—*Derrick.*

SINGING is recommended as a cure for seasickness.—*Buffalo Express.* A good ballad for marine stomachic difficulties would be, "I give thee all, I can no more, though poor the offering be."—*N. Y. Commercial.*

MIND your stops. A compositor in setting up the toast: "Woman—without her, man would be a savage," got the punctuation in the wrong place, which made it read: "Woman—without her man, would be a savage."

SARAH ANN—"O, ain't my brother a clever boy, Eliza Jane? He's only been to school two months an' he's got the catechism." Eliza Jane—"Wot's that! Why, my brother's on'y bin to sch ol two weeks an' he's got the measles!"

In winter, rugs;
In summer, bugs;
In sickness, drugs;
In adversity, shrugs;
In thirst, mugs:
In courtship, hugs.

THERE is a terribly depraved joke about the lamb lying side by side with the lion. It was a dande-lion. The perpetrator thereof ought to have a "consulship in a warm climate." The thing Jim Anderson, the Louisiana witness, wanted.

"SAM, you are not honest. Why do you put all the good peaches on top of the measure and the little ones below?" "Same reason, sah, dat makes de front ob your house all marble, and de back gate chiefly slop bar'l, sah."—*St. Louis Journal.*

HE said the pastry was ever so much better made by her hands. This delighted her. But when she wanted the coal-scuttle at the other end of the room, and he suggested that she should get it, as the fire would feel so much better if the coal was brought by her dear hands, she was disgusted. Women are so changeable!

AT a ball at Long Branch, there was an immense concourse of people. A lady who had been jammed against the side of a hall in the crowd, accidentally caught the trimming of her cloak in the button of a gentleman's coat. After having been towed around a few moments in this sort of style, she remarked to her involuntary captor, "I'd thank you, sir, not to pull my cloak all off me!" "Good gracious, madame!" he replied, "I hope you will excuse me; but I'm just as anxious to keep my clothes on as you are."

A Healthy Body and a Clear Head.

If indigestion, constipation and billiousness torment the body, the head cannot be clear. These disorders react upon the brain most hurtfully, and produce a cloudiness in the organ of thought not experienced by a healthy man. Happily these brain-oppressing maladies may be entirely dispelled by that peerless alterative, Hostetter's Stomach Bitters, which cheers, refreshes and invigorates the brain and nerves, while it regtiates the organs of digestion, assimilation and billous secretion. It expels the morbid humors which poison the system through the bowels and urinary passages, and exerts a powerfully invigorating influence as well. Its catharic action is never irritating, violent or painful, but even, natural and progressive. As an appetizer and sleep promoter the Bitters is unrivalled; it mitigates the infirmities of old age, relieves the ailments peculiar to the gentler sex, arrests premature decay, and builds up an enfeebled physique.

NOTHING EVER LOST.

Careful Housewife, (Lifting a shoe from the soup turreen).—"La! who'd a-thonght baby's shoe would turn up in the soup. But I knew it wasn't lost. I never lose anything!

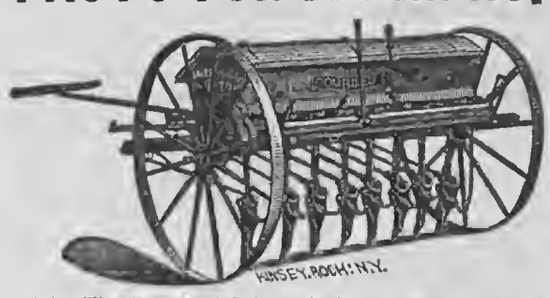
FACTS FOR FARMERS.



1st.—The Centennial Commission MADE BUT FIVE AWARDS to Grain Drills and Fertilizer Attachments.

2d.—Of these five, TWO were given Bickford & Huffman. One on the FARMER'S FAVORITE and one on Fertilizer Attachment.

3d.—NO OTHER MANUFACTURERS RECEIVED AN AWARD ON A FERTILIZER ATTACHMENT!

4th.—The award to the "Champion," built by Johnson, Gere and Truman, was "for a machine with attachable manure distributer;" an implement they did *not* exhibit and *do not offer for sale*, as their "manure distributer" is neither "attachable" nor detachable. The report does *not* commend this drill or its "manure distributer" for a single quality of work.

5th.—The award to the Farmer's Friend pronounces it defective by saying *it is capable of further improvement, as regards delivery up and down hill;* and also to the McSherry drill in these words: "*Some further adjustment appears desirable to enable this drill to deliver with equal equality up and down hill.*"

6th.—The Empire, Buckeye Hoosier, Superior and Hagerstown drills were *refused* EITHER AWARD OR REPORT, because of great "irregularities" or "variations" in the tests.

7th.—The variation of our nearest competitor, The Champion, *from its own distribution*, was MORE THAN 237 PER CENT. of that shown by the FARMER'S FAVORITE.

8th.—The award to the FARMER'S FAVORITE, distinguished it by commending it for "ACCURACY OF DELIVERY, AND REGULARITY OF DISCHARGE UNDER DIFFERENT CONDITIONS," and "REGULARITY OF DELIVERY UNDER ALL CONDITIONS." Qualities conspicuously lacking in its competitors.

We challenge contradiction of a single feature of the above statements.

Fully 80 per cent. of all the Fertilizer drills in use on the American Continent are built under our patents,—a fact that tersely and undisputably establishes superiority. For circulars, prices of information see our agents, or address **Buckford & Huffman, Macedon, N. Y.**

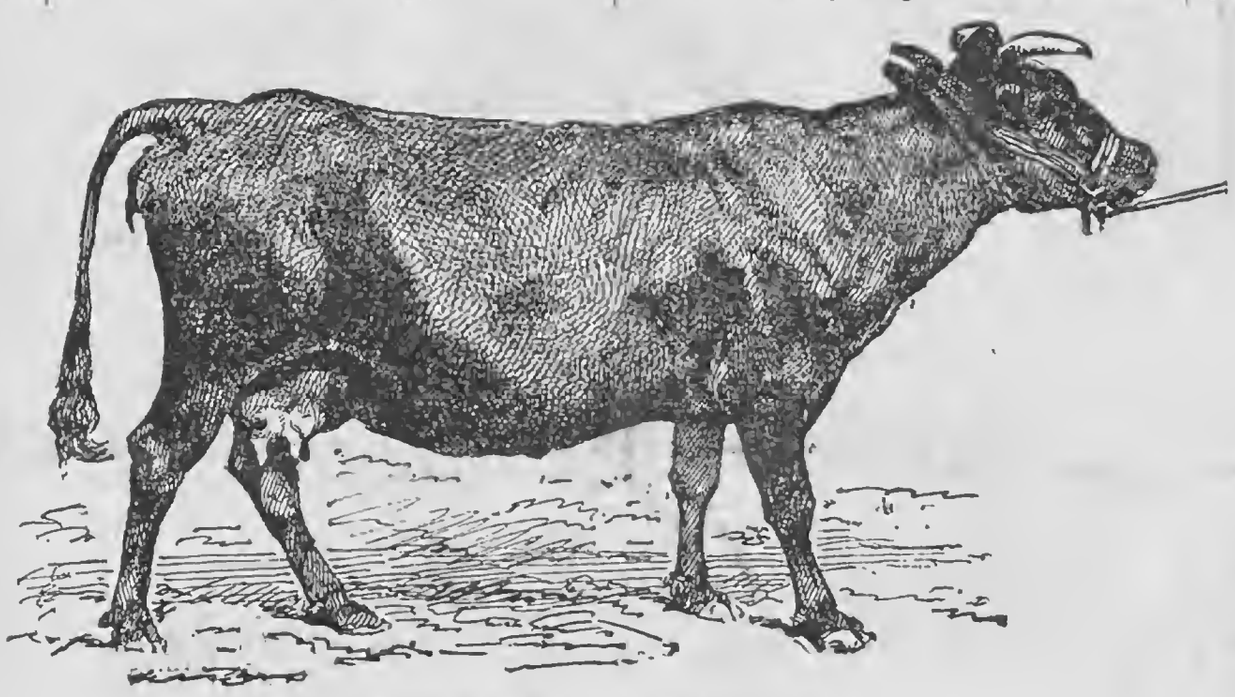
The Herdsman.

PRIZE CATTLE AT THE PARIS EXPOSITION.

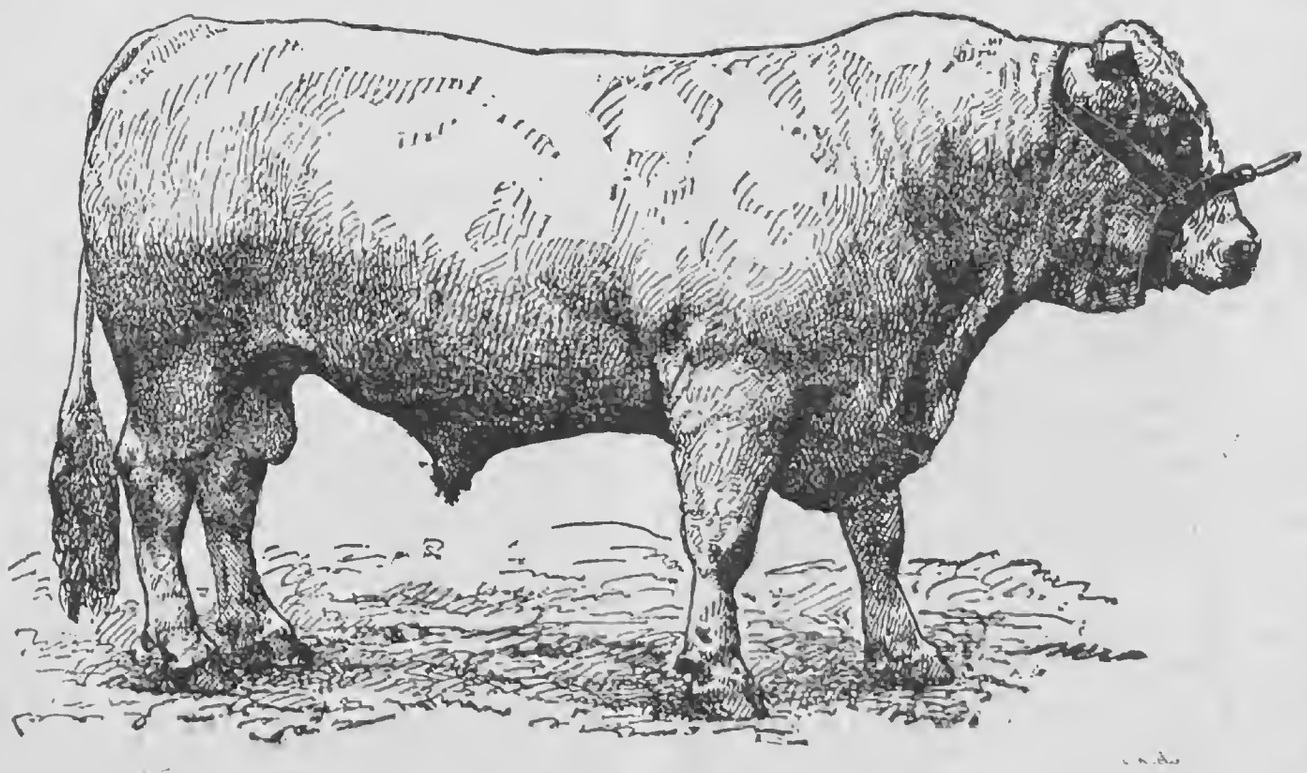
THE portraits which we present are engraved from photographs taken at the Paris cattle show for the London Agricultural Gazette. The Gazette says that the cow, 7 years and 3 months old, is the property of M. le Comte de Krag Juel Wind Frys, of Halsted-Maribo, Denmark. (This is copied from the official catalogue.) She is of the small red Danish breed, of which about ten specimens were exhibited, making, however, a great impression as to their qualities as a dairy breed, *i. e.*, as to their power of converting all their food into milk. They were in a perfectly healthy and prosperous condition, but as nearly mere skin and bone as any animals in a condition for exhibition well could be. This particular cow is one the editor happened to measure. She is 56 inches long, taken in the usual way from the front of the shoulder to the perpendicular line representing fairly the outline behind; and, as she stood, there was no projection of the bosom beyond the point on the shoulder to which the measure reached. She girthed 5 feet ten inches at the narrowest part behind the shoulder, and 7 feet 7 inches round the abdomen. Her back was 45 inches high at the shoulders, and the belly line immediately below that point, was 19 inches from the floor.



A PRIZE DANISH COW.

The bull, two years old, represents the massive Charolaise—the breed which probably, of all the French breeds, most nearly corresponds to our own Shorthorns, being, as a general rule, shorter, and, if one may say so, chubbier. The Charolaise breed is white and Short-horned, and carries a good quality of meat on a very symmetrical and well-made frame. This particular animal, it will be seen, possesses a good rump and thigh, and is good over the loins, fairly well covered on the back and crops and sides and well filled up both in front and behind the shoulders. He shows also a fairly good bosom, wide and fleshy. He is not well covered along the lower part of the sides—the flank and plates and chest. Of the bull here represented, No. 640 in the catalogue, the Ag. Gazette gives the measurements. He girths 7 feet 3 inches behind the shoulders; his back is 48 inches, and his belly line 22 inches from the floor at the same place, and his length taken as before, is 64 inches.

The Charolaise breed may possibly have had and may hereafter have a cross of the Shorthorn. The white color is an essential feature of the breed; and if, by the aid of Shorthorns—white for several generations, and not likely, therefore, to transmit any other color—the breed could obtain extra size and earlier maturity without losing hardiness of constitution, it is probable that good would be done. Mr. Thornton acting on a French commission, has procured bulls of the necessary character for this purpose, and no doubt enterprising French breeders will try experiments. But we can easily excuse the conservatism of those who, satisfied that they have already got an admirable breed in their hands, whether for labor or for beef, should prefer to seek its improvement by care and good judgment, without going beyond the limits of the breed itself for the means.



A PRIZE CHAROLAISE BULL.

THE WILD CATTLE OF CHILLINGHAM, England, are supposed to have descended from the ancient urus, whose immense size may be gathered from the fact that the skull of a urus found in Scotland, now in the British Museum, measures a yard in length, while the span of the horn cores is three feet six inches. The Chillingham breed is of a white color, except the tips of the horns, which are dark; and the ears and muzzle which are red and brown respectively. Uniformity of color however, is secured by the slaughter of all calves which differ from the pure type. They hide their young and feed in the night, basking or sleeping during the day. They are fierce when pressed, but generally very timorous, moving off on the appearance of any one even at a great distance. The bulls engage in fierce contests for the leadership of the herds and the wounded are set upon by the others and killed. Thus few bulls attain a great age, and even these when feeble are gored to death by their fellows. A breed similar to the Chillingham cattle, existed in Wales in the tenth century, being white with red ears; and Welsh chronicles relate how, once upon a time, a Prince of Wales demanded as compensation for certain injuries, 100 white, or 150 black cattle.

Farm Topics.

FARM MUSINGS.

WHERE IGNORANCE IS BLISS 'TIS FOLLY TO BE WISE.

If a man thinks he has the best home in the world, he must from thinking so, be a happy man and it would be folly indeed to try to make him feel otherwise. If the same or any other man imagines he has the very best managed farm in this world, or in any other, it would be a pity to undeceive him, unless the farm was held up as a pattern and was really calculated to mislead in such a way as to injure the prosperity of agriculture generally.

A MODEL FARM.

There is such an instance in Australia and, some years ago, a man went to see it. Having gone by railroad, on arriving at the place, the conductor stopped the cars and let the visitor get out at a station used for the convenience of the farm. It was at the foot of a mountain, and the land near to the depot was in an extraordinarily rough condition. It had been fenced into small fields by a former owner, but now the walls lay scattered about in all directions, the best stones having been fetched away and the useless ones left. The whole surface of these fields was about half covered with fixed stones, some of which could be pried while others required blasting. In addition to this covering with stones, brush-wood and briers occupied all of the ground best fitted for grass, and in some places water coming from springs on the hill-side, ran over the surface so that while the land remained in such a state no improvement was possible.

Some meadows came next into view, which had a brook running down the middle; on each side of this were many acres covered with all kinds of weeds, and moreover this wild, disgraceful-looking ground had all the top soil washed away by changes in the course of the stream which was still making farther inroads, sometimes on one side and then again on the other side. In the meadows there were also several large holes half-full of stagnant water and bordered with weeds and brush, while in two or three places a few acres had been plowed. The rest of the fields also had very unsightly holes and ditches in them, and, excepting some new walls by the roadsides and a little fencing around paddocks, there was no kind of protection to crops or any means of making the best of pasture.

Yet such a farm in Australia, is called a model farm, and a native who knows nothing whatever of modern breeds of cattle, modern improvements in agriculture, under-draining or application of manure, has charge of this one and thinks it the finest in the world.

FACTS.

are said to be stubborn things. There are some which are difficult to understand, and by stating a few of them, it will be seen that in many respects they are stranger than fiction.

If a man has a fit of sickness, his cheeks will become very hollow, and if a cow ails it is said her horns are hollow and an operation is generally proposed by the good old farmer and his neighbors; but nobody does anything to the man's cheeks, nor does a doctor call the sickness "hollow-cheek."

When it was reported in the newspapers that MR. BERGH had been trying to have a man punished for cutting a horse's tail off, it made me think of the evil which is said to exist in a cow's tail, and that it would have been a good defence to have said the horse had the "tail-evil" necessitating the cutting off of that appendage.

Is is well-known by everybody that an American is altogether much better able to manage live stock and farms generally than a native of any other country, yet how is it foreigners are so often put in charge?

It is conceded Americans are much more inventive than any of the inhabitants of other countries and are more industrious—why, then is it necessary to pay protective duty which robs every one furnishing a house with crockery, cutlery, bedding etc., also all those who require and use agricultural implements and wearing apparel.

It is said this foolish protection is the cause of England doing all the carrying trade: for Americans are not allowed to buy ships where they are cheapest, consequently England can convey every kind of merchandise much lower, and by doing so there is comparatively nothing done by the shipping of the United States. Protection gives the manufacturers of New England a great profit on the cotton and other goods made there; but all the customers they have are their own countrymen, for other nations will not buy of them when the English sell about 30 per cent lower. It is thus Americans try to raise tax on English manufactures and foreign articles of every kind, in doing which they cause the necessaries of life to be dearer than elsewhere, so that the cost of living is heavier than in older countries.

Education is cheaper and boys and girls are kept at school much longer here than in England, yet almost all the rural population still believe the moon will have an evil influence on wounds, on vegetables planted and on meat cured at certain stages. A farmer's daughter, next house to ours, always has her meat cut when the moon is at full because it would grow better. Another neighbor, and there are many like him elsewhere, will not commence any new work on a Friday.

AN OLD HAND

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

A GENTLEMAN called to-day to see the pigs. He remarked that he thonght "a swill pail was the best breed." We replied we could show him "swill pails," and that "it was not much satisfaction to show any one different breeds of pigs, who had such an opinion." Before we got around he said "there was a difference in pigs," and "it was not all swill pail." We confess his first remark was not a very pleasant "send-off" to go the rounds of the pig pens, for in any case snch talk is not agreeable to a man who has spent hundrods of dollars trying to improve and perfect pigs. It shows a lamentable ignorance of the characteristics of breeds or a determination to hang on to old notions and prejudices, which are a disgrace to the man and the age in which he lives.

Mr. David Wicks is removing the old picket-fence in front of his house. The house is large and built of brick and surrounded by trees. The effect of taking away the fence and opening up the grounds to an unobstructed view is a vast improvement. The fence had stood forty-five years and was getting dilapidated. He is going to follow the example of several others on the same street and not have any fence in front of his house, and so improve the appearance of the place and save the expense of a new fence. The law in New York makes its unlawful for animals to run at large on the highway, and so a road fence is not necessary. If any one must have a door-yard fence, the prettiest kind is to make it of wire number nine, which is bent in the form of pickets and run through ribs. It is durable, much more so than pickets, and not any more expensive. It has a light and airy look, and does not hide the yard or grounds as a more clumsy fence will do. The end posts should be square and solid and not large. The old-fashioned cased post is going out of style and ought to, for it is not in good taste, unless expensive things are considered in good taste, without reference to durability or harmony. As a rule, the simpler the surroundings and the less fuss about a farm-house, the better it will look. Beauty does not consist of a lot of fences, and gravel walks full of weeds and grass, but is rather found in an open lawn well cut, on which the eye may glance with vistas unbroken, save by the house or the fields and sky beyond.

If we have made a discovery, or if everybody knew it before us, we will tell it all the same. As soon as the cream shows signs of "coming," pour into the churn two or three quarts of water—as near ice-cold as it is possible to get—and the butter will gather a great deal quicker and come hard and firm. We tried the cold water (ice water) on the start and found it made the cream too cold and kept the butter from coming; but put, in at the last and it is a capital idea and will save hours of churning in the course of the season. Butter will come in fifteen or twenty minutes, as a rule, if the cream is in the right condition and temperature. A cool cellar is cool enough to start the churning, and as near right as most farmers can get it without thermometers and ice, and cold well-water will lower the temperature for gathering. The temperature of our cellar is 64 degrees, and the butter invariably comes quick with the help of the cold water, which is probably two degrees colder. When the cream stands too long on the milk before skimming, the butter will not come so quickly and it is always poorer, and such butter will not keep well. This is one reason, and the main one, why there is so much rancid butter. Better churn oftener and have good, sweet butter, and skim oftener also.

How pleased we are that the English walnuts, planted last fall, are coming up and doing well. The two trees set last year are also growing finely. If we can get these excellent nuts up here in our high latitudes it will be an event. There are now none nearer than Westchester County, not far from New York.

A hen was driven from the nest, where she was sitting, by the myriads of lice on her. We found her drooping and weak, and rubbed powdered sulphur all through her feathers, and shut her up in a coop with three inches of dry ashes over the bottom. We have since been told that a little kerosene oil poured on the roosts, and in the nests, will clear lice away; a little put on the body would do no harm, and would, undoubtedly, clear out the lice.

NOTES FROM MAPLEWOOD FARM.

HECTOR BERTRAM.

SOWING WHEAT.

IT is time that land, calculated for wheat, should be in course of preparation for the reception of the seed. Many of us do not sow our wheat early enough. Last fall was an exception; but, as a general thing, wheat sown in the latter part of September does not, on the hills, obtain sufficient top to protect the roots before cold weather checks the growth. I have noticed the best results, in this locality, from that sown the very first days of September, or the last of August. There is much less danger of the plants getting too large a growth in fall than not enough, and the field may be pastured off if too forward, although this is scarcely necessary. Great care should be exercised in the selection of seed. It should be perfectly clean, and free from the seed of all noxious weeds. The seed from a single plant of cockle, scattered over ten acres, will nearly spoil the crop of wheat for market. Clawson has lost favor with us. It brings less in market than many varieties, and, unless cut quite green, shells badly.

I learnt something about sowing broadcast by hand this summer, and shall hereafter, when sowing by hand, follow this plan: Instead of the usual manner of sowing around a land, sow four paces wide across the field with one hand, then back with the other, throwing the grain all one way, and with the wind, if possible. Grain can be sown much more evenly and rapidly in this manner, and although to some it may prove rather awkward at first using the left hand, a little practice will overcome this difficulty; at least I found it so. Farmers differ as to the amount of seed required per acre, some sowing two bushels or two and a half, while others claim one and a half bushel to be amply sufficient. If the grain is threshed by hand, one and a half is probably plenty; but machine-threshed grain is injured to quite an extent, at least so much so that much of it will not germinate, and therefore it should be sown thicker.

Manure can be applied to wheat with returns as good as any crop yields, and it is the one where top-dressing is most practicable, I think. Besides the beneficial effects upon the soil, it forms a useful protection to the roots of the plants. The best wheat land is that strongly impregnated with lime and to that which lacks this element, the fertilizer should be applied, if large returns are expected. Wheat land should be well under-drained, and in localities where field-stones are plentiful, they answer the purpose almost or quite as well as tile, and are much more easily procurable.

In the assertion in regard to lime, I do not wish to be understood that it is impossible to raise a crop of wheat without it, but that the largest crops are raised on soil of which lime forms a prominent ingredient, either naturally or artificially. Probably no fertilizer will show its beneficial effects upon the soil for so long a time, which fact makes it one profitable to apply, even where it commands a medium price.

REMOVAL OF WEEDS AND STONES.

August is *the* month for cutting briers, weeds and thistles. Even fallows cut now will sprout less than at any other season of the year. It is a fine time for farmers to clear out the corners of the old zig-zag, rail fences. The weeds and briers should be gathered into heaps and burned, thus removing the unsightly nuisances entirely. The best time to remove loose stone from meadows, is immediately after haying, before the aftermath conceals them. Those of any consequence are loosened by the rake, and seem to invite a removal. It is much better in drawing them, to have them laid into a wall immediately, turning what before was a nuisance into a benefit. I noticed a wall which had stood many years uninjured, the durability of which was attributed to two layers of split white-oak staves, laid cross-wise, one a foot and a half from the bottom, the other a foot below the top. The wall was built three feet thick at the bottom, four feet high, tapering to a foot in width at the top. The staves bound it perfectly, and the action of the frost in spring had no injurious effect upon it, which is generally the most serious difficulty attending building a permanent and durable wall, on hill land.

RYE SOWN WITH BUCKWHEAT.

Last year Mr. Parcell sowed a bushel of rye with his buckwheat, and I watched the result with no little interest. The buckwheat did finely, giving a good crop. After this the rye, which had come up nearly as fine as timothy, began growing more stocky, and looked well in the fall. This year he harvested, rather earlier than usual, a fine crop; the best, he informed me, that he ever grew. The rye was nearly a complete profit, requiring no labor for plowing or seeding.

SUPPLEMENTARY FALL FOOD FOR MILCH COWS.

At this season, owing to sun-burnt pastures and the unceasing diligence of flies, cows are very apt to shrink of their milk and grow poor in flesh as well. A small piece of sowed corn for soiling, fed nights, the only time cattle can feed with any degree of comfort, will keep up the flow of milk and keep the cows in good condition, until fall pasture gets well started. Mr. Schutt sows the Horse-tooth variety, as furnishing much more feed than the other sorts, the foliage being denser.

NOTES FROM A BACKWOODS FARM.

FREEDOM, Outagamie Co., Wis., Aug. 15.

CROPS.

THOSE farmers among us who were so fortunate as to have winter wheat, have harvested a splendid crop. Spring wheat is badly injured. First, the weevil damaged it to some extent; then the hot weather and rain seemed to ripen up the grain prematurely; the heads were soft and light; some fields were hardly worth cutting; others may possibly yield ten bushels to the acre. Altogether there will scarcely be a third of a full crop in this part of the State. Barley was sown here quite extensively last spring; the crop and the price are both good. Oats promise an average crop, although there was not so large an acreage as usual of this grain. We have cut more hay this year than ever before in one season. The hot weather has brought corn forward so that it is just big. It is caring up finely and promises a heavy yield. Potatoes do no not promise very well. I think the heavy rains have been too much for them. A light crop and high prices. The beetles have not been very numerous this season; about one or two applications of Paris-green have kept them under. The weather during haying and the most part of harvesting has been hot, with frequent heavy rains. A little cooler now.

FARM MACHINERY.

But a few years ago our farms were covered thick with stumps, now we could hardly secure our crop without the aid of farm machinery; it is used on almost every farm. Good farm laborers are scarce and hardly to be had at any price. Threshing machines are beginning to run now. Spring wheat is yielding from five to fifteen bushels per acre, while winter wheat will go from 20 up to 30 bushels per acre in some fields.

BEE NOTES.

Starting with seven swarms last spring, I have now 16 strong natural swarms. I have taken from them 100 pounds extracted and about 200 pounds of cap honey with a few more caps to be removed yet. I do not propose to rob my bees for the sake of making a big show in honey, always making it a point that my bees shall go into winter quarters strong in honey. Honey is cheap this year, only selling at 10c. for extracted and 15c. per pound for box. The home market is the best, as my neighbors, although afraid of bees, like honey, and think they can afford to eat it at present prices. JOHN RUSTICUS.

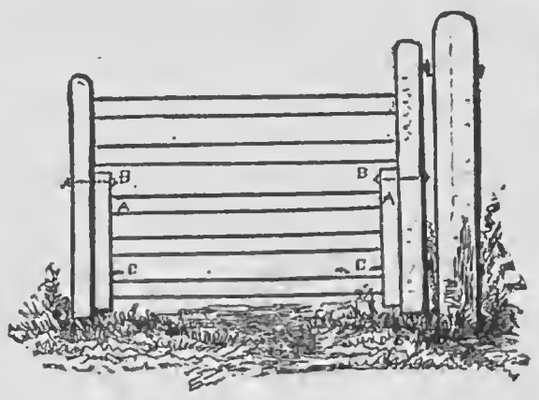
Farm Economy.

NOVEL AND USEFUL FARM GATE.

I HEREWITH present to the readers of the "RURAL" a drawing and description of a farm gate possessing novel and useful features.

Not long ago, I published a description of a gate of my own invention, in which, by means of a lever, the whole gate could be raised bodily from the ground to clear obstructions of snow, etc.

In this gate, recently designed, and which, I think, the accompanying cut clearly illustrates, the main part of the gate swings around upon



its hinges in the ordinary way; but there is an auxiliary part, shown at A.A., which is hinged or pivoted to the main gate by the bolts B.B. and free to swing on the same, except when fastened by the pins C.C. When it is desired to clear obstructions of snow, etc., the auxiliary part may be turned up on its pivots, and held in place by means of a strap or cord and hook. Also, when it is desired to allow free communication between one inclosure and another, for small animals, like sheep and pigs, or to drive the same through, and yet by the upper gate obstruct horses and cattle. It will be seen by the intelligent readers to be a very convenient device. I offer it for their use freely.

PROF. WILLIAM R. BROOKS.

Ontario Co., N. Y., July 30, 1878.

DRAINING THE SALT MARSHES.

THE value of lands now lying useless along the sea-coast and which can easily be drained and reclaimed by shutting out the tide and otherwise using the tidal flow for pumping, is almost above computation, and should be made to give employment to many idle people at no distant day. These salt marshes extend from Maine to Texas, but not with sufficient rise and fall in the tide at some southern points to complete the work by utilizing the tide alone, while the swamps under a hot climate are less habitable. But from the Chesapeake to Maine, the work of reclaiming the land is practicable, and when so done will add very largely to the acreage of fertile lands adapted to market gardening, cranberry growing and other crops. The success of reclaiming land in Holland is well known, and a few instances exist in the rice lands, the cranberry swamps and some other places in this country. The Marshfield Marshes in Massachusetts, to the extent of 1,500 acres, have been drained simply by shutting out the tide and fixing a gate for the outflow of the inland waters. Several thousands of acres have been partially dyked in the Hackensack, New Jersey, Meadows, both showing plainly what good results may be made to follow a perfect drainage of these lands.

Where lands are below the usual low water, the ebbing and flowing of the tide may be made to work pumping machinery steadily and economically, thus insuring a drainage of such lands. In this connection a suggestion of a simple manner of utilizing the tidal power may be valuable. The turning of a turbine wheel by the incoming and outgoing tide would be easily practicable during the time the tide was ebbing or flowing, and to insure the power while the tide was at its hight it would only require an additional empty basin to receive water while the tide was thus stationary, and the reserve of a basin to be emptied while the tide was out and stationary.

The construction of these basins would be the chief expense of the operation aside from the wheel and pumping machinery, as the work could all be make automatic or there might be an attendant. The importance of the work in the New Jersey swamps would be sufficient to warrant the employment of an attendant at nights, and another during the day, and a systematic prosecution of this work. The 250,000 acres of land which could here be brought into service as the best possible for market gardens, would bring an enormous income to the association which perfects the work. These additions to the industrial operations of the country will be absolutely required by and by.

Field Crops.

THE TOBACCO PLANT.—No. 4.

E. R. BILLINGS.

SELECTION AND USE OF FERTILIZERS.

THE tobacco plant, (more particularly cigar varieties,) requires the most fertile soil attainable. If not made fertile by the Creator then the grower must make use of manure in no stinted measure. Tobacco takes from the soil its most fertile elements and, like the grave, cries "give, give." We find, because the early Virginia growers did not so do on the rich soil of the old Dominion, that repeated crops soon laid waste their fields, and the fertile valley of the James became as barren as the sand flats along Cape Cod. In New England from 10 to 12 cords of manure are applied to the acre, or some 60 loads. In the South patent manures are used, as is also the case in Cuba, though in the latter the leaf is said to be injured in flavor by so doing. In Syria where Latakia tobacco is grown, the dung of goats is used, and a fine leaf for the pipe is secured. In Japan liquid manure is used in the cultivation of some five or six varieties grown in that country. In nearly all countries the tobacco ground is heavily manured. In Mexico when the Indians grow the plant, they select a rich clearing in the woods, thereby obtaining fine plants.

Of the great variety of fertilizers used doubtless the excrements of animals are the best and do not permit the soil to be so readily impoverished. Horse manure makes the lightest-colored leaf, and hog manure the darkest. Tobacco stems—four tons to the acre—produce a dark leaf of good texture and grain. Of the patent manures we have nothing to say, as we do not believe in their use on tobacco lands although from 300 to 500 pounds of Peruvian guano to the acre will doubtless give a good color to the leaf.

Tobacco stems may be applied, half at least, in the fall, and the balance in the spring. Stable manure should be thoroughly composted and plowed under and replowed to the surface afterwards, if thought best. When Havana seed tobacco is planted this will be the better way no doubt. Manure is also applied in the hill to hasten the growth of the seedlings. Clear manure is the best, free from all litter of any kind, not that such matter injures the plant, but only that the genuine article will produce the finest plants.

Some growers use the same field for several years in succession, claiming that a finer leaf is secured by so doing. I have seen planters try to grow a crop of tobacco without the aid of very much manure, but they have never succeeded. Doubtless some varieties require more fertilizers than others, but there is no sort with which I am acquainted that does not need a large supply in order to yield fine leafy tobacco. Formerly in New England growing crops were used to help enrich the soil, and there are some growers that do so now. Usually rye is the favorite crop to turn under, and when it is sown very thick it answers the double purpose of plant food and affords moisture. Decomposed manure is necessary for the immediate growth of this sturdy-growing plant as well as for all plants. Green or raw manure cannot be made available

for plant-food until it begins to decay. The tobacco usually matures in from 10 to 12 weeks, and it is necessary that the young seedlings should be provided with plant-food in the right condition in order to give them a "start," as old tobacco growers say.

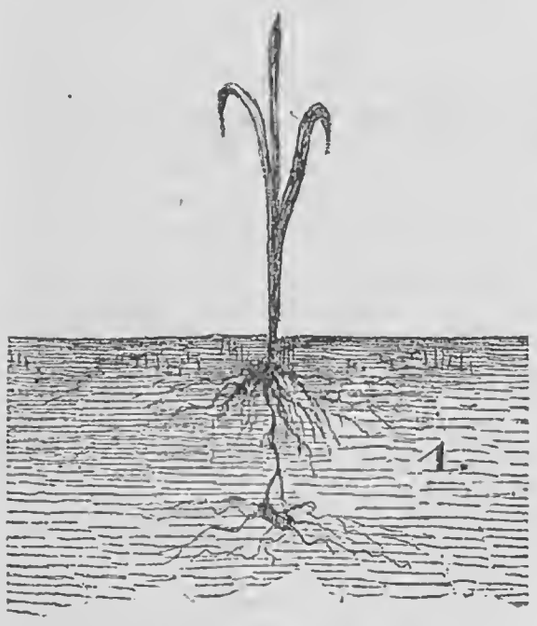
The Massachusetts growers, a few years since, tested very many kinds of fertilizers, such as cotton-seed meal, Indian meal, &c., and in some instances with considerable success. I would not recommend, however, the use of any great amount of fertilizers of the latter kinds by way of experimenting, until the grower is satisfied that his land is adapted for the use of such manure. Old tobacco planters say, and with truth, that stable manure is the best plant-food attainable, and years of trial with this and all other fertilizers help to convince our growers of the truth of the assertion. I know of but one other article used that will approach it, and that is tobacco stems! When used wholly to grow the crop, or in part, fine large leaves are obtained, and the results everyway seem to be the same as when grown with ordinary farm manure. The fertilizing of the tobacco ground is one of the most important things to be considered, as the application of plant-food will determine the quality of the crop. No one in New England should think for a moment of raising the weed without a heavy dose of some kind of manure. All who think otherwise are not at all acquainted with the habit of the plant and the enormous demands it makes on the fertility of the soil.

THE FALL WHEAT CROP.

BY A JERSEY FARMER.

THE WHEAT PLANT.

ALTHOUGH the majority of farmers do not find the wheat crop profitable, yet there is no way of avoiding the necessity for growing it. Fall grain of some kind is at the foundation of our system of agriculture, for it is the best preparation for getting the land into grass again. Besides, wheat is the "staff of life;" and what would the world do without its bread? What is necessary to be done should always be done in the best and most effective manner. If, then, the wheat crop is a necessity in our system of agriculture, it should be grown by the best possible methods. Thus grown, it may be made



1.

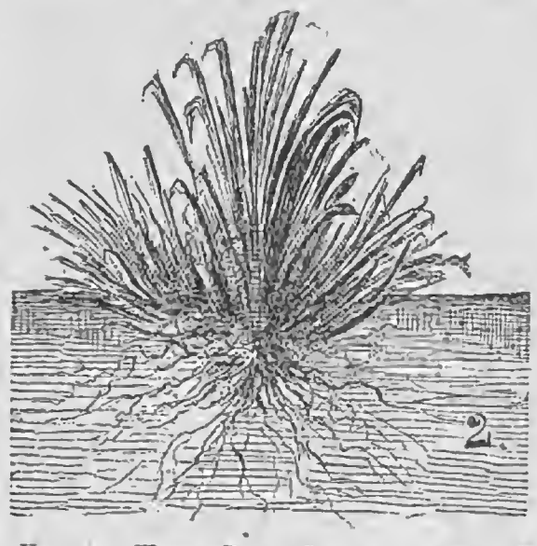
YOUNG WHEAT PLANT.

profitable even at present low prices. For the thorough understanding of the best system of wheat culture, the character of the wheat plant should be well understood, and it well deserves study. Wheat belongs to the family of grasses, and to that variety of them known by the botanical name of Triticum. This variety has a habit of spreading from the root as is well known in winter wheat and the related species, the common Quack-grass; although the manner of growth in these two differs somewhat in character. If a young wheat plant is carefully removed from the ground it will be found to have two sets of roots, one of which springs from the seed, and the other from a bulbous enlargement near the surface of the ground. As the latter set grows and becomes vigorous, the former dies away, and the plant depends for sustenance upon the surface roots.

The manner of root-growth is shown at Fig. 1. Here the young plant is just appearing above the ground; and having exhausted the nutriment furnished by the mother seed, is pushing roots here and there in search of food in the soil. Just here might be remarked the necessity of furnishing this needed food, of an exactly right and of the most available kind just at this important moment. As the plant grows, the well-known process of "tillering" is accomplished by the throwing out of offsets from the main root as shown at Fig. 2. Each of these offsets soon becomes an independent plant, which throws out a set of roots for itself, and which may be separated and transplanted if desired. This new plant also pushes out independent offsets of its own accord, and *if the growth is vigorous and there is room enough*, these offsets again push roots and other offsets, and so the plant increases very rapidly until the ground is fully occupied. But it is now that we should prepare to meet

THE DANGERS THAT MENACE THE WHEAT PLANT.

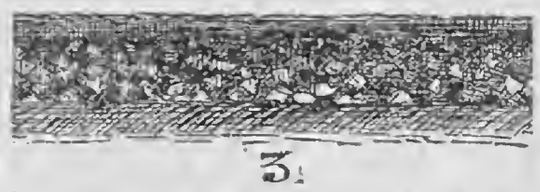
The first and most frequent danger is the improper condition of the soil. If the soil is not



2.

VIGOROUS WHEAT PLANT LATE IN THE FALL.

in such a condition that the roots can grow and spread safely, the plant is weak from the beginning. For instance, a soil that has been plowed at this season cannot help but be cloddy and uneven in texture. If the soil is then but lightly harrowed, the seed sown and harrowed in and the surface then rolled as a finishing operation, the seed has a hard time of it. The young rootlets need to be furnished with a fine mellow bed in which to grow; if there are clods and air spaces in their way, they cannot penetrate the one and they dry up in the other. A soil prepared as above mentioned, will be in the



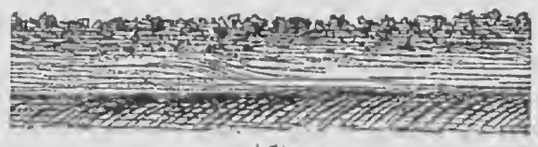
3.

A PLOWED SOIL ROLLED, BUT IMPERFECTLY HARROWED.

condition shown at Fig. 3. The surface will be fine and hard packed, but below this there will be a mass of lumps separated by interstices. The seeds deposited in these will either remain dormant or they will sprout to find impenetrable clods just above them, opposed to the passage of the spires; or the tender rootlets will perish by exposure to air in the open spaces and many plants will be abortive. Those which survive will be met by a hard, beaten, baked, surface impenetrable to air and to moisture; through which they will emerge with difficulty, weakened and injured. This condition of the young growth is more frequent than is suspected.

If, however, the soil had been rolled and then thoroughly harrowed, the mellow soil would have been worked down through the clods, and have filled the spaces between them, while the hardest and the largest of these would have been brought to the surface. The soil would then appear as at fig. 4, furnishing a perfect seed-bed and an open, loose soil, through which air and moisture, with consequent warmth, could penetrate in all directions.

It is useless to spend time in discussing the need for proper and sufficient supplies of plant-food. "That goes without saying." The wheat plant cannot feed upon raw, undecomposed food. It must be fit for immediate digestion and assimilation; and there is no other that can surpass in value thoroughly well decomposed stable manure, aided by a liberal addition of fertilizer,



4.

A WELL-HARROWED SOIL.

containing potash, nitrogen and phosphoric acid. Lime, in many soils, will be very acceptable. Our worst of all insect pests may be circumvented by giving vigor to the growth and enabling the plant to throw out new offsets for those injured or destroyed by the new industrious and frequent Hessian fly.

THE EFFECTS OF SURFACE WATER

seriously endanger the best sown crops. When frosts arrive, the surface soil is at first lifted from that below it by the expansion of the water contained in it; and as the cold penetrates

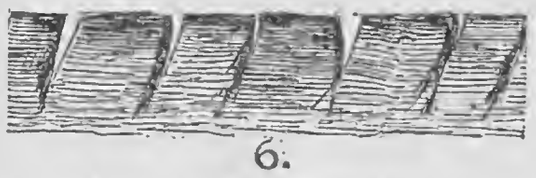
5.

SURFACE HEAVED BY A LIGHT FROST.

deeper, the soil is cracked perpendicularly into innumerable fissures. A surface frost acts as is seen at fig. 5; a deep frost acts as shown at fig. 6. Think for a moment of the effect of such a disturbance of the soil upon the roots as shown at fig. 2. In the first case, the plant is either torn bodily from its roots, or the roots are drawn out of the under-soil just so much as the crown of the plant is lifted. *These roots can never return to their place again.* The consequence is, a few such light frosts draw the weak plants with shallow roots completely out of the soil, and leave them naked upon the cold ground to die; or they rupture the fibers and entirely separate the plants from their roots. But a strong plant with abundant roots will be able *to lift up the soil with its roots*, just as in weeding we frequently pull up the roots and ball of earth together when a weed is strong and vigorous; and it will then resist the frosts successfully. When severe frosts occur, the weak plant succumbs in another way. The ground being fissured as shown at fig. 6, the root fibers must necessarily be ruptured, and the weak plant will be deprived of the most of its food gatherers. But the strong ones can stand this treatment even though they may suffer rupture of the roots. This rupturing process will tend only *to separate the individual offsets to make distinct plants of them.* Thus no harm will happen to the crop well sown, upon well-prepared fertile soil, excepting under very unusual circumstances, which would entirely destroy a weak crop.

BROADCAST AND DRILL SOWING

differ most in the depth to which the seed is deposited. This is a very material point, as may



6.

SURFACE SPLIT BY DEEP FROST.

be seen on reference to the annexed illustrations, figures 7, 8. At Fig. 7 is represented some seed sown broadcast; at Fig. 8 the drill-sown. Understanding the manner of growth of the wheat plant, and the effects of frost upon it, it is obvious and indisputable, that the broadcasted seed must suffer the most from the dangers incident to the winter season, and must be wasteful of seed, because some of it cannot grow in the best manner and must fail to thrive; at the same time many plants will be prevented from effecting their natural tendency to tiller and spread, because they have not room for it; while others will have more room than they can occupy.

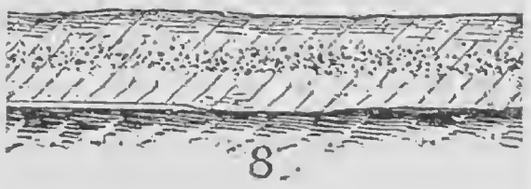
7.

BROADCAST SOWING.

However something of this matter must be left for the reader to deduce for himself, and this point may well be left.

METHODS OF DRAINING

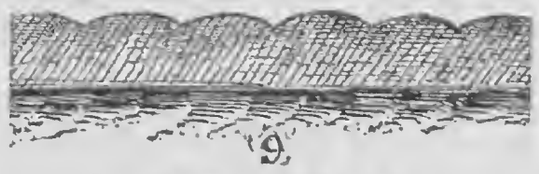
are very important. But where land is not already well drained naturally, or by means of tiles, it is useless to refer to the escape by these means from dangers which menace the wheat crop. A substitute for thorough drainage may however be found. This is by plowing the land



8.

DRILL-SOWING.

in ridges. It is an old fashion, but a good one; and if rightly done, may not interfere with the after use of the reaper or the mower. The appearance of a ridged field is shown at Fig. 9 These ridges may be made 11 to 22 paces wide, or of such widths as may be found desirable for the character of the soil. A wet, heavy clay would require narrow ridges, and a better soil those of the full width. The ridges are made by throwing deep back furrows where the centers will come, and plowing lands of the width required, with each successive furrow rather shallower than the last one, so as to give a slightly rounded form to the land. When the



9.

RIDGES FOR SURFACE-DRAINING.

field has been sown and finished, the open furrows between the ridges should be cleared out neatly, with a round-pointed shovel, if need be, both to make a smooth channel for the water and an even slope from the ridge to the bottom of the hollow. For an 11-pace ridge the rise of the crown need not be more than six inches; and nine inches will be sufficient rise for a 22-pace furrow. It will be obvious to thoughtful persons, but others may need to be told, that the ridges should be made to run with the slope of the field, so that the water may run off through the open furrows. If the field has considerable inclination the ridges should not be made directly up and down the slopes, but diagonally across them, so as to give the least inclination to the furrows possible with effective surface drainage. This will prevent a too rapid flow and washing of the soil. It is some extra trouble to plow a field in this manner when the surface is uneven, but it will pay well, if only the good, workmanlike appearance of a field thus plowed is considered. To have the work well done, makes it look well, and there is the advantage of making the work the most effective.

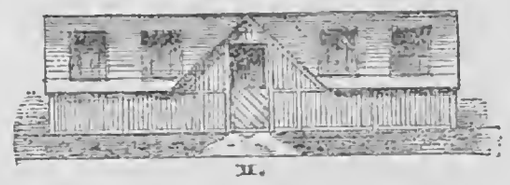
The Poultry Yard.

POULTRY BREEDING—No. 3.

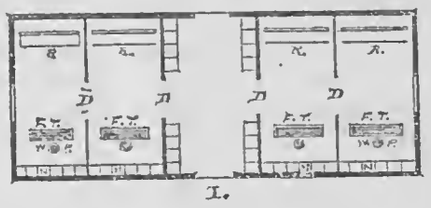
A. M. VAN AUKEN.

POULTRY HOUSES.

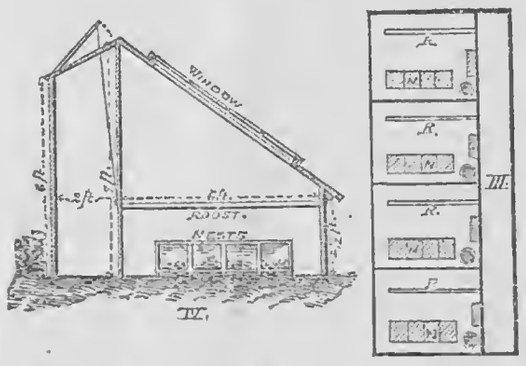
WE must have a house, in fact seven houses, in which to house our flocks, and as we are breeding for fowls and eggs for market, we can



II.



I.



IV. III.

afford no ingenious ventilators, no patent feed-hoppers or hens' nests, but all must be cheap and plain, though our house must be warm, well lighted and well ventilated.

First, I will describe our house for layers, which must also be the sitters'. Figure 1, is the ground-plan; it contains four rooms for layers and an apartment for sitting hens. Roosts are at R; F, T, is the feeding trough; W, P, is a common wooden water pail which we find to be the best water vessel; D, D, are doors; and N, N, are nests.

The roosts are of 2 by 4 scantling set flat-wise, with the upper edges rounded a little. In front of the roosts is a board partition coming up as high as the roosts, so that, in our monthly house-cleaning, we can mix the dirt with the manure and leave it under the roosts till spring. I prefer the roosts to be two feet from the ground.

The nests are made so that the hen enters by a covered passage in the rear of the nests, thus making them dark, which gratifies the hen's love of secrecy, and prevents the others from going into the nests to scratch and learn to eat eggs. The partitions are made tight for three feet, and above that are of strips two inches apart. The nests for sitters will be described in the article on sitting hens.

Fig. 2, is the elevation as seen from the south, of the house. It is built by setting posts in the ground eight feet apart, cut off three feet high; put a 2 by 4 on the top, and mortice another one in near the bottom, the same as you would for a picket fence, and set a post on each side of each door, as high as the door top. Fit your rafters on at a pitch of ½, and board them with surfaced lumber, then cover with tarred roofing; cover the sides and ends in the same manner. There are four windows in the roof, each made hot-bed fashion, 3 by 5 feet, and in each outside door is a sash. A strip of felt forms the gutter where the two roofs meet. The fence runs up over the roof, and lengthwise on the peak nail on pickets about three feet high. In the summer the doors are taken off and wire net doors take their places.

The breeders' house, is quickly described: the lenght is 20 feet and the width eight feet; it is divided into four apartments each 5 by 6 feet. The partitions are made of strips of 1 by 1½ inch pine, nailed two inches apart. The outside is of inch pine boards planed and battened, and the roof is of common matched flooring, and in each apartment is a 3 by 5 hot-bed sash in the roof. Ventilation is provided for by raising trap-doors in the short pitch of the roof. The fowls that go in the yards north of the house, pass through a movable box across the passage. No rafters are used in the building. In the plan, fig. 3, the nests are at N, and at R, are the roosts; the circle is a water pail, and by it is a feed-box, so that these may be filled from the passage.

The other house is just like this but it is only half the size.

Pomological.

RIPENING AND MARKETING PEARS.

W. H. WHITE.

MOST SALABLE SORTS.

To ripen and market any product, especially pears, presupposes that we first produce such fruit in quality and quantity as to be worthy of such disposition. There is very little encouragement for the horticulturist, or for any one else, to produce and place on the market anything except a fairly good article—the greatest profit arises from superior products, well matured, and placed in market in an attractive form. Two or more specimens may be in most respects well grown or matured, and still be very unlike; and when offered as show samples, or for sale, the one will have precedence over the other in the eyes of the general public. A large or finely formed well-grown pear, unless properly ripened, will possess but little attraction either to the eye or taste; whereas, if the same be properly ripened, both these senses are gratified. Some varieties possess natural attractiveness to a greater degree than others, even when equally well matured and ripened, and such will frequently be preferred by the superficial observer and consumer, but the educated and experienced taste will sometimes see excellence underneath a somewhat unattractive exterior, and select accordingly. But in catering for the general public we can hardly be expected to educate and radically transform their taste at once, but we must take it as we find it and raise the standard gradually; therefore I say, that which possesses greatest attraction to the eye will generally be the thing sought; and this is true with regard to fruit as well as other things.

WHEN AND HOW TO GATHER.

Pears should not be allowed to ripen, but only to mature their growth on the tree, from which they must be picked at the proper stage—if we can determine that exact stage—and be ripened artificially. The exact time to gather the different varieties must be learned by observation and experience. Fruit of the same variety on the same tree matures at different dates and should not be all gathered at the same picking, but at different times as it becomes mature and is developed. Some varieties require to be taken from the tree at an earlier stage than others. A rule given and acted upon by many experienced horticulturists, is to "pick when the stem of the fruit will part from the spur without breaking." Either when the seeds have changed from a white to a brown color, or when the sugar begins to form, would be the most exact; and this time varies in different seasons, soils, condition of the trees, etc. etc. Pears always look better and sell more readily and for better prices when gathered with the stem entire, and for the same reason care should be taken that they are not bruised or otherwise disfigured. Therefore, when gathering or in any way handling them, this fact should be constantly kept in mind and acted upon. In gathering, carefully place the fruit, by hand, in suitable baskets—any bruise soon begins to decay, and will always show and detract from the value of the fruit.

STORING.

It is always best to assort the fruit at the time of gathering, especially if to be sold—large, medium, and small-sized should be placed in separate parcels and immediately removed to the place where they are to be kept, which may be any suitable dry room or place where light and air may be excluded from the fruit, and the temperature be kept at nearly an even standard. It sometimes occurs that there is in the market a kind of "glut" of certain varieties, and if they were held back a few days it would greatly relieve the market and enhance prices to the benefit of producers. As it is to the interest of these to arrange and create a continuous market, at remunerative rates, they should at such times place their pears in detention rooms where an even and low temperature may be maintained. Rooms suitable for this purpose may be arranged in connection with an ice house, say at one side or over it. The room should be double-walled—sides, doors, windows and roof—with air chambers between, all made tight.

ARTIFICIAL RIPENING.

All pears are superior when ripened at the particular date when they would naturally come to perfection, and in nature they do not retain this superiority long after such date; but by artificial means they may have that date delayed somewhat or hastened, yet they are somewhat less choice when these means are necessarily resorted to, especially if the difference in time is considerable. As a low temperature retards ripening, so also an increased temperature hastens or will cause premature ripening, so that fruit placed in the retarding room may be held till such time as better prices may be realized, while when fruit is to be disposed of as soon as ripe, it may be placed at once in a fruit-room where an even warm temperature is maintained, the warmer, of course, within reason, the sooner the ripening process is gone through. In all cases the fruit, while ripening, should be excluded from light and air, and the same precaution should be observed while it is held in the detention-room, as it is upon this measure that the color, firmness and, in part, the flavor depend. Frequent examinations of the ripening fruit, and the removal of the ripe ones, are also requisite. When it is necessary or desirable to ripen pears in perfection immediately after gathering, I find no better way than to place them in shallow boxes, drawers, or baskets in the fruit-room, excluding light and air from the fruit, and where a temperature of 50° to 60° may be maintained. This treatment brings out color and flavor. With care in gathering, handling, etc., I find that such management is all that is necessary in ripening summer and autumn varieties.

TREATMENT OF WINTER VARIETIES.

Winter varieties demand special treatment. They require to be left on the trees as long as the leaves remain green and healthy, or as long as they are safe from frosts. Different cultivators pursue different methods of treatment subsequent to gathering. Some pack them in close packages, as barrels, boxes, etc., and place these in some cool and dry place, such as the north side of a building or wall, etc., covering them with loose boards or the like, to shed rain. Here they remain till hard frosts come, when they are removed to some building, such as a barn, where they remain until it is decidedly cold, some straw or hay being thrown over the packages. Pears will bear 15° of frost without injury if kept in close packages, and if light and air are excluded and they remain undisturbed. Others place them in the cellar a day or two after being picked, while others, again, follow some course slightly different. I consider as good a plan as any is to assort them as gathered, place them in barrels or boxes, put these in the coolest and driest part of the barn, and there let them remain till the market is ready to receive them, or as long as it is safe to risk frosts, and I wish to remove them to the cellar. I do not like to have them become frosty, and so place them in a cool, dry cellar. If such a cellar is not available, a room can be made above ground to exclude hard freezing; in such storage allow them to remain till they may be required for ripening or other purposes. Various contrivances, patented and otherwise, for fruit preserving, are now employed in different localities and by different individuals; but in our New England climate I think there will be little or no difficulty in keeping pears as here described. The main requisites seem to be, to have sound, well-matured fruit and then to keep it cool and dry, away from light and a free circulation of air. Well grown and mature winter pears, as a general thing, will ripen perfectly in the cellar where the temperature ranges from 38° to 40°. If desirable to ripen them sooner, they can be brought into a warmer room where the temperature ranges higher but is still nearly uniform: here they will finish the ripening process finely.

PACKING.

As a rule, dealers understand the ripening of pears and prefer to have them before ripe. The better way, then, is to properly assort and send them to market in half-barrels, as the half-barrel package is generally preferred by dealers and others; such packages also sell more readily at better prices than those that are larger, while the freight on them is less than on boxes and crates. Should they be ripe, however, or nearly so, they will bear transportation better in small boxes or crates. Appearance goes a long way in our every-day life, so attractive packages aid largely in selling in market. New, clean barrels, boxes or crates, as the case may be, should be used for packing and sending them to market in. So put up, they will find a much readier sale at much better prices than when old or soiled packages are used.

Assort your pears carefully, putting fruit of only one variety and even quality in the same package, and have them even throughout. Establish a reputation so that your brand shall be a guarantee of excellence and command confidence. When the fruit arrives at the proper stage for packing and shipping, take a suitable barrel; knock off the hoops and remove the bottom; line it throughout with unsized white paper, as it will give the whole a much better appearance; pack your pears—one at a time—as close as they will lie on their sides, layer by layer on the head, till the barrel is one-third full; then gently shake it to settle the fruit closer. Continue packing as before, shaking three or four times till the package is full, so that when the bottom is pressed in it may come in close contact with the last layer; cover with the paper, place and press in the bottom, and drive the hoops on; then drive in three or four nails so as to hold the hoops and bottom in place.

MARKETING.

The package should then be marked 1, 2 or 3, according as the quality may be, so that your consignee may know without opening what the quality is. Always advise your consignee by letter of the number and quality, etc. of fruit packages. If the fruit is choice, half-barrels are decidedly preferable for packages. If one lives near market, and so desires, he can ripen his fruit and take it to market himself in baskets, which should always be lined with white paper to give their contents an attractively inviting appearance. I would advise lining all packages, whatever their shape may be, with white paper; and this should be done, whatever the quality of fruit sent to market. Make *all* the fruit in the same package *alike throughout, no facing* or the like whatever; and always mark the packages with your initials or brand, as well as with a figure denoting the quality of the fruit they contain. They should also have on them the name and address of the consignee in plain letters. Minor details, when attended to, often make the difference between a profit and a loss.

Worcester Co., Mass.

THE ORANGE IN CALIFORNIA.

WM. C. L. DREW.

VARIETIES.

The cultivation of the orange in California has deservedly attracted much attention, not only as a source of profit, but as an adjunct to the beauty of the home surroundings, the farm and the vineyard.

There is nothing that excites the attention of the cultivated and refined like an orange grove, whether in fruit or in blossoms, feasting the eye with its beautiful contrast of bright evergreen foliage and snow-white blossoms or golden fruit.

This article is not written to give the *modus operandi* of cultivating the orange, but to give a short description of the several varieties. I will first introduce the most numerous class.

SWEET ORANGE, CITRUS AURANTIUM.

This class is composed of numerous varieties, from which I shall select a few of the most distinct types. Just as in other fruits, I am of the opinion that many of the so-called varieties are not entirely distinct. All practical cultivators know that a fruit of any variety, under favorable conditions, will become more highly developed or perfected, both as regards size and flavor, and as there is no fruit more affected by local circumstances than the orange, which is affected not only by soil and situation, but also by age, it is presumable that the characteristic qualities of many of the so-called varieties are the results of some local circumstance and not the result of hybridization, by which new strains or varieties are originated. It is for this reason I shall confine myself to distinct typical varieties.

St. Michael Orange.—This is an excellent and favorite variety, being in great repute among orange growers. Where grown under favorable circumstances, it is sweet and delicious; but in uncongenial localities, it becomes deteriorated and inferior. The fruit of good size has a very thin skin, smooth and brilliant in color. Where grown in favorable situations it is very prolific, incredible numbers of good oranges having been gathered from one tree in a single season. It is not as hardy as many other varieties and requires some protection even in our most favorable sections.

The Naval Orange.—This is a popular variety. It bears fine, large fruit, is frequently seedless. It is also propagated under the name Bahia, but can always be distinguished by a naval-like scar when the blossom drops off. In flavor it has no superior. It is not a prolific bearer, but always produces fine fruit. It is rather tender and requires to be planted in a well-sheltered situation.

Siletta Orange.—This is a general favorite, and one that should be well represented in every orange grove. It is known by two other cognomens, viz:—"Cluster" and "Prolific" orange—the former name indicates the manner in which the fruit is produced in bunches or clusters, the latter is derived from the prolific manner in which it bears. It is one of the hardiest varieties grown on this coast. The fruit is of good size, superior quality and flavor, and very bright in color. On account of its fruitfulness it is a profitable sort.

Mandarin Orange.—The Dwarf Chinese or Mandarin Orange is cultivated both for ornament and fruit. It is a distinct species including several varieties. The trees are of dwarf growth, compact in habit, hardier than any other strain, bear very freely and while small. The fruit is of small size, flattened at both ends, and in flavor it is quite distinct from all other varieties. Trees of this kind, independent of their value for fruit, are very desirable for embellishing front yards and ornamental grounds, or for planting in shrubberies where they are highly effective.

Coolie Orange.—This variety is a close relation to the last mentioned. It forms a beautiful, symmetrical tree, with a fine, round head. Fruit small, similar to the last, but with a somewhat thicker skin, flavor excellent. When in full bloom, the tree presents an imposing appearance.

Paramata Orange.—This is one of the commonest varieties, being grown very extensively in all orange-growing sections of the world. It is very hardy, bears abundantly, and the fruit is of medium size and well-flavored.

Konah Orange.—This is a comparatively new introduction. The tree is an exceedingly vigorous grower, fruiting early and bearing regularly and heavily. The fruit is of good size, of an exceedingly fine flavor and of a handsome color

Acapulco Orange.—This is a standard variety, having no rival. The tree is a strong, vigorous grower, hardy and a good bearer. The fruit is of large size, very symmetrical and beautiful in form and color, and of an excellent flavor.

Maltese Orange.—The Maltese or blood orange, so named from the color of its flesh, is only worth growing for sake of variety. The flesh is blotched with red stains. It is an abundant bearer and very hardy.

Bouquet Orange.—This is a variety grown principally for its blossoms, for which it is highly esteemed. The fruit is worthless: it is hardy and of a symmetrical growth. It produces abundance of very fragrant blossoms.

Pumalo Orange.—This is grown only as an ornament. Fruit very large, showy, pear-shaped, but inferior. An exceedingly handsome tree when in fruit.

BITTER ORANGES

are now considered as quite distinct from the sweet. Of the Bitter orange—Citrus vulgaris—there is only one variety generally cultivated, namely the

Seville Orange.—The fruit of this variety is principally used as a conserve, being too bitter to make a palatable desert. Large quantities of it are used in making the candied peel of commerce and in making marmalade. It is grown principally, however, for the blossoms, which are used in making perfumery: The orange water of the perfumers is almost entirely the product of the flowers of this strain. It must not be supposed that the sweet orange blooms are not used, but they yield the essential oils in much less quantity than those of the bitter.

In the foregoing list I have neglected to mention the Mediterranean Sweet, the Los Angeles, the Mission, the Exquisite, and many other varieties in cultivation in the orange groves of California.

El Doraldo, Cal.

Arboricultural.

EVERY-DAY NOTES.

SAMUEL PARSONS.

A PLEA FOR ALTHÆAS.

More properly called Hibiscus in botanical phrase, these old-fashioned shrubs also delight in the lovely and ancient name of Rose of Sharon. Time out of mind Althæa hedges have surrounded gardens and lawns. Their characteristics have consequently become so familiar as to possibly detract from their real value in our eyes. Is it this, or something fairly attributable to the plant. True, the flowers are wanting somewhat in delicacy, but their tints are rich and varied in the most attractive manner. If there is a certain downright appearance of the stem, a little general coarseness not exactly suggestive of grace, the foliage has, on the other hand, a fine, bright hue and curious outlines. Sometimes, moreover, the leaves are so strikingly variegated with white as to draw forth expressions of delight from experienced horticulturists, who have just left much rarer plants with but passing notice. Perhaps, such a peculiar combination of qualities makes a really fine appearance suggest something odd and not quite graceful. Be that as it may, the Althæa is a most valuble shrub, especially in August when flowers are scarce. A vigorous habit also enables it to produce strong, compact hedges, useful as well as ornamental. Its individuality is certainly marked, so much so as to prevent a harmonious combination of its color and form in groups of other shrubs. I have always, therefore, preferred to see the Althæa standing singly or massed with its own kind.

THE WEEPING OAK.—QUERCUS PEDUNCULATA PENDULA.

This oak is well-known for its fine weeping nature, glossy foliage, and other choice qualities peculiar to the genus. It is by no means common, however, requiring a skilled grafter to perpetuate its beauty. I have long known and recognized its exceeding beauty and grace, but to-day one of its traits has been impressed upon me as never before, viz: Vigor of growth. The Oaks as a genus are not celebrated for rapid growth. They are sturdy, rugged, and attain, in time, massive size; but, as a rule, they grow slowly while young. Indeed, a purple oak—which, by the way, is also a variety of *pedunculata*—has been known to take ten years to grow less than two feet. To-day, however, I have seen a Weeping Oak, grafted during the spring of 1878, that had up to the present date in August, made a new growth of five feet, and that, too, on light, gravelly soil where other trees have thriven but poorly. The Pyramidal Oak can alone in this genus, as far as known, offer any parallel to this.

THE JAPAN DOGWOOD.—CORNUS BRACHYBOTRIA.

The variegated form of this Dogwood was first recognized and valued in America for the the remarkable permanence of its white shading, which, on other kinds of trees, fares so badly under our summer suns. Latterly, however, the parent stock, C. Brachybotria, has been imported for the purpose of propagating the variegated kinds by grafting. The habit of this shrub has proved vigorous and hardy, and remarkable for the broad layer-like masses of rich leaves, which grow very much after the manner of the American Dogwood, C. florida. Jus

now, in mid-August, the foliage of the Japan Dogwood is specially notable for its fine shading of purple on the decaying leaf. The whole firm, glossy surface is either suffused or mottled with purplish hues in a very effective manner.

RUSTY APPEARANCE OF HORSE-CHESTNUTS.

The Horse-chestnut is a tree that often fails to retain its beauty of foliage even in August. In June, arrayed in bright green, with the softest and roundest outlines, and studded with clusters of red or white flowers, nothing can be more beautiful in its way. But the beauty passes too soon. It is for this reason that we would give the palm to the Norway Maple as a shade or lawn tree, although in June it would be very difficult to choose between them.

THE DWARF CATALPA.

This has been termed, botanically, Catalpa Kæmpferi, and although comparatively well-known, fails of the reputation it deserves. For soft, rounded outlines and delicate shading, during late summer and fall, on a remarkable foliage, it deserves special mention. Lawn planters should employ it largely to accomplish effects produced by round-headed plants, for which purpose, among shrubs, it is quite as valuable as the Horse-chestnut is among trees.

Flushing, L. I

Floricultural.

NOTES FROM THE RURAL GROUNDS.

HIBISCUS MOSCHEUTOS

Though everybody admires flowers, it must be supposed the great majority of people know little or nothing about them. The above flower is now in bloom, and we hear passengers in the rail-road cars, struck by their extraordinary showiness, ask what they are and if they could be cultivated in gardens, and we have been asked such questions a dozen times or more within the past week during our time-wasting journeys to and from the Rural office. The meadows through which we pass, are now beautiful gardens of wild flowers, most brilliant and striking among which is the Swamp Rose-Mallow. Here and in similar places along the coast they have bloomed for many years no doubt—their brilliancy always admired and year after year provoking the same earnest questions. But the curiosity thus excited must die out with the flowers, for we have never seen them in any garden besides this, and know of few instances of their cultivation ever being attempted. The flowers vary from white to a bright purple rose—some with, others without a dark eye, and some with a pure white eye. We have just spread out and measured a flower that is exactly nine inches in diameter!

Some authorities have it that these plants do better in swampy land than in dry situations. But we have them in both raised from seeds, and and those in the high situation are the finest. They are more dwarf and compact, the flowers are larger and the leaves more enduring.

The leaves and stems are annual and the roots perennial. They are easily raised from the roots or from seed. In the meadows the flowers vary from a deep rose to white, as we have said. But under cultivation very likely their variation would prove greater. It is our intention to send and gather a quantity of the seeds this fall, in which case those of our friends who so desire can raise seedlings of their own.

PELARGONIUM "WONDERFUL" AND ABUTILON DARWINII.

Mr. John Saul, of Washington, D. C., sent us this spring a large variety of new or rare plants. It was our misfortune to lose many of them by the hard, late frost, about which so much was said in the Rural New-Yorker at the time. Among the survivors, however, is Abutilon Darwinii, a distinct and attractive plant with large, reddish flowers, similar to those of A. Boule de Neige in shape, though larger. The popularity of Boule de Neige seems to have awakened florists to an appreciation of Abutilons in general—an appreciation that is surely well-deserved. Easy to cultivate, very gay in their profusion of blossoms, adapted alike for the flower-bed, conservatory or window, their free beauty is secured with little trouble. Among Mr. Saul's plants was the Pelargonium "Wonderful," sent to us also by Mr. Henry Hales. It has been advertised extensively in England as one of the most profuse-flowering Pelargoniums known. And we have found it so to be. The flowers are double—the habit dwarf. Very small plants send up numbers of flowering stalks, and before these have ceased blooming, others are ready to take their places, until it would seem that the little plants would bloom themselves to death.

Dairy Husbandry.

DAIRYING AND SOIL IMPROVEMENT.

E. W. STEWART.

MILK AND CHEESE PRODUCTION.

I have had occasion to point out how dairying may deplete the soil on which the cows are fed, that milk is rich in nitrogen and mineral constituents. A cow that gives the moderate quantity of 4,000 lbs. of milk per year, would abstract from the soil, in her milk alone, 26 lbs. of ash and 24 lbs. of pure nitrogen in the 160 lbs. of caseine. If the milk were sold this would all be lost to the soil; or, if made into cheese, the mineral constituents, as well as nitrogen, will be mostly carried off in the cheese. The depletion is much greater in feeding milch cows than in fattening steers or cattle. If we are to suppose the steer to gain an average of 300 or 400 lbs. live weight per year, and then compare this with the moderate average we have supposed the cow to produce in milk, we find the steer only involves a loss of three to four lbs. of mineral constituents and about three lbs. of nitrogen. It will thus be seen that if the milk be sold, it will involve many times as much loss to the soil as in growth of the fattening steer. Whatever the steer eats more than sufficient to supply the elements of his growth, goes back to the soil in the manure. This explains the foundation for the opinion, quite prevalent, that dairying is more exhausting to the soil than beef raising.

But all dairying is not thus exhausting to the soil. Commercially the most valuable element of the milk is the cream. When cream is the only element of the milk sold, and all the rest is fed to pigs or calves on the farm, it takes little or nothing of value in the butter, for that contains no mineral matter, no nitrogen—it is merely carbon and water, which may be replaced from the atmosphere.

BUTTER DAIRYING.

This is not exhausting to the soil, as the mineral matter is all contained in the skimmed milk as well as the nitrogen. Butter has been the principal manufactured product of the dairy in the United States, as there are only 300,000,000 pounds of cheese to 700,000,000 pounds of butter made. The American people are said to be the greatest butter eaters in the world, and the home market is immense. There can be no doubt that the export butter-maker receives the best remuneration for his labor and capital; and, since this branch of dairying also keeps up the fertility of his soil, there is much to recommend it. The best article brings double the price of the common article and really costs no more, and probably less, than the poor article. For the dairyman, who has studied the business enough to know how to make the best quality of butter, has also studied the selection and feeding of cows, so as to produce the best yield of milk. And he thus produces more butter from the same food, and consequently produces butter at less cost per pound, besides its quality rendering it doubly valuable in market. The skimmed milk, being fed to pigs and calves, makes rich manure which goes back to the soil, and what is lost is only that which is assimilated into the body of the young animal. Let us see, on scientific principles, what fertility is lost in feeding refuse milk to pigs and calves.

REFUSE MILK FOR CALVES AND SWINE.

If we take a pig six weeks old, that weighs 20 lbs., and feed that pig skim milk for 200 days and increase his weight 200 lbs. it will require, on the average of pigs, 3,000 lbs. of milk to make this growth, or 15 lbs. to the pound of growth. The 3,000 lbs. of refuse milk will contain about 22 lbs. of ash constituents, and the 200 lbs. growth on the pig will contain only two lbs. of mineral matter, the milk will contain 18 lbs. nitrogen, and the 200 lbs. growth of pig, less than two lbs. of nitrogen, so that the loss in fertility from feeding the skim milk to the pig will be very little, provided the manure is all saved and applied. The result will be about the same on the calf, but requiring more milk to make a pound growth. We do not estimate the fat formed in the pig, because this contains no mineral constituents and no nitrogen. It is easy to keep up the fertility of the soil in butter dairying.

Miscellaneous

MIXED FARMING.

I am an advocate of mixed farming. I believe it better for a farmer to depend on several crops for his money than on one alone; for, how often does some particular crop become a complete failure? Then where are the funds coming from to meet store bills, pay taxes, the minister and printer? Some years there is so much of one product raised that it is very low, and if you happen to depend wholly on that crop, where are you then?

Now if you practice mixed husbandry it is entirely different; for you are almost certain of some crop selling for a good price; hence, you can be on a surer footing than if you raised simply one kind of crop, especially if your capital is limited; for then you cannot afford to wait until another crop can grow: accordingly I believe it always the surest and best plan, for the young farmer especially, to grow a variety of crops. The most independent farmer is the one who has more than one crop to depend on. The farm is a place where all the different varieties of food can be raised, and it seems to me the object of the farmer should be to grow all, or nearly all of such kinds of food as he will need to consume in his family and feed to his stock; or, in other words, let nothing be bought that can be grown on the farm at a fair cost.

If we can raise wheat at 80 cents per bushel, can we afford to buy it at $1.25? or, if we can raise our pork at $5 per hundred, can we afford to buy it at eight cents a pound? Let a farmer who has practiced mixed husbandry for a term of years, turn his attention to, and labor wholly upon one crop, and if he does not deny himself some of his customary luxuries I shall be very much mistaken. F. H. D.

Meadowbrook Farm.

WHAT OTHERS SAY.

American Pork.—The London Farmer says, on the authority of the Deutche Fleischer-Zeitung, that two butchers, in a large way of business at Cologne, have come to America with the intention of buying up here and taking over for home consumption a cargo of two thousand pigs. Their calculations are said to be based on the assumption that the current price on large transactions ranges from 3 to 3½ cents per lb. live-weight, at which figure there is room for a handsome margin of profit, after making liberal allowance for all the heavy expenses and risks beyond the mere purchase of the "raw material." Our contemporary is, however, inclined to doubt the wisdom of the speculation, owing to the apparent omission of one important element in the enterprising butchers calculations. It is now an established fact that American pork is far less free from trichinæ than the flesh of native pigs; popular prejudice runs high against it, and the official inspections of the meat are now so rigorously and systematically carried out that there is very little chance of any of it finding its way into consumption if not altogether above suspicion, as has previously happened with consignments from America on more than one occasion.

Much or Little Manure?—Mr. W. J. Fowler, in the Country Gentleman, speaks of the common theory with writers on agriculture, viz., that if soil is made very rich there is a constant tendency to loss of fertility by leaching or evaporation. On heavy soils with retentive subsoil, he has never experienced any serious difficulty from this cause. His observation and experience show that thoroughly enriching the soil is not only profitable, but the most permanent improvement that can be made. "Apply little manure and often," is the advice usually given. Rather manure thoroughly as fast as you can is his advice. As for the permanence of heavy manuring, Mr. Fowler instances a knoll in one of his lots where forty or fifty years ago stood a house and barn. That knoll has been cropped without manure thirty years or more, and still that old barn-yard is the richest part of the field, though other portions have been manured on the "little and often" theory at least five or six times. It is a question in his mind whether it would not have paid better to apply these several small dressings in one—make it as rich as the knoll and then leave it without further manuring, except clover, till the soil needed it.

Shingles and Shingling.—Cheap spruce shingles, says Col. Curtis in the Weekly Tribune, are not worth the cost and trouble of putting down. The best of sawed pine shingles may be had now for $4 per thousand. He had a man shingle a large barn once who insisted one nail was enough for a narrow shingle, and after a few years every high wind would blow them all over the farm. A leaky roof soon followed, and a new one. Two nails should be put into every shingle, and wide ones ought to have three or more. They ought not to be driven near the edge, and if the shingle is very narrow, the nails should not be put opposite each other, for a nail near the edge of a shingle will rust out and the shingle will get loose. A roof well laid will last many years longer than one put on in a hurry and by cheap and careless help.

Rothamsted.—Mr. Lawes' experiments, says a writer in the London Chamber of Agriculture, are now directed to ascertaining the grounds for the belief that the conversion of ammonia, when introduced into the soil, into nitric acid after a fall of rain is due to some living and obscure organism. But be this as it may, his remarks on the unceasing motion and circulation of ammonia in different forms through the earth and air, are very striking; while nowhere better than from the Rothamsted experiments can the farmer learn the fugitive, flighty character of this indispensable agent in its passage through the earth, and the "catch-you-when-I-can" efforts of the roots of plants to absorb it ere it passes out of their reach.

Clover.—In "The Grasses of Tenessee," a book to which we have lately referred, Mr. Killebrew says: "Upon whatever farm clover is grown in regular rotation, there will be found abundant crops, fat stock and improved husbandry." He deems it the main pillar of Tennesee agriculture, and says that it is worse than folly to attempt to make farming pay for any number of years without it. "A farmer who is too poor to sow clover seed is too poor to own a farm, and however great may be his exertions (unless within reach of large towns where manures are abundant), if he does not sow clover, he is doomed to a hopeless poverty."

Polluted Water.—An extraordinary fatality from diptheria, etc., in one house and family at Finchely, is recorded by Dr. Saunders in a report recently presented to the Barnet Rural Sanitary Authority. The water used for drinking purposes was from a shallow well, and was polluted. Dr. Saunders mentions the case particularly, because he thinks it very desirable to break down the tradition that familiar odors, such as farm-yards and certain offensive trades, are harmless. The cases of diptheria which have happened through his entire district have every one been under the influence of impure air, although from sources not unusual, and, therefore, thought little of.

The Season.—It is well understood, says the Mass. Ploughman, that in our fickle climate, subject to frequent and severe droughts, crops of all kinds are subject to considerable risk from want of water; it is also well known that the best results obtained by the use of chemical fertilizers have been in moist seasons. Is it not, therefore more than probable that the reason for the common and general preference for yard manure wherever it can be had, is due to its capacity to hold water through a severe drought and yield it to the growing crops in time of need?

The London Gardener's Chronicle speaks of another Eucalyptus—E. citriodora: "Lovers of interesting rather than 'strikingly showy' greenhouse plants should make the acquaintance of the new lemon-scented Gum tree, Eucalyptus citriodora. It is a slender-habited plant, with oblong leaves, covered with glandular hairs, which when gently rubbed, emit a powerful odor, resembling that of the lemon-scented Aloysia. A native of Australia."

Something for Nothing.—Labor and material cost money, and they must be paid for, or somebody must be wronged. It makes no difference whether the business is selling groceries, or publishing newspapers, or anything else, if anybody attempts to give something for nothing, or to get something for nothing, he or somebody else will get his fingers burned sooner or later.—*Western Rural.*

Clearing Rust from Steel.—As difficulty is frequently experienced in removing rust from steel, we (Dublin Farmers' Gazette) submit the following mode as one of the best and simplest for brightening rusted surfaces:—cover the metal with sweet oil, to be well rubbed in, and in forty-eight hours afterwards rub with finely pulverized unslacked lime.

The Poultry Bulletin says that air-slaked lime, such as used for agricultural purposes, should be put where the laying hens can get at it at will, for they need it constantly in the process of egg manufacture.

CATALOGUES, &c., RECEIVED.

We beg to say that owing to the space given to Crop reports, we are obliged to slight our acknowledgments of Catalogues, etc., received, which have accumulated in the meantime.

The Summer meeting of the National Agricultural Congress occurs at New Haven, Conn., on August 27 to 29, its object being the discussion of papers and addresses relating to agriculture and agricultural economy. The programme will be arranged from day to day. The following gentlemen have accepted appointments to address the Congress: J. R. Dodge, Prof. Eug. W. Hilgard, John L. Hayes, Dr. C. V. Riley, X. A. Willard, Dr. J. T. Tichenor, Prof. Wm. H. Brewer, Dr. E. Lewis Sturtevant, Prof. W. O. Atwater, B. G Northrop, J. J. Thomas, Horace J. Smith, Dr. N. H. Paren, Rev. Wm. F. Clark, Prof. S. W. Shattuck, Ernest Th. Gennert. The Governing Board of the Sheffield Scientific School, of Yale College, have kindly tendered North Sheffield Hall for the meeting of the Congress.

Hon. Thos. P. Janes, Pres., Atlanta, Ga.
Jonathan Perian, Sec'y, Chicago, Ill.

Premium List of the 28th Annual Fair of the Vermont State Agricultural Society and Wool Growers' Association, to be held at St. Albans, September 10-12. Henry Clark, Rutland, Sec'y.

Premium List of the Thirty-eighth Annual Fair and Cattle Show of the Fairfield Co. Agricultural Society, to be held at Norwalk, Conn., September 10-13. Wm. D. Gregory, Sec'y.

Broome Co. Agricultural Society. List of Premiums and Regulations for the Eighth Annual Fair, to be held at Whitney's Point, N. Y., September 3-6. Milo B. Eldridge, Sec'y.

We thank the Secretary of the State Agricultural Society, of Wisconsin, Mr. George E. Bryant, for a copy of its interesting transactions for '77-8. 500 pages.

We have to thank Gen. Albert J. Myer, chief signal officer, U. S. A., for his annual report to the Secretary of War for the year 1877.

The Querist.

ANSWERS TO CORRESPONDENTS.

To Transfer Bees.

ANSWER BY PROFESSOR A. J. COOK, OF MICHIGAN AGRICULTURAL COLLEGE.

Young Bee-keeper.—Having several colonies of bees which he wishes to transfer from old box hives to new ones with moveable frames, asks for advice as to the best manner of doing so.

ANS.—The best time to transfer is early in the season, when there is but little honey in the hives, though it may be done at any time, if sufficient caution is used; still it should never be done except on warm days, when the bees are actively engaged in storing. After the bees are busy at work, approach the old hive, blow a little smoke into the entrance to quiet the bees, then carry the hive off a few feet, and turn it bottom up. Place a box over the hive—it will make no difference whether it fits it close or not, if the bees are so smoked as to be thoroughly alarmed—and with a stick rap on the lower hive for about twenty minutes. The bees will fill with honey and go with the queen into the upper hive and cluster. If towards the last we carefully set the box off once or twice, and vigorously shake the hive, and then replace the box, we will hasten the emigration of the bees, and make it more complete. A few young bees will still remain in the old hive, but these will do no harm. Now put the box on the old stand, leaving the edge raised so that the bees which were out may enter, and so all the bees can get air. If other bees do not trouble, as they usually will not if busily gathering, we can proceed in the open air. If they do, we must go into some room. I have frequently transferred the comb in my kitchen, and often in a barn. Now, knock the old hive apart, cut the combs from the sides, and get the combs out of the old hive with just as little breakage as possible. If transferring in spring, a good plan would be to saw the combs and cross-sticks loose from the sides, turn the hive into the natural position, then strike against the top of the hive with a hammer till the fastenings are broken loose, next lift the hive, and the combs are all free and in convenient shape for rapid work.

We now need a barrel, set on end, on which we place a board fifteen to twenty inches square, covered with several thicknesses of cloth. Some apiarists think the cloth useless, but it serves, I think, to prevent injury to comb, brood or honey. We now place a comb on this cloth, and a frame on the comb, and cut out the comb the size of the inside of the frame, taking pains to save all the brood. Now crowd the frame over the comb so that the latter will be in the same position that it was when in the old hive; that is, so the honey will be above—the position is not very important—then fasten the comb in the frame, by winding about all one or two small wires or pieces of wrapping twine. To raise the frame and comb before fastening, raise the board beneath till the frame is vertical. Set this frame in the new hive, and proceed with the others in the same way till we have all the worker-comb—that with small cells—fastened in. To secure the pieces, which we shall find abundant at the end, take thin pieces of wood, one-half inch wide and a trifle longer than the frame is deep, place these in pairs either side the comb, extending up and down, and enough to hold the pieces secure till the bees shall fasten them, and secure the strips by winding with small wire, just above and below the frame, or else tack them to the frame with small tacks.

Having fastened all the worker-comb that we can into the frames—of course all the other, and all bright drone-comb, will be preserved for use as guide-comb—and placed the frames in the new hive—these should be put together if they contain brood, especially if the colony is not very strong, and the empty frames to one side—we then place our hive on the stand, pushing it forward so that the bees can enter anywhere along the alighting-board, and then shake all the bees from the box, and any young bees that may have clustered on any part of the old hive, or on the floor or ground, where we transferred the comb, immediately in front. They will enter at once and soon be at work, all the busier for having passed "from the old house into the new." In two or three days, remove the wires or strings and sticks, when we shall find the combs all fastened and smoothed off, and the bees as busily engaged as though their present home had always been the seat of their labors.

Of course, in transferring from one frame to another, the matter is much simplified. In this case, after thoroughly smoking the bees, we have but to lift the frames, and shake or brush the bees into the new hive. For a brush, a chicken or turkey wing, or a large wing or tail feather from a turkey, goose or peacock, serves admirably. Now, cut out the comb in the best form to accommodate the new frames, and fasten as already suggested. After the combs are all transferred, shake all remaining bees in front of the new hive, which has already been placed on the stand previously occupied by the old hive.

Sprain in the Coffin-joint:

D. M. S., Martinsburgh, Va., asks how to cure a sprain in the coffin joint. "I have," he says, "a very fine young horse that has sprained himself in that joint. It happened about six weeks ago and he is still lame from it—is it permanently curable?"

ANS.—If you are correct in your opinion as to the nature and seat of the injury—and of this we have no means of judging—you should treat it on those general principles which are applicable to all sprains. Give the animal rest; throw the sprained part out of use by shortening the toe, and putting on a high-heeled shoe; keep the injured joint enveloped, as well as possible, with bandages soaked in cold water, vinegar and water, salt and water, solution of acetate of lead, or other cooling lotion; when the inflammation and soreness have disappeared, apply a blister, (cantharides 1 part, lard 4 parts) to the front and side of the pastern, but not to the back, because of the bad effects which sometimes follow a blister, on that part. We cannot inform you in regard to the probability of a permanent cure, as that depends upon the degree of the injury, upon its exact location and also upon the changes that have already taken place in the part. It is always a difficult matter to say what is going to happen in such cases when one has the animal under his eye—it is *impossible* under other circumstances.

The Use of Muck.

J. S. Ryan, Queens Co., L. I., asks as to the advisability of his using muck upon his lands, giving no other data.

ANS.—The value of muck varies in different places. All chemical analyses show that it is of no great manural value. Nevertheless, we have used it with unquestionably excellent results, and we know of others who have used it without much apparent advantage. Much depends upon the character of the soil and sub-soil where it is used, and much also on the proper preparation of the article before it is applied. The best way is for each to try it himself.

[Fowl-Meadow-Grass.]

Jno. H. Williams, Washington Co., N. Y., asks where he can get some seed of Fowl-meadow-grass, which he wishes to sow on wet muck land, on which, though partly drained, the water stands in the spring and fall?

ANS.—Fowl-meadow-grass is a valuable grass for wet meadows; and seed of it can be purchased from R. H. Allen & Co. of this city.

Miscellaneous.

A. B. Dille, Johnson Co., Kansas, says: "The RURAL stated, some time ago, that there were three kinds of *fruits* that were fast being superseded, viz.: the coarse Concord Grape, the insipid Bartlett Pear, and the sour Wilson Strawberry. (1) Please state what they are being superseded by. (2) I would also like to know the best time to bud Oleander, and how to do it successfully. (3) Please give like information also about Kilmarnock Willow." (4) He also incloses leaf and flower of a plant for name.

ANS.—(1). For market varieties, perhaps they will never be superseded. They have been tested in many parts of the country, and have been found to yield more uniformly good crops than any others. It is an unfortunate fact for those who have to buy their fruit of markets, that quality is made quite a secondary consideration by those who raise the fruit to sell. But there are ten varieties of excellent fruits—such as apples, pears, grapes, etc.—offered in our markets to-day where one was offered a few years ago. Those who can now purchase Beyden 30 strawberries—Diana, Enmelan, Salem grapes—would certainly prefer them to Wilson or Concord.

(2). When the bark parts readily from the wood. This varies with the treatment of the plant, but can easily be ascertained by trying twigs from time to time.

(3). We think the Kilmarnock Willow may be budded now.

(4). Callirrhoe involucrata.

L. B. Santa Rosa, Sonoma Co., Cal., asks where he would be likely to obtain seeds of Ampelopsis variegata.

ANS.—Try Thorburn & Co., 15 John street, New York city.

L. E. R., Brandy Station, Va., having invented a means of preventing the noise made by the elevated railroads of this city, asks how the road is worked at present and to whom he should write to introduce his invention.

ANS.—There are two Elevated railroads; we suppose you refer to the "Metropolitan," on which road the noise is said to be unendurable. To describe its working would require more space than is here at our disposal. It is agreed that the noise is produced by the hammer-like concussion of the rim of the wheel striking the minute irregularities on the surface of the rail. That is what the plan must overcome. Either Mr. A. B. Pullman, the President, or Mr. Rapp the Sup't. of the road, would be the proper person to write to regarding this invention.

A Subscriber, Venango, Pa., asks at what figure he could purchase, in this city, dried apples, etc., through the RURAL Purchasing Agency.

ANS.—We could not make this purchase for our friend in a way to meet his approval, as we have not time at this season to devote to what would otherwise be a pleasure. Messrs. H. K. & F. B. Thurber & Co., New York, are the largest wholesale grocers, and would probably be the most satisfactory firm to deal with. As they also transact a large commission business, it might be to your advantage to send them your produce and trade it out. We no longer have a purchasing agency.

W. Hibbard, Niagara Co., N. Y., found on a Bartlett pear tree which is slightly blighted, a fly about three quarters of an inch long, and of a light color, also a number of nests containing eggs, presumably of the same insect, and in addition to these a large number of small red bugs, and he sends us a number of leaves to enable us to decide whether these insects might not be the cause of pear blight.

ANS.—On examining the leaves, we cannot see on them any evidence that they have been injured by insects.

Mrs M. Webber Mahoning Co., O., sends sample of plant for name and describes it as hardy perennial, recumbent, remaining in bloom six or eight weeks from the middle of June. A plant several years old covers almost a square yard, the dark green leaves nearly hidden by yellow flowers.

ANS.—It is Lotus corniculatus.

T. A. Mills, Orange Co., N. Y., asks: 1, Whether Japan Quinces will grow from cuttings; 2. Whether the fall is a good time to transplant blackberries, raspberries and cherry trees.

ANS.—1. It is best propagated from suckers and layers. 2. Yes, except for cherries; we should prefer spring for them in your climate.

WADSWORTH TOWER.

BLOOMFIELD, Conn., Aug., 1878.

DEAR RURAL:—It is not always the best known places that are most worthy of attention. I was never impressed with this fact more than when I recently made, in company with a few friends, a visit to "Wadsworth's Tower," a place of local resort for pleasure-seekers in this vicinity. In a former communication, I wrote that this township was bounded on the west by a line of hills known as Talcott Mountain. Many years ago, Daniel Wadsworth of Hartford, whose many acts of kindness, benevolence and munificent generosity, still keep his memory green, selected a fine plateau on the top of this mountain, where he built a villa for a summer residence. Adjoining the grounds is a beautiful lake about half a mile long and very deep, the surface of which is about 800 feet above the Connecticut River some eight miles away, and 600 above the Farmington, distant not more than three miles. On a high point near the lake Mr. Wadsworth erected a tower some 50 feet high, from which an extensive view of the surrounding country could be had. To this place all were made welcome. He named it Monte Video, but the public insisted on calling it WADSWORTH'S TOWER. The old man died many years ago, full of years and blessings; the property passed into the hands of strangers. The tower, which had become a landmark for miles around, was burned—but the name continued.

A few years ago a gentleman of intelligence, enterprise and love for the beautiful determined to rebuild the tower. Surveys showed that a peak at a little distance from the original site was considerably higher, beside having in its immediate vicinity many natural attractions. Here, at an elevation of a full thousand feet, Mr. Bartlett erected his structure, and built a small house for the accommodation of guests, also opening a new road for approach. From where I write, this tower is distant, in a direct line, 3½ miles; by the nearest road about five miles. The last part of the ascent of the mountain gives one an idea of climbing. In a distance of 110 rods we rose about 450 feet. This accomplished, we found ourselves at the point known as the Royal View, at the beginning of Royal Drive—and a Royal View it was. We were on the brink of a precipice. Hundreds of feet directly below us were the tops of tall trees; at a little distance ran the Farmington (properly *Tunxis*) River through a valley that was once the bottom of a lake,—but which is now covered with luxuriant meadows and cultivated grounds, and dotted with villages and farm-houses. A further drive of a mile or so along the level top of the mountain and we reach the Mountain House and pic-nic grounds.

Here we alight and leave our hampers—for although visitors can be supplied with good food and plenty of it, if desired, the almost universal rule is for parties to furnish their own provisions, depending on the house only for minor matters—tea, coffee and the like.

The view from this house is more extensive than from the Royal Drive. I have visited the place many times, and to me it has lost its novelty, and I am pleased to note its first effect on others. One will be attracted by the extreme distance, another by the apparent size of the lots into which the farms are divided. This one is engaged in observing the motions of workers in the field and that by the number of varieties of crops cultivated. I remember visiting the place some years ago with a lady who at first sight seemed overcome by the beauty and extent of the view. Then, as she seated herself she exclaimed, "Let no one touch me or speak to me for an hour."

But we must not stay at the house—our way to the tower is by romantic paths and over rocks, and shadowed by trees that give out fragrance from leaf and stem. We stop a minute at Mt. Philip on which is a pile of stones marking the spot where the bounds of three towns meet, past the Mohegan Monument, a curious result of the action of water, to see which we lean over a precipice in a manner dangerous to those whose heads are not steady,—and at last we reach the Tower, ascending it by an easy stairway. Our view heretofore has been confined to the west—here it extends in all directions for miles, and has been pronounced by those who have traveled extensively to be unexcelled by any thing similar in the world. To the north Mounts Tom and Holyoke, in Massachusetts, are clearly visible to the eye. The Valley of the Connecticut, 25 miles wide, lies before you to the east; southerly the lake lies at your feet, and the mountain divides the Valley of the Connecticut from that of the Tunxis—while westerly across the latter valley, line after line of hills rise one above the other, the last disappearing in the distance. By aid of the fine glass fixed on the top of the tower the view is rendered much more extensive. On a clear day Round Top, in the Catskills, is visible, and other points as far distant in other directions.

But your space will not admit of further description, and I must close with advice to such of your readers as may ever be in the vicinity, to visit WADSWORTH'S TOWER. L. A. R.

NORTHWESTERN ILLINOIS.

BAILEYVILLE, Ogle Co., Ill., Aug. 16, 1878.

THE harvest here is ended and threshing has begun. Most of the grain was stacked in good condition, though considerable damage was sustained from storms and hot weather at the beginning of harvest. The straw was unusually heavy and badly fallen, making it difficult to cut. The strength and efficiency of the various reapers, harvesters and self-binders were tested effectually, but most of them proved equal to the emergency, and a grand triumph for American ingenuity and skill in the construction of labor-saving agricultural machinery. Harvest hands were in demand at from $2 to $2.50 per day "and roast beef," for work at binding, and at $1 to $1 50 per day for other work. There were plenty of "tramps," but most of them refused to work for less than $3 a day, and some protested that they didn't want to work for only a few days, but wanted an all-summer's and all-winter's job!

As the threshing of the crops has only just begun in this section, we have not sufficient data as yet to estimate correctly the general average yield, but can say that the winter wheat and rye are above the common average in yield, and the quality good. There is but little winter wheat produced in this section, but a considerable amount of rye. Barley is yielding well, but the quality is poor—the most of it will grade "No. 3" and "Rejected"—as it was colored by the wet weather just previous to harvesting it. Oats are mostly good both in yield and quality. Spring wheat is variable—some good and some quite poor—damaged by blight, rust, etc. We can soon be able to report more definitely "what will the harvest be."

Corn is doing finely now, and if frost does not come too soon this crop in the West will be a large one, contrary to the general expectations on the first of July.

Potatoes also promise a large yield, though there have been some symptoms of rot. Garden vegetables of nearly all kinds were never better or more plentiful than they have been this season. Potatoes are a drug in the market at 25 cents per bushel; cabbages 3 cents per head; and other things in proportion.

Good dairy butter has been selling all summer at 9 to 12 cents per pound, and inferior as low as 1½ to 2 cents per pound for soap grease. It doesn't pay to make poor butter at any time, and especially these times when such wide differences are made in the price, according to quality. Our first-class western creameries and well-managed dairies are doing about as well as any other kind of business, but slip-shod farm dairies

are running at a loss.- The present prices of butter in Chicago are as follows: "Fancy creamery, 20@23c.; choice do., 16@19c.; dairy do., 13@15c. for fancy; 10@12c. for extra do.; 9@10c. for good sweet straight-colored do.; 7@8½c. for fair; 6@6½c. for common; 4@5c. for inferior." It takes as much milk and harder work to make a pound of poor butter than to make a pound of the best quality. Further comment is unnecessary.

The times appear to be improving in this part of the great West, and a long season of prosperity is hopefully anticipated. With the present abundance of everything and low scale of prices, all real wants can be supplied. Let the people be patient, watchful and industrious, and live within their means, and all will be well.

W. B. D.

KANSAS LETTER.

SUMNER Co., Aug. 15, 1878.

THIS county was organized in 1871, with a population of about five hundred. So rapid has the settlement been that the inhabitants now number 13,000. The people are enterprising, progressive and intelligent. The society is as good here as in the older States, as is evidenced by the numerous school-houses and church organizations. There are 110 organized school districts in the county with a commodious and comfortable school-house in each.

Wellington, the county-seat, is beautifully located, and contains a population of 1000. It has a good, substantial court-house, a bank and an excellent flouring-mill. The M. E. church now in process of construction, when completed, will be a handsome and creditable edifice. The county is well watered by three rivers; the Arkansas, Ninnescah, and Chicaskia and many other streams of less magnitude.

The scarcity of timber which was once urged as an objection to the country, proves to be of little consequence. Lying adjacent to the Indian Territory, as this county does, most of the fuel consumed has been procured from there; consequently the supply of timber has not been materially diminished in this county. Beautiful groves of forest trees now dot the prairie, which in a few years will be sufficient to supply all the fuel needed here for the next century. There never has been an absolute failure of crops since the organization of the county. In the summer of '74 corn was very poor, in consequence of the extremely dry weather. The wheat crop, however, was good that season, and there have been no justifiable grounds for complaint of any crop since.

This year 85,250 acres of wheat were harvested which will average between 22 and 25 bushels per acre. Reports from various localities since threshing commenced, give the yield as from 17 to 44 bushels per acre. This is evidently one of the best wheat-growing counties in the State. This is a broad assertion but the agricultural statistics of Kansas will bear it out. Even sagacious farmers would argue that a soil so well adapted to this cereal would not produce corn. This error prevented a large acreage from being planted until it was exploded by actual demonstrations. Corn has been successfully grown here for six years. The present season there are 41,343 acres which will yield no less than fifty bushels per acre. Farmers from various localities declare they never saw better corn growing, and estimate the yield of many fields at 75 bushels per acre. Potatoes are excellent.

Peaches cannot be surpassed in the State for size and quality. They were marketed here as early as June 10th and pronounced as fine as any grown in the great fruit belt of Michigan.

Very few apple trees were old enough to bear this season. This county, however, has produced apples equal to any in the State. Grapes are now in market and compare favorably with those grown on the vine-clad slopes of France. The condition of several fields of timothy, blue-grass and clover is a striking proof that these grasses can be successfully grown here. For a diversity of crops this county is in the front rank.

Notwithstanding the stream of immigration which has poured among us, land is still cheap. It is a large county and can sustain a population of 30,000. Land ranges in price from $3 to $15 per acre, according to locality and improvements.

ALBERT BROWN.

WEST VIRGINIA NOTES.

CHARLESTON, Kanawha Co., W. Va., Aug. 17.

THE fruit crop is very light in this section of the country this year; peaches in particular are scarce, there not being many raised in the Valley as they do not thrive well. The trees flourish for awhile but soon die, not bearing more than one or two crops before they commence withering up. It seems that small worms and insects bore in the roots of the trees, and there doesn't seem to be any remedy for it. In hill land it is different, and peaches are raised in abundance, the worms not bothering the trees, and the elevation of the land being particularly adapted to the nature of the fruit.

Apples are not so plentiful as usual, there not being much more than half a crop. There is plenty for home consumption, and those who have to buy feel the scarcity more than the farmers. It is a matter of great trouble to our farmers to save their apples through the winter. Ill-success is certainly not due to carelessness; for I have frequently seen men who had fine orchards gather their apples carefully, and put them up, some in cellars, some in garrets and others in barrels, and long before Christmas they would be rotten. Why this is I am unable to understand; for the same variety of apples that are shipped hither from various places, are perfectly sound and remain so through the winter always commanding a good price.

Tobacco is raised by most of the farmers, and is their principal money crop, but this year the money part failed, tobacco being worth so little that it hardly paid for the trouble of shipping it. Those who were able waited for a better price, but the price has risen very little if any, leaving them to chew it themselves or sell it at reduced prices.

Wheat, though not so good as expected, is very low, not being more than seventy-five or eighty cents per bushel, where before it ranged from one dollar to a dollar and thirty-five cents per bushel, and was scarce at that. Oats are raised by almost all of the farmers and will be only a moderate crop this year. Rye and barley are raised only by very few persons as there is very little demand for them. Millet is something that is very little grown and I think I can safely say that there are not more than one or two persons in the county that cultivate it, there being only one that I know of. It would be a great help to the farmers if they would raise it to use while green for stock and save hay and other feed for winter.

E. B. D.

RURAL SPECIAL REPORTS.

ALLEN Co., KANSAS, June 22nd 1878.

IT would be wise in those thinking of immigrating to this State to do as the Pilgrim Fathers did, on striking Plymouth Rock—stop. All the immigrants, this season, or at least eight-tenths of them, are making a great mistake. They are jumping over a country from fifteen to twenty-five per cent of which is timbered, and going into a part of the State where there is often none within fifteen miles of the settler, while, in some parts he will have to travel from thirty to fifty miles for fire-wood or timber and as far or farther for lumber. Here, in the eastern part of the State, we can get our lumber by going a few miles for it, at half the price which those living further west, have to pay for it; while wood can be had on the farm or by going a few miles for it. Moreover, coal is to be found in almost every county in this section. Another important point is that we are a hundred miles, more or less, nearer to market, an important consideration where, as here, freights are high. Then, again, we have the advantages of villages, churches, schools, and bridges, all of which those settling in the western counties of the State must be without for years yet.

Like myself, on my first arrival in the State, others may think that as this region has been settled so long, land would naturally be dear, and thickly populated. But to learn the price of some of the splendid farms here, would surprise many Eastern farmers living on high-priced rocky, hilly, hard-pan lands. As for unimproved land, it is extremely level or slightly rolling, but in both cases the soil is very deep. All a man has to do is to hitch his three-horse team to a plow and carve out a farm. A man with some means—and the more he has the better—can accomplish more here in a couple of years than the old settlers did in a score between Lake Erie and the Atlantic. I don't mean that he'll get richer, for he will have to wait until his land appreciates in value, but he can make for himself a nicer and more comfortable home.

To do this, however, a man must have some means. With a small capital, or none at all, this is a poor place to come to; and in nine cases out of ten the impecunious new-comer would strike back disappointed for his old home—if he thought there was a chance of ever reaching it.

A. W. WILCOX.

PURPLE CANE, Dodge Co., Neb., Aug. 18, 1878.

OUR country is composed of two levels, one the Platte River bottoms, always under water in spring, and the Bluff or Table-land, sometimes dried up in a specially dry term. This year we have had a very great amount of rain, falling gently, but so nearly continuously during May, June and July as to render cultivation on the bottoms and in the "sags" on the bluffs, nearly impossible. Corn is a failure in the wet lands, fair on the medium and on slopes where surface drainage is natural, and extraordinarily good on dry land. As near as I can learn, the crop will average over 110 in amount and in quality throughout the country, but will be in the hands of comparatively few. I am among the particularly favored ones.

Wheat, rye, oats and barley had, even on wet lands, an extra growth, but it proves to be blighted, rusty, fallen and chaffy, about as the corn crop is distributed, and in my opinion was not fully fertilized, as the rainy season kept the pollen in a soft, mushy state, unfavorable to that process. The crop prospects are, however, very good from the greatly increased acreage.

Fruit growing is confined to the southeast corner of the State; we know but little of it here.

Stock is in extra condition, from the earliness and abundance of young grass all the time. Our farmers are in good spirits, believing that the worst of the hard times are over, and that a good time is coming.

DE WITT, Clinton Co., Mich. Aug. 19.

CORN here is good. The growth during May and June was slow and unpromising, but the warm weather of July brought it forward rapidly. The stalk has not pushed so high, perhaps, as in some seasons, but the ears are large and well filled, and the yield, both as to quality and quantity, will be good.

Wheat, of which the acreage was large, is turning out well. The crop was in general well secured, though on account of its ripening fast and all at once, and the scarcity of help, there was some loss from the grain shelling. The Clawson gives the best yield. Oats came in light.

Potatoes are fair. The beetle has ceased to be a terror here.

Of fruit we have nothing to boast of. Apples about one-fourth of a crop; though the markets are over-supplied with early ones. Farmers in setting out orchards have given more space to perishable summer sorts than is profitable; but we have many pears, and the same may be said of grapes, though there will be more of these than the May frosts would have led one to expect. Plums hardly worth mentioning. This is a "poach year" with us, and though the fruit has dropped badly, we can still claim to have peaches.

A. E. S.

HANAWA FALLS, St. Lawrence Co., N. Y., Aug. 15.

THE wheat crop has been an average one, but that sown early was injured by drought, and later has been cut through the long-continued rain, and has been damaged one-third in value. Rye, both winter and spring, was damaged by drought about two-thirds of a crop. Oats the same. Corn never looked better in this county; it will be above the average if nothing befalls it. Barley an average crop. Potatoes about half a crop; early ones were hurt by frost, drought and bugs; later are being stricken with rust. The fruit crop about an average; more red plums than for ten years before.

Peas were nearly a failure on account of the drought. Onions, multipliers, good; from black seed the prospects now are fair; beets, parsnips, carrrots, never were better. Cabbage will be a fair crop. Hay was an average, some low meadows were hurt by frost in May. For the past three weeks we have had more rain than we have had for twelve years in the same time.

G. R. C.

OSBORNE CITY, Osborne Co., Ks., Aug. 17.

WE have a beautiful country out here—a very grand country. Rich soil, good climate, and an excellent class of people. The county was first settled in 1870, when about thirty took up their homes here. It now has a population of over 8,000, and not less than a quarter of a million bushels of wheat were raised here the present season. The corn crop also is very heavy.

We raise this season good winter wheat, average 20 bushels to the acre; good spring wheat, average 18 bushels to the acre; rye, average 20 bushels; oats, average 40 bushels. The corn will yield 40 to 50 bushels, shelled, to the acre. Irish potatoes are abundant; sweet potatoes excellent; peanuts do well; all kinds of garden truck are abundant. Fifteen inches of rain fell in the past month.

The people all came here poor—some very poor—but there are no tramps here. Plenty of work for all, and plenty to eat, and to spare.

D. W. C. O'N.

BARRY, Pike Co., Ill., Aug. 16, 1878.

WINTER wheat, of which more than a usual breadth was sown, was very good, but the yield only about one-third. Of spring wheat none has been sown. About an average breadth of oats was sown, and the crop is more than usually good. Hay crop very large. Of corn hardly the usual acreage was planted. That which was well attended to is good; but owing to the wet spring, and early harvest, a good deal of it has been neglected, and therefore the prospect is of less than an average crop. The early potatoes are good; poor prospects for those put in late, but not many were planted. All small fruit very abundant. Peach crop very light, so is the apple. Not half of the farmers will have what they would like for their own use. Not more than one orchard in a hundred, on an average, will yield any for market. This report applies to Pike and the southern part of Adam and Brown counties.

J. F. L.

COLEGROVE, McKean Co., Pa., Aug. 22.

The prospects of the corn crop here are very good, I don't think they were ever known to be better.

The wet weather put farmers back in their haying so that they have just finished. The hay crop is unusually good, and many are saying they never cut so much before. Oats, which are the staple grain product here, are yielding well. Potato vines are blighted by rust, and late planted will turn out "small potatoes;" everybody is prophesying that they will be "high" next winter; they are, at present, $1, per bushel. Fruit is a failure; orchards usually bearing from one to two hundred bushels, will not yield more than five or six.

B. N. H.

LOWELL, Walker Co, Ala., Aug. 18.

The corn crop in this particular locality is decidedly poor—as near as I can judge, about half a crop. It was largely injured by drought, and covers a comparatively small area. It is said, however, we shall have an average crop for the whole county, the yield being very large in some parts of it. The corn crops in adjoining counties are reported very good. This part of the county does not figure very largely as a corn-producing section; enough being produced to meet the local demands only. The wheat crop was poor in yield, as in quality. The apple crop is very good, and also the peach crop, where orchards are properly cared for. The drouth was broken the 10th.

B. A.

HOWARD LAKE, Wright Co., Minn., Aug. 16.

THE crops within a radius of ten miles of this place, are better than for two or more years past. Wheat, from 15 bushels to the acre, has mounted up to as high as 30 in some fields. About twenty miles south of this, the wheat was laid so low by wind, that it was mowed with a scythe. Oats are very, barley tolerably, good. Potatoes about two-thirds of a crop. Corn good—about fifty bushels to the acre. Hay is also good. Weather has changed to the pure bracing air, which we have so much of in this State.

S. A. M.

WATSON, Allegan Co., Mich., Aug. 19, 1878.

HAYING and harvesting are over, and thrashing has commenced. The yield of wheat is not so large as many anticipated from the growth of straw, probably owing to the extreme wet of last spring. Oats, poor from the same cause. Corn will be only a moderate crop. Hay good. Early potatoes light. Fruit of all kinds about medium. Good weather for harvest, except heat. Prices low: wheat 95c. Farm wages from $8 to $16 per month and board.

H. D. E.

ELMIRA, Chemung Co., N. Y., Aug. 17, 1878.

THE corn crop in this part of the country promises to be very fair; the very warm weather we have had and the rains have brought it forward very rapidly, though it was late getting started. The apple trees are quite loaded with fruit. Pears are doing better than for several years, though they are still suffering with the blight. Plums are very abundant.

H.

MILFORD, Barton Co., Mo., Aug. 16.

OUR wheat crop was light, too much rain through the winter. Oats very good, 50 to 75 bushels to the acre. Corn will be fair, though planted late and poorly cultivated on account of so much rain. Stock of all kinds look well, though very low prices are paid for the animals. Apples scarce; peaches, pears and smaller fruits plentiful. Money scarce.

A. B. S.

EDGERTON, Johnsen Co., Kan., Aug. 13.

THIS is a prosperous year for Kansas. Wheat and oats were very heavy; vegetables fine, with the best prospect for corn we have ever had. It is now in roasting-ears, and we are having plenty of rain. Peaches will be plenty, but apples a failure. Small fruits were in abundance. Bees never did better; mine have their boxes nearly all full now.

A. B. D.

NEWTON, Sussex Co., N. J., Aug. 20.

THE corn is growing yet, and is loaded with very heavy sets, but I think it wants a little more sun to bring it around all right. Buckwheat is looking fine; the fields are a splendid sight, white with blossoms and covered with honey bees. My father-in-law sold his apples for 75 cents per bushel in the orchard. They are splendid.

A. V.

GAYLORD, Smith Co., Kan., August 17, 1878.

THE prospect for the corn crop here this year is the best that we have ever had. We shall certainly get from 50 to 75 bushels per acre. Other crops, also, are good. Small fruits are a success; large fruits are not grown, as the country is new; it being only seven years ago that the first settlement was made here.

A. C. W.

CHURCH ROAD, Davidson Co., Va., Aug. 21st.

THE tea plants sent out by the Government to our part of Va. are doing well and our people take much interest in the experiment. The crops in this district are good.

T. E. O.

POQUONOC BRIDGE, Hartford Co., Conn.

OUR July was remarkable in its heavy southwest winds, some days blowing a complete gale, and continuing all through the month.

M. W.

OSWEGO, Oswego Co., N. Y., Aug. 17.

THE corn crop has not looked as promising in years; and more than the average number of acres are planted.

S. O.

PHASES OF HIRED HELP.

Vice seen too oft, familiar with its face,
We first endure, then pity, then embrace.

Nor is this true of vice alone, but also of many of the petty evils, annoyances, inconveniencies, and misfortunes of daily life, and especially of incompetent, distasteful, or incompatible hired help.

As soon as a new hand is engaged, we at once set about instructing him in the duties he will have to perform. Sooner or later, the length of time depending on his aptitude and industry, he becomes familiar with the routine of his work. So long as the newcomer continues a "new broom" he may impress us with the belief that he is just the man we wanted—the right man in the right place. But it sometimes happens that so soon as the notion enters into his mind that his situation is secure, that his services are so highly valued as to be substantially indispensable, just so soon does his conduct often change for the worse, and this though his treatment may be as considerate as formerly, and his remuneration equally good. He becomes less respectful, less assiduous and thoughtful; though no addition may be made to his former duties, and though he may still have the same facilities for properly performing them, yet he first neglects one thing, and then another. Although he may have abundance of time, yet he often shirks and slights his work whenever he can do so without the risk of immediate detection, and—a natural result of such conduct—he becomes untrustworthy.

Although all this may be apparent to his employer, yet remembering the valuable services of which his help may have shown himself capable, and dreading the tedious ordeal of breaking in another to supply his place, he may often feel disposed to permit his unsatisfactory hand to retain his position, in the hope that he may see the evil of his ways and reform. Frequently, however, this hope is disappointed; the man's conduct becomes unbearable, and he is finally discharged, perhaps after years of service.

Again, we have known instances in which utterly worthless men have been retained for years on the farm, because their plausible ingenuity gave a false appearance of value to their services. Perhaps they were possessed of considerable mechanical skill, and by deftly mending broken implements or handily executing odd bits of carpentry or painting, cunningly caused these occasional trivial jobs to stand instead of that hard, every-day labor on the farm, which, however profitable in its remote results, makes but little immediate show.

Then, again, in farming sometimes, but still oftener in mercantile life, there occur striking instances where utterly unprincipled men, by studying the weak points in their employer's character, and cunningly employing obsequiousness, subterfuge, misrepresentation, or sullenness, as occasion may require, have obtained absolute control over him and his business, and sometimes indeed over the entire family. In this they are often aided by gradually filling all vacancies about the place with creatures of their own type, and their own selection; by alternately treating their employer with bland submission and premeditated sulkiness; and by losing no opportunity of impressing upon him the vast extent of their own abilities and the absolute necessity of their aid to the success of his business.

Although, at the outset, the employer may only temporarily "endure" these diplomatic tricksters, yet habit may soon lead him to "pity," and finally to "embrace" them rather than suffer them to quit the business which, owing to their arts, might then be more justly called theirs than his. Although few men have ever stepped out of the most exalted positions in this world, and still fewer out of merely subordinate places in it, who could not be replaced, yet he has been educated to believe their services indispensable, and though groaning under their whims and edicts, is forced to retain them in control of his business.

We believe that so soon as an employer is satisfied of the incompetency, untrustworthiness or incompatability of those who work for him, the sooner a separation takes place the better for both sides, and that the upright employer, who, while wishing to retain his own manliness and independence, treats his help courteously and fairly in every respect, will in all cases strictly adhere to such a course.

RURAL NOTES.

The nights are cool at the Rural Grounds, and melons ripen slowly.

Pearl Millet grows surprisingly, and it would seem that this will prove of high value as a forage plant. Speaking with Col. Weld, who attempted its introduction before the war, we asked why its value did not at that time become known. He said that as it does not seed in this climate, the war, which soon followed his tests, cut off communication with those sections from which seed might have been procured. It is quite useless to plant the seed early. The entire failure of those sown at the farm was due, no doubt, to early sowing alone. As between this millet and corn leaves, both having been placed before them, we do not find that horses and cattle display any preference. The seed was sent to us by Mr. Wm. H. Carson, of this city, to be tested. He has distributed it liberally about the country, and to him is due whatever credit may accrue from its re-introduction.

If we were to judge from the present season's tests, we should pronounce the Acme the best tomato in cultivation, and our readers are well aware that we have given some attention to comparative tests between all of the new or well-known varieties. The shape is perfect, being nearly round, without the appearance of a seam or lobe. It is as large as it is desirable a tomato should grow. It ripens evenly and early, keeps well after it is ripe, and is notably firm, for which last reason, if not especially for the others, it will prove a favorite sort with market gardeners.

HELIOTROPISM.

As a rule the growing stems of plants incline towards the sun when they depart at all from their naturally more or less upright position. This curvature is supposed to be owing to the slower growth of the parts most exposed to the sun. Whence it would follow that plants which are shaded on every side grow faster than those that are exposed to light, and this is found to be a fact. We have observed, this season, that the growing shoots of several of our pear trees bend away from the sun, or rather they bend towards the north and northeast. The inclination varies with different trees and different branches upon the same tree. In the case of a Winter Nelis some of the top shoots bend over towards the north-east more than ninety degrees, forming an obtuse angle with a perpendicular. The lower branches growing on the south of this tree are twisted around towards the north as far as north-east. The long, slender branches of a Jos. de Malines bend over towards the north as uniformly as if they were receiving a strong, steady wind from the south. When the stems bend toward the sun they are termed positively heliotropic; when they bend away from it they are termed negatively heliotropic. Accepting the theory that a less growth on the sunny side causes the former, we have never heard of any sensible explanation of the latter.

WE WILL EXPLAIN.

Several of our friends have asked, "Wherein is the RURAL enlarged?"

Considering the expense which the change necessitated, and the additional cost which it entails, we are a little disappointed that such questions should be asked. Borders have the effect of making papers seem larger. These were removed from the RURAL as neither useful nor ornamental, and this removal has perhaps rendered the enlargement less apparent. If those of our friends who have not perceived wherein the enlargement consists, will take the pains to measure the printed matter, they will find that the columns of the new RURAL are three-quarters of an inch longer than those of the old. There are sixteen pages in the paper, and four columns to a page, making sixty-four columns, which, multiplied by three-quarters, will give forty-eight inches of extra reading matter. As in the old pages there were fifty-three inches, it follows that we have added, by lengthening the columns, an entire page, lacking five inches, which are made up by a trifling addition in the width of the page. This, as we remarked at the time, amounts to the same as issuing a four-paged supplement every four weeks. Whether the change is perceptible or not to our readers, we are confident that it is perceptible to those who have to fill its columns with reading matter, and pay for setting up the type.

AMUSEMENT AT FAIRS.

THERE is a little too much of the Gradgrind in much that is written about Agricultural Fairs lately. The desire is to have them more instructive, useful, practical. There is opportunity to improve them in this direction. We can, and ought, also, to exclude all demoralizing associations, gambling, drinking, and the like. But we must not exclude the idea of amusement, of recreation, or we lose what is by no means of the least consequence. Farmers have too few amusements. We believe that Fairs might be usefully developed in that direction until even the circus would be rivaled in interest to the boys and girls, the young men and maidens, to say nothing of the old men and matrons. Let us have plenty of fun at the Fairs.

THE BEST FODDER CORN.

THE best fodder corn is that grown thickly in drills—so thickly that no ears are developed. Let the ground be rich; let the cultivation be thorough; cut up when the tassels are dropping their pollen; let it wilt on the ground; tie in small bundles and set up in small stooks, binding firmly at the top, and also half way down. Then let it stand as late as possible before carrying to the barn. If the crop is planted early, it may be cut up so early as to get perfectly dry, if it has no ears. Then we have no moldy fodder, and our opinion of sowed corn improves until at least we may say, with JOAB HARGOOD, that it is worth as much as the best hay.

CLEAN TILLAGE.

The present season yields the thirty-sixth wheat crop which Mr. J. B. Lawes has raised upon the same unmanured plot. He thinks it will yield ten bushels per acre, which is more than the average yield of many parts of our own country. It would have been considered impossible that any soil could produce such an amount of wheat, after so many years without any manure whatever, and it seems to show what clean tillage can do.

Fatality From Impure Well-water.—The evils of impure water have been frequently discussed, often with only slight benefit in a sanitary way, but at Little Neck, Long Island, there has lately been preached on the subject a powerful sermon, which ought to appeal to the heart and the head of every householder. John Ryan's house there was a handsome structure in the midst of elaborately ornamented grounds, yet two years ago, despite the efforts of the best medical skill, he lost, by dysentery, two of his children, whose deaths the physicians attributed to the use of water from a well on the premises. The well was cleaned out, and the evil effects of the subsequent use of its waters lay dormant until about a fortnight ago, when Ryan himself was attacked with the disease that had already robbed him of two of his children. A few days later two more of them were stricken by the malady, and died in less than a week. Last Wednesday morning Ryan himself passed away, and was followed in the afternoon by his mother-in-law. The wife and one child alone survive of the family, and probably their systems are impregnated with the poison from that pestiferous well.

The Animus.—The loafer's communism is simply a manifestation of the too general desire to live idly on the fruits of other men's labors. This desire exists as strongly in the hearts of denizens of Wall Street and the Fifth Avenue, as among the frequenters of the slums and saloons and beer gardens. It fires the souls of politicians, speculators, and various other friends of the dear people. It is the foundation of every aristocracy, and the source of all demands for special legislation, and the grant of privileges and monopolies, whatever the specious protest. It is the constant danger of republics, no less than of monarchies.

BREVITIES.

"RELIGION never was designed
To make our pleasures less."

THE apple and pear crops are much under an average in England.

Mr. Wm. E. Dodge believes the fountain-head of the hard times in the whisky bottle.

THE Herald wants an *honest* editor for our next mayor! There ought to be no difficulty surely.

THE statement is repeated from many different sections that the yield of wheat is not so large as was anticipated from the growth of straw.

Mr. MECHI says, "In justice to my laborers who have served me faithfully for over thirty years, I may say not one is given to excess in drinking."

Mr. RICKETTS tells us that the Lady Washington grape is doing finely this year. There are some very large bunches. He thinks they will ripen before Concord.

IN SELECTING Weigelas, it is well to bear in mind that W. rosea, W. amabilis, W. hortensis and W. Lavallei form a varied group though not all blooming at the same time.

THE Pearl Millet of which we have been giving reports, is, according to Willdenow, Penicillaria spicata; according to Miller, it is Panicum cœruleum: and according to Richard, it is Pennisetum thyphoideum.

WE have received Parts VI, VII and VIII of Meehan's Native Flowers and Ferns. These parts sustain in every way the general excellence of the others. We are glad to hear of the success of this work. It is not likely to meet with a success beyond its deserts.

WE HAVE visited several vineyards in this section of country and find that the grape crop was substantially destroyed by the late spring frost. Concords have suffered as much as any, while more backward varieties, like the Delaware, will bear an occasional bunch.

WE would remind our readers that we are close upon the best time of the year for outside painting. The great objection to painting during hot weather, seems to be that the heated boards absorb the oil, leaving the lead in the form of a dry powder, which rubs off as freely as whitewash.

Mr. HENRY STEWART tells us that he places a little hill of slaked lime about his fruit trees every spring, and finds it an effective remedy against the borer, Saperda bivittata. We have never been troubled much with this borer, and have attributed it to the use of the wash which we apply to the stems two or three times every season.

A COMPLIMENT FOR THE RURAL FARM.—R. H. ALLEN & Co., the well-known seedsmen of this city, have received specimens of Clawson wheat, from various sections of the country, with the object of determining the best from which to select their fall stock. A bushel was sent from the Rural Farm, merely for comparison. The color was rather darker than some of the samples, but the kernels were decided to be the largest and plumpest.

LARGER yields may be got from hoed crops planted in drills than when planted in hills. This is true of corn, potatoes, beans, or any other crop of the kind. But it is not a good way on weedy land, or for a slovenly farmer. The rows should be as straight as a line, and at accurately even distances. Cultivation must be frequent and thorough. Proper implements should be used by skillful hands. These things promised, the drill system gives satisfaction.

Literary Miscellany.

UNNUMBERED GRAVES.

YON hillside with its shafts of gleaming white,
Bathed in the glory of the setting sun,
Holds many a grave where, hidden from our sight,
Some loved one sleeps, life's toil and labor done.
But there are graves over whose slumbering mold
No polished marble rears its stately head,
And where no fragrant flowers above unfold
To waken pity for the quiet dead.

These are the graves deep down within our hearts
Where lie the hopes and dreams of early years,
Buried from sight, but signalled by such marks
As only can be made by blood and tears—
Some early love that crowned us in our youth,
And made life glorious for a short sweet hour—
Some cherished promise, robbed of strength and truth—
Crushed in the morning of its new-born power.

Here is the spot where memory has engraved
The form and face of one we called a friend,
One for whose welfare we would e'en have braved
Censure and heartache to the bitter end.
But 'twas not wisely done and so we draw
Before the treachery of the smiling eyes
A heavy veil. The cold world if it saw,
Would proffer pity in a thousand lies.

So life goes on. We lay the forms away
Of things we loved not wisely but too well,
And in the lapse of years we learn to stay
The fretful chanting of their funeral knell.
We learn to smile, before the smiling throng,
Although the adder's fangs be deeply set;
And join, perhaps, our voices in the song,
To soothe the pain we never can forget.

And thus we learn to envy the calm rest
Of those who sleep beneath the sod.
Bound with life's galling chain, we know 'tis best
To bend our heads and pass beneath the rod.
And when we see some mourners heavy clad
In robes of black, haggard, with tear-dimmed eye,
We know their lives would be more bright and glad
Could they but reason—it is but life to die.

Mourn not the slumbering dead, but rather say,
Blest are the sleepers. Years may come and go;
Heads that are brown and gold may turn to gray;
But they are done with earth and tears and woe.
Somewhere, we know, beyond the world of stars,
They would at last have found sweet Lethe's stream,
Some time we'll meet them at God's judgment bar,
Where life is love, and love one long true dream.

(Ogden Freeman.

THE STORY OF A LETTER.*

JULIA KAVANAGH.

EVERY one has heard of Sir John Percy's great lawsuit. It is a great trouble to Sir John. At least, he says so; his first, he calls it; but I always thought that his troubles began with his name. He claimed to be a real Percy. Ill-natured people said that his grandfather had been a greengrocer: this may be true, or it may not, but I never knew a more honorable, noble-minded man than Sir John, and I mean to say that, whatever his real origin, the Percys might have been proud of such a kinsman. There would, therefore, have been little harm in his claim of noble descent, which no one had ever dreamed of opposing, if good Sir John had not thought fit to strengthen it by assuming the temper and department of Hotspur. One of his favorite theories was "race," and the transmissions of hereditary peculiarities.

"Look at me! Am I not one of the old Percys in physiognomy as well as in blood? And unluckily for me have I not got that dreadful Hotspur temper which, as it cannot be vented in rebellion, or on a battle field, has brought this eternal lawsuit on my hands?"

I groaned, for about one part of this statement there could be no doubt: it was the Hotspur temper that had brought on this lawsuit, and as I candidly believe that Sir John acquired that temper to prove his descent from the same illustrious line as gave Chevy Chase its hero, and Lord Douglas his enemy, I am justified in my assertion that his troubles began with his name.

Amongst the troubles of Sir John there was one which seemed to me as real as his relationship to the Percys. He complained that all his letters did not reach him, and he laid the blame to his legal opponents. At first, he concluded that they had an agent at the post-office; then he gave up this crotchet for one as improbable, but at least more plausible: the agent was not in the post-office, but out of it; and it was his habit to waylay the postman, and either bribe or drug him, as he might find most convenient; then abstract Sir John's letter—for this knowing agent never took but one letter, though, of course, it was always the right one.

This explanation of his losses, however, had to be given up as well as the first; and Sir John's third and last conclusion was the saddest and most ominous of the three, so far, at least, as his peace of mind was concerned: he declared that the agent was one of his three female servants. His only man servant, James, was incorruptible; but Mrs. Green, the housekeeper, Ann, the cook, and Martha, the housemaid, did not, unluckily, belong to that immaculate category. They were changed repeatedly—Mrs. Green became Mrs. Long, Ann and Martha turned into Eliza and Mary, a Braham lock was adapted to the letter-box; but letters—important letters, said Sir John, all referring to his lawsuit—continued to be lost, or, what came to the same thing, not to reach him.

I began to feel staggered. Sir John was positive, and though very angry, he preserved a sort of calmness in his anger which was unlike Hotspur's wrath, and helped to shake my skepticism. There could be no harm, at least, in trying to assist him out of this difficulty, and I undertook to provide him with a thoroughly reliable servant-girl. I applied to my sister-in-law in the country, a woman of strong sense and much penetration. I sent her down on account of Sir John's predicament, and begged of her to let us have a good, sensible, and honest girl, if she knew such a person in her neighborhood. Sir John preferred a girl from the country. "It is the lover who ruins everything," he said, "and the lover is the growth of time. If I can have a fortnight's fidelity, I shall be well pleased." By return of post my sister-in-law wrote: "I have got the very girl you want: she is a heroine, neither more nor less. She spent ten years in my cousin's family, and saved their youngest child from drowning by her presence of mind. Twice the house was attacked by burglars, and twice Nelly displayed the calmest courage. On one of those occasions she was *alone* with the children. Her fidelity is beyond suspicion. I defy any one to bribe Nelly. For the last three years she has been engaged to a young man of the best character, a carpenter; and it is for his sake as well as not to leave her mother and her little sister, that Nelly would not go to Australia with my cousin. The children were broken-hearted at the parting."

This high-flown eulogium concluded with the intimation that Nelly would be very glad of a situation in Sir John Percy's household, and especially of the liberal terms he offered, and that she would leave S—— at once, and call upon him the next day.

Sir John was taking his breakfast, when Mary, the housemaid, came in and said that "a young person wanted to speak to him."

Great was Sir John's surprise when the heroine of my sister-in-law's letter entered. A little childish thing stood before him.

"Why, my dear, how old are you?" he asked in some dismay.

"Twenty-five, sir," replied a quiet little voice.

Sir John looked at her. Yes, there were some of the lines on that young face. And, though it was a young face, with slight features, it was a remarkable face in its way; pale and resolute, with dark eyebrows, and dark eyes looking quietly at you from beneath their arch. "What is your name?" he asked a little abruptly.

"Ellen Kelly, sir."

Yes, she was Irish, and that was a drawback. Not that the prejudice which forms a part of the traditionary John Bull found any room in Sir Percy's mind; but he had been jilted, poor fellow, by an Irish girl, who had Ellen Kelly's eyes, and he considered this coincidence ominous. He assured me afterwards that if it had not been for my sister-in-law's sake, he would have sent Ellen back forthwith; he said so, but I rather doubt it. I have a fancy that those eyes of hers were pleasant to the good old bachelor—a memento of his young days that had a charm of its own.

"Well, Ellen," he resumed after a while, "I have heard a good account of you, and I trust you will justify it. Though you are but a small thing to be a heroine, we all know that the best goods are made up in the smallest packets. I am a good deal out, all on account of a confounded lawsuit which I have had in hand these thirty years, and I want a faithful, trustworthy servant to sit in this room and receive my letters. The housekeeper will give you some needlework to amuse you, should you need such entertainment; but you are to sit here from eight in the morning till twelve, and from two in the afternoon till evening. When you feel tired just touch that bell, and James will come and relieve you. He is too old and too active to bear the confinement—otherwise I should require no one else. And now, Nelly, please to mind my words. I suspect neither the housekeeper nor either of the two servants. I have laid traps for them, and they have come out of the snares white as driven snow; therefore I have no right to mistrust them; but I expressly desire you to act with as much prudence as if they were one and all bent upon stealing my letters. In short, you may be as civil and as friendly as you will, but you are not to trust them. That will not be pleasant, will it, eh?"

"No, sir; but I knew as much before coming."

"Well, then, as I said, you shall sit here and sew. When the postman comes, go and take the letters from him. I had a box, but I have suppressed it."

"And where shall I keep the letters if you are out, sir?"

"In your pocket, my dear; and do not let a soul lay a finger on one of them till I come in, and you hand them to me."

"Very well, sir."

"That is all, my dear. You have relatives, I believe."

"Mother and my little sister, sir."

"Do you expect any letters from them?"

"Mother can't write, sir, and my little sister is only seven."

"Nevertheless, you expect to hear from them?"

"We have a friend, sir," replied Nelly, blushing a little, "a sort of relation of ours, who will let me know how mother and my little sister are getting on."

"In plain speech, you have got a sweetheart—don't deny it."

"I do not deny it, sir," replied Ellen, rather warmly; "we are to be married as soon as he has saved a little money to set up business on his own account."

"Quite right; but my object in putting all these questions to you is simply this: when your sweetheart writes to you, you are not, if you please, to read the letter, but simply to hand it over to me."

Ellen turned crimson. No, she could not do that. She was very sorry to disoblige Sir John, but she could not do that.

"But my dear," he argued, with a smile, "I have not the least wish to read that young man's letter, and as soon as you have handed it to me, I shall give it back to you. I trust you with all my letters: can you not trust me with one of yours now and then?"

Still Ellen demurred. Her letter was her own, and it was plain that Ellen wished to do with her own what she pleased, and be subject to no one's control. But Sir John was firm, or, if you like it, obstinate; and, after some hesitation, and with evident reluctance, Ellen yielded. "Mind, you give me your word to obey me in all these injunctions," said Sir John.

"Yes, sir, I do."

"Well, then, repeat them for me." Ellen did as she was bid, and she went through the series of Sir John Percy's behests with a precision and correctness that pleased him highly.

"The housekeeper shall show you your room," he said, ringing the bell; "and, when you are rested, you can begin your duties."

The housekeeper was a very sour-looking lady, and, having little cause to be pleased with the step Sir John had taken, she treated Ellen with a supercilliousness which the girl had the good sense to ignore. She had come to fill a difficult position, and it was useless to quarrel with its inevitable troubles. Presently she came down in a lilac print dress, with plain white collar and sleeves, looking so trim and neat that Sir John was quite pleased with his new acquisition. He made her sit in the bow-window which commanded a view of the street door; he again rang for Mrs. Long, and requested her to provide Ellen with some darning or mending, or making, as she pleased, and, having seen this order executed, and Ellen's little hand dive into a deep basket and come forth with a pair of his own stockings, he left her, chuckling and rubbing his hands, with a "Now we shall see."

But alas! what was glee and hope to him was darkness and tribulation to Nelly. This gloomy London parlor, looking out on a gloomy London street, filled her heart with desolation. She had parted that morning with the widowed mother; with the little sister, and with the true-hearted fellow who had loved her for years so faithfully—she had left them all for this strange place, and this strange house, and oh! when should she see them again? Not for six months, perhaps; perhaps not for a year. She had done all that for a little money, tempted by Sir John Percy's liberal wages; but it was hard, very hard, and Nelly felt it keenly. But a postman's knock came to the door. Up jumped Nelly, and away flew the dream—lane, lime-tree, nightingale and all. She went and opened it; three letters were put in her hand, and, closing the door carefully, Nelly went up with these letters to Sir John, who happened to be within.

"All right," he said; "but I am afraid it is not all right," he added abruptly. "You have been crying. Have these women already began worrying you?"

Hotspur was up and ready for war, and Nelly hastened to assure him that no one had said a word to her—in fact, that she had not seen a soul since he had left her in the parlor.

"Then what are you crying for?" he asked, looking injured.

"I parted with them all this morning, sir, and this being the first time, and the first day, too, it seems a little hard."

"It is hard," confessed Sir John, "but time will comfort you, or at least enable you to bear it."

In her quiet way, Nelly said she hoped so, and she went back to the parlor and to her darning.

Poor Nelly! she soon had other troubles besides those of separation and remembrance. The housekeeper, the cook, and the housemaid combined to make her life wretched. Mrs. Long found fault with Nelly's sewing, and was bitter on the subject of her darns. The cook said nothing: "Deeds, not words," doubtless was her motto; but she made it a rule to make Nelly eat what she disliked. Nelly hated fat, and Nelly got none but fat meat. Nelly disliked Yorkshire pudding, and Yorkshire pudding became a rule in Sir John's kitchen. The housemaid, too, would not be behindhand. It had been her duty to receive the letters and to attend to the door. Not being now allowed to do the one, she loftily resolved not to do the other. But Nelly, who had been quiet hitherto, and scorned to complain, now rebelled, and showed some spirit. It was contrary to her instructions to open the door to any one save the postman, for he might come whilst she was showing a visitor up-stairs. She laid the case before Sir John. Hotspur flew into a towering passion, and threatened cook, maid, and housekeeper with instant dismissal, if they ever meddled with Ellen again. Nelly had not been loved before, but now she was fairly hated. I fancy hers was no pleasant life, sitting darning stockings in that grim old parlor, taking in letters, and feeling herself detested, in the regions below as well as in the housekeeper's room above. But, if his little maid looked rather pale and melancholy, Sir John was in tip-top spirits; he had not lost a letter, so he said, at least, since he had had Nelly. "The dearest little janitress that ever was," he said, "and true as steel, sir. They laid a plot to get her away from the door, but Nelly came and told me all about it. And I gave them a trimming, sir, by Jove, I did!"

A month and a day had Nelly been with Sir John when the postman gave her a packet of letters one morning. Nelly's heart beat as she looked at them. There was one for her. It had the S—— postmark upon it; besides, Nelly knew the writing. Now, there is a shy, delicate instinct in a girl's love—a feeling that makes her wish to hide what she is not ashamed of. Nelly longed to slip that dear letter into her pocket, and not let Sir John have a look at it. But she remembered her promise, and went up with it as well as the rest. "Oh! one for you," he said, detecting the stiff, round handwriting at once; "there's a good girl, I shall not keep you in pain; go down with it at once." Nell obeyed. She had a warm, impetuous little heart, I suppose, despite her calm face, for she was no sooner out on the staircase than she broke the seal and read her lover's epistle. But alas! no dear, no glad, home fragrance did that little sheet of paper enfold; nothing came out of it but the drearliest and the saddest news. Sir John had not got half through his first letter when the door of his study opened and Nelly broke in upon him, pale, distracted, and her open letter in her hand. "I must go, sir," she cried, "I must go at once. My mother is dying—she is dying, dying."

She seemed beside herself with grief. Sir John took up the letter she had dropped, and glanced over it. Yes, sure enough, Nelly's mother was dying, and asked to see her daughter "once more."

"Of course you must go," he said warmly. "I cannot spare you to-day, but you shall start to-morrow morning."

"To-morrow, sir; will death wait till to-morrow? I must go now—now."

"My dear child, I am to be out all day, and I expect a most important letter, and James, poor fellow, is lying ill in bed, as you know—I cannot spare you to-day."

"Sir John," resolutely said Nelly, "I shall go to-day. I am sorry to disoblige you; but I shall go."

"Hotspur had a great deal to do to keep his temper down," said Sir John, when he told me this, "especially as the little chit's black eyes had just a lurk in them which I remembered rather too well. However, I remained quite cool, and all I said was: 'Well, Nellie, I have servants to obey me, and not to have their own way. I give you a month's warning from this very day.'"

"Very well, sir," composedly replied Nelly. "I am sorry to have annoyed you, but I cannot help it."

Hotspur deigned her no answer, and Nelly went. S—— is within two hours of London by rail. It was three o'clock when Nelly reached it. She had to walk a mile from the station to her mother's cottage. Her road lay along the very lane in which she had wandered with her lover a month back; but how sad and changed was its aspect! Its June beauty was gone. The hot July sun had scorched it. The hedges were white with dust; the trees looked athirst for rain; the sky was grey and lowering, and the beautiful country seemed sad and plague-stricken to poor Ellen. "I felt sure, sir," she said to me later, "that my poor mother was dead."

At length she reached the cottage. Her hand shook as she raised the latch and entered. Her lover was the first person whom she saw. He came forward and comforted her with a word.

"Alive, and better, Nelly."

"Better!" If he had said "cured," Nelly's joy could scarcely have been greater. She cried, she laughed, she kissed her little sister, her mother, her lover, Mrs. Doring, a kind neighbor who had come in to nurse the sick woman. She could have kissed the ground in the gladness of her heart. Yes, the poor woman who had been dying the day before was better now, and, what was more, the doctor felt sure, from the turn her complaint had taken, that she would live. This glad news Nelly's lover gave her outside the cottage door, for the invalid was too low to bear much.—[Conclusion next week.

*This story was found amongst the MSS. of the lamented Miss Kavanagh. Other MSS. were also found by Mrs. Kavanagh, but in too incomplete a form to admit of their being published.

BEWARE OF LIGHTNING.

How to avoid Danger during a Thunder Storm.

UNDER what conditions is damage from lightning possible? and what are the means by which the risk may be lessened or avoided? An isolated tree, standing either upon a wide plain or upon an eminence, is obviously likely to determine a lightning discharge, to "attract the lightning," to use a common expression. The top of the tree is the nearest point to the cloud, and since the tree is a better conductor than the air, a line drawn vertically through it to the cloud marks the shortest and easiest course along which the electricities may pass. If, when the charged cloud arrives directly over this point, the tension is sufficient to overcome the resistance along that line, a discharge will take place, and the tree will be struck. But if the tension be not sufficient, the cloud will pass harmlessly over. Hence it appears that a person standing during a thunder storm beneath a tree so situated, is exposed to some risk. On no account, therefore, should a traveler take refuge under an isolated tree; generally he will do well to avoid its neighborhood altogether; but should he be overtaken by the storm when on a plain with no shelter near, the tree may still be made to afford him some protection. If he take up a position near it, but not under its branchess, he will probably escape unhurt, should the lightning descend upon it.

The safest distance from the tree is that which is equal to its hight. To approach much nearer than this is to incur the risk of being within the influence of the stroke; to remain at a much greater distance away is to place one's-self in the same condition of isolation as the tree itself. It will have been remarked by all the observers of the phenomenon that whenever a tree has been struck by lightning, it has generally occupied an isolated position. In describing the position as one of isolation, however, it is not meant that the tree is necessarily standing alone, but that it is not one of a numerous group. When there are many trees together their collective conductivity is often sufficient to cause an indestructive discharge of electricity. This is especially likely to happen when the trees are wet with rain, for then their surfaces are covered with a film of water, which is a good conductor. For this reason, the danger from lightning is much less after a rain has begun to fall than before, when everything is dry. It appears, therefore that the safest situation during a thunder storm is in the midst of a wood, particularly if the neighborhood of the tallest trees be avoided. In such a shelter, the traveler may take refuge in full assurance that he will there be effectually shielded from harm. The greatest risk of injury from lightning is undoubtedly incurred by persons traveling across a wide and very flat plain, be-

cause in such a situation they are the only elevated objects. To lessen the risk, which may here be somewhat serious, advantage should be taken of whatever undulations of surface may exist, to keep upon the lowest ground. No doubt the prostrate position would in these circumstances afford greater security than the erect. It happens not unfrequently that animals are killed by lightning under a tree to which they have betaken themselves for shelter. In these cases the tree is struck partly on account of its isolation, and partly on account of the presence of the animals beneath it.

Usually there are several, and often many of them assemble together, huddled probably by terror into contact one with another. The air, heated by their bodies, rises above them laden with moisture, derived mainly from their breath. Who has not noticed the cloud of vapor that in the early morning and in certain states of the weather hangs over a flock of sheep or a herd of kine? The column of moist air ascending through the branches of the trees toward the cloud offers, in consequence of the comparatively high conductivity of water, a favorable passage for the electricity. A herd of cattle under an isolated tree is thus exposed to a double risk; also it is evident that these animals are in the open country less secure from injury than human beings, who cannot affect the atmosphere in a like degree.—*Chamber's Journal.*

GOOD CONVERSATION.

THE Christian gentleman studies and practices such rules of the Bible, the best hand-book in the world on the art of conversation, as the following: "Let your speech be always with grace, seasoned with salt, that you may know how you ought to answer every man." "Let no corrupt communication proceed out of your mouth, but that which is good to the use of edifying." "Speak evil of no man." "Putting away lying, speak every man truth to his neighbor." "A word fitly spoken is like apples of gold in pictures of silver."

He despises gossip and hates slander. He would no sooner talk about your private affairs with others than he would steal your purse or peep through your key-hole; and he considers slander the most heinous of crimes.

His conversation is marked by its purity. He tells no story and utters no word that he would blush to have understood by the most chaste and refined woman.

He deems it ungentlemanly, as well as wicked, to emphasize his conversation with profane oaths. He respects the feelings of others too much to speak lightly of Him whom the Christian loves better than the dearest earthly friend.

He speaks his native language in its purity. He avoids slang. It matters little how well a man may be dressed, how elegant his manners or accomplished he may be in the classics and foreign languages, if he does not speak his mother tongue in its purity, he cannot be received as a perfect gentleman. False syntax, mixed idioms, the prostitution of sublime words to mean uses, slang phrases, betray want of culture and vulgarity in spite of all disguises. They frequently indicate a want of moral character. He who prefers a smattering of French to the mastery of his own language, must care more for show than for true worth. He who corrupts in the using the magnificent language which has been entrusted to him as a rich legacy for posterity, is not fit, it would seem, for places of high trust. The vocabulary and phrases of a man afford a fair estimate of his culture and character. Words are the balances by which we are weighed. "By thy *words*," says Jesus Christ, "shalt thou be justified, and by thy words shalt thou be condemned."

The conversation of the Christian gentleman is truthful. He never utters a falsehood for any purpose. He would not lie to escape from any difficulty or to secure any reward. Moreover, he avoids exaggeration and careless errors. Speaking always with authority, his declarations may ever be relied upon with safety.

He never descends to angry disputation. He is not one of those who are forever arguing. He is not an egotist who disputes on politics or religion to show that "e'en though vanquished he could argue still." He has opinions and is able at a fitting time to give his reasons; but he never descends into the arena to make a show of his controversial powers. He is free also from dogmatism, which mars the character of so many men of talent, never attempting to force his opinions upon any who will not gladly accept them. Neither is he a pedant who talks incessantly that he may overpower you with a sense of his musty learning. Nor has he a hobby which he is forever trying to make you ride behind him to the death. Nor does he insult your self-respect by descending to commonplace bandying of words and compliments, chatting nonsense, as if such food only were suited to your effeminate soul.

His talk is at once entertaining and instructive. With no assumption of airs, he teaches you as though he taught you not. He interests himself in those things which interest you. He discovers your best thoughts and gives to them a beautiful expression. He gives you the facts for which you have been in search. He tells you the news you delight to hear. He excites those emotions of your heart that please you, and then shares your enjoyment. If perchance he strikes a tender chord that reminds you of your grief, he heals the wound with genuine sympathy. He strengthens your good resolutions with new motives that you had not discovered. Avoiding base ridicule and biting sarcasm, he cheers you with his genial humor and banishes gloom with his sparkling wit.

Master of the art of conversation, he does not suffer the time to run to waste in awkward silence or vain words. He chooses the themes and talks with a purpose. He is as good a listener as he is a talker. He listens with such attentive interest that he makes the most reticent speak. In being a good listener, in knowing when to keep silent and how to draw out from others their best thoughts, consists half or more than half the art of successful conversation.

Such a Christian gentleman is welcome wherever he goes; for, at the head of the table or in the center of the drawing-room, he is the life of the company and the joy of the social circle.—*Sunday Afternoon.*

RECENT LITERATURE.

Words: Their Use and Abuse. By Prof. WILLIAM MATTHEWS, L.L.D. Published by Griggs & Co., Chicago, Ill.

THOSE who imagine this to be a dry dissertation on philology need read but a half dozen pages to convince themselves that the author has succeeded in writing a really fascinating book. Even those for whom the subject has no special attraction cannot fail to become very much interested in Prof. Matthews' work; and we cordially commend it to all who desire to learn how to express themselves with accuracy and elegance. We give a few extracts from this book, hoping thereby to awaken an interest among our readers in the subject of words, and to induce them, if possible, to study the significance and correct use of these "expressions of ideas." If one-half the time and money now expended in giving young people a smattering of modern foreign languages were devoted to training them to a thorough knowledge of their native tongue, one would not so often be amazed and disgusted at the ignorance of the correct use of even simple words and phrases displayed by many who pride themselves on being "educated."

We proceed to notice some of the common improprieties of speech. Many of them are of recent origin, others are old offenders that have been tried and condemned at the bar of criticism again and again:—

But, for that, or if. Example: "I have no doubt but he will come to-night." "I should not wonder but that was the case."

Agriculturalist, for agriculturist, is an impropriety of the grossest sort. Nine-tenths of our writers on agriculture use the former expression. They might as well say geologicalist, instead of geologist, or chemicalist, instead of chemist.

Illy is a barbarism, quite common in these days, especially with newly-fledged poets. There is no such word as illy in the language, and it is very silly to use it. The noun, adjective, and adverb, are ill.

Plenty, for plentiful. Stump politicians tell us that the adoption of a certain measure "will make money plenty in every man's pocket."

I have got, for I have. Hardly any other word in the language is so abused as the word get. A man says, "I have got a cold;" he means simply, "I have a cold."

Differ with, is often used, in public debate, instead of differ from. Example: "I differ with the learned gentleman, entirely,"—which is intended to mean, that the speaker holds views different from those of the gentleman; not that he agrees with the gentleman in differing from the views of a third person. Different to is often spoken and written in England, and occasionally in this country, instead of different from. An example of this occurs in Queen Victoria's book, edited by Mr. Helps.

Corporeal, for corporal, is a gross vulgarism, the use of which at this day should almost subject an educated man to the kind of punishment which the latter adjective designates. Corporeal means, having a body corporal, or belonging to a body.

Wearies, for is wearied. Example: "The reader soon wearies of such stuff."

Anyhow is an exceedingly vulgar phrase.

Lie, lay. Gross blunders are committed in the use of these words; e. g., "He laid down on the grass," instead of "he laid himself down," or, "he lay down." The verb to lie (to be in a horizontal position) is lay in the preterite. The book does not lay on the table; it lies there. Some years ago an old lady consulted an eccentric Boston physician, and, in describing her disease, said: "The trouble, Doctor, is that I can neither lay nor set." Then, Madam," was the reply, "I would respectfully suggest the propriety of roosting."

"Like I did," is a gross Western and Southern vulgarism for "as I did."

Less, for fewer. "Not less than fifty persons." Less relates to quantity; fewer, to number.

Balance, for remainder. "I'll take the balance of the goods."

Revolt, for are revolting to. "Such doctrines revolt us."

Likewise, for also. Also classes together things or qualities, whilst likewise couples actions or states of being. "He did it likewise," means he did in like manner.

Avocation, for vocation, or calling. A man's avocations are those pursuits or amusements which engage his attention when he is "called away from" his regular business or profession,—as music, fishing, boating.

Crushed out, for crushed. "The rebellion has been crushed out." Why out, rather than in? If you tread on a worm, you simply crush him,—that is all.

Of, for from. Example: "Received of John Smith fifty dollars." Usage, perhaps, sanctions this.

Had ought, had better, had rather. All these expressions are absurdities, not less gross than hisn, tother, hain't, theirn. No doubt there is plenty of good authority for had better and had rather; but how can future action be expressed by a verb that signifies past and completed possession?

At, for by. E. g., "Sales at auction." The word auction signifies a manner of sale; and this signification seems to require the preposition by.

Party, for a man or woman. This error, so common in England, is becoming more and more prevalent here. An English witness once testified that he saw "a short party" (meaning person) "go over the bridge." Another Englishman, who had looked at a portrait of St. Paul in a gallery at Florence, being asked his opinion of the picture, said that he thought "the party was very well executed." It is hardly necessary to say that it takes several persons to make a party.

Deceiving, for trying to deceive. E. g., a person says to another, "You are deceiving me," when he means exactly the opposite, namely, "You are trying to deceive me, but you cannot succeed, for your trickery is transparent."

The masses, for the people generally. "The masses must be educated." The masses of what?

In our midst. This vulgarism is continually heard in prayer-meetings, and from the lips of Doctors of Divinity, though its incorrectness has been exposed again and again. The possession or appurtenance. "The midst" of a company or society is not a thing belonging or appurtenant to the company, or to the individuals composing it. It is a mere term of relation of an adverbial, not of a substantive character, and is an intensified form of expression for among. Would any one say, "In our middle?"

Excessively, for exceedingly. Ladies often complain that the weather is "excessively hot," thereby implying that they do not object to the heat, but only to the excess of heat. They mean simply that the weather is very hot.

Either is applicable only to two objects; and the same remark is true of neither and both. "Either of the three" is wrong; so is this,—"Ten burglars broke into the house, but neither of them could be recognized." Either is sometimes improperly used for each; e. g., "On either side of the river was the tree of life."—Rev. xxi. 2.

Seldom or never is a common vulgarism. Say, "seldom, if ever."

Conduct. In conversation, this verb is frequently used without the personal pronoun; as, "he conducts well," for "he conducts himself well."

Least, for less. "Of two evils, choose the least."

A confirmed invalid. Can weakness be strong? If not, how can a man be a confirmed, or strengthened, invalid?

Previous, for previously. "Previous to my leaving America."

Appreciates, for rises in value. "Gold appreciated yesterday."

Proven for proved, and plead for pleaded, are clearly vulgarisms.

Bound, for ready or determined. "I am bound to do it." We may say properly that a ship is "bound to Liverpool;" the term is strictly a nautical one.

Such for so. E. g., "I never saw such a high spire." This means, "I never saw a high spire of such a form," or "of such architecture;" whereas the speaker, in all probability, means only that he never saw so high a spire.

How for that. "I have heard how some critics have been pacified with claret and a supper."

Equally as well, for equally well. E. g., "It will do equally as well."

Looks beautifully. No cultivated person would say, "she is beautifully," or "she seems beautifully," yet these phrases are no more improper than "she looks beautifully." We qualify what a person does by an adverb; what a person is, or seems to be, by an adjective; e. g., "she looks coldly on him;" "she looks cold."

Leave, as an intransitive verb. E. g., "He left yesterday." Many persons who use this phrase are mislead by what they deem the analogous expressions, to write, to read. These verbs express an occupation, as truly as to run, to walk, to stand. In answer to the question, "What is A. B. doing?" it is sufficient to say, "He is reading." Here a complete idea is conveyed, which is not true of the phrase, "He left yesterday."

First Principles of Agriculture. By HENRY TURNER, F. C. S. New York: Macmillan & Co.

THIS is a concise, clear, practical hand-book of the science of Agriculture; just such a book as should be in the hands of all farmers. It explains those subjects that it is usually taken for granted every one interested in the subject knows all about, but who, if compelled to give a succinct account of the formation of soils, for instance, would display a wealth of ignorance, out of proportion even to the assumed knowledge of the subject. Technical terms are avoided as much as possible. A few of the topics treated will give us an idea of the contents of the book. The Soil, Composition of Crops, Farm Manures, Natural and Artificial Manures, Rotation of Crops, Food of Farm Stock, etc. It is the best elementary book on the subject we have seen.

MAGAZINE NOTES.

THE September Atlantic opens with a poem by Whittier, The Vision of Echard, which is supplemented by three poems of minor bards, and The Silent Melody, by O. W. Holmes. J. W. Kearney contributes American Finances from 1789 to 1835, and Mr. Sedgwick explains Primitive Communism. Francis J. Lippitt has an able article on Pope's Virginia Campaign, and Porter's Part In It, which shows very clearly that Porter sustained a soldier's part and acted with more judgment than was displayed by the commanding general. Count Shouvaloff is the subject of an admiring article by Axel Gustafson, and Mr. Perry criticises some French novels. The Europeans is continued, and the commencement of a new serial, A House of Entertainment, by H. E. Scudder is very promising. Richard Grant White has his fourth article on Americanisms, and the Contributor's Club is as full of color as Jacob's coat.

HARPER'S MAGAZINE for September, with the two serial stories by Black and Hardy; three brilliant short stories by Mrs. E. W. Latimer, Rebecca Harding Davis and Rose Terry Cooke; a dramatic sketch of thrilling interest by T. B Aldrich, with three admirable illustrations by Abbey; a humorous sketch by Charles D. Deshler, entitled Ab'm: A Glimpse of Modern Dixie, illustrated by Pyle; an illustrated poem, of pathetic interest, The Foreclosure of the Mortgage, by Mrs. E. T. Corbett; other poems by Ruth Dana and Harriet Prescott Spofford; several illustrated articles, covering a variety of subjects; timely articles of great and immediate interest to all readers, and the five admirably sustained editorial departments—is an exceedingly rich, beautiful and entertaining number.

SCRIBNER for September opens with an engraving by Cole of Mr. W. M. Chase's painting, Ready for the Ride, recently exhibited in New York. The leading illustrated paper is entitled Hunting the Mule-Deer in Colorado, by Mr. J. Harrison Mills, who appears in the treble capacity of writer, wood-draughtsman and engraver. There are also drawings by George Inness, Jr., W. M. Cary and Frederick Dielman.

Dr. William J. Morton follows up his paper in the August number, entitled To South Africa for Diamonds! with a second and concluding installment of personal experience at "the diggins," chiefly about the Cape diamond, diamond buying and stealing, incidents and life in Kimberley, the morning markets, etc. Among the illustrations are views of the Dudley and Stewart diamonds in their settings. Maurice Thompson, of archery fame, has a paper on Glimpses of Western Farm Life, and introducing a novel first experiment in illustration, viz.: an engraving of a sketch in clay for a medallion of American farm life, modelled for the article by Mr. C. L. Warner, the sculptor. Following appropriately is a discussion by Stephen D. Dillaye of The Transportation Question, in advocacy of a narrow-gauge "pure freight" highway, organized and controlled by the government. The manufacture of A Spool of Thread, is described by Charles H. Clark. Mrs. Burnett's new story, Haworth's, will begin in November.

LITTELL'S LIVING AGE.—The number of Littell's Living Age for the weeks ending August 3d and 10th have the following valuable contents: Giordano Bruno and Galileo Galilei, Quarterly Review; Among the Burmese, Fraser; What the Sun is Made of, by J. Norman Lockyer, Nineteenth Century; A Doubting Heart, a serial story by the author of Castle Day, published from advance sheets; Cheap Literature for Village Children, Macmillan; American Misions in Turkey, Frazer; The Story of a Letter, by Julia Kavanagh, Argosy; The Constitution of Norway, Fraser; Stray Thoughts on Scenery, Cornhill; The Bishops at Lambeth, Saturday Review; Our Kentish Parish, Blackwood; How Three Princesses Purchased a Palace, Pall Mall Gazette; Admiral Sir George Black, Nature; The Will of Peter the Great, Academy; and the usual choice poetry etc.

For fifty two such numbers, of sixty-four large, pages each (or more than 3000 pages a year), the subscription price ($8) is low; or for $10.50 any one of the American $4 monthlies or weeklies is sent with The Living Age for a year, both postpaid. Littell & Gay, Boston, are the publishers.

THOSE who enjoyed the expression of Anna C. Garlin's views on church-fairs, in SUNDAY AFTERNOON, a month or two since, can learn much that is interesting from her about Mothers' Meeting in the September number of the above-mentioned magazine. What this bright, suggestive writer has to say ought to be read by all women who are interested in church work. For the rest the magazine contains Chrysanthem, a tale by Lizzie M. Champney, in which spiritualism is treated of. The Testimony of the Spirit, by Geo. Fisher; Dandelion Ghosts, by Elizabeth Akers Allen; Religion in College, by C. F. Thwing; Philanthrophy at Pitch Point, by L. K. Black; Embalmed, by Susan Coolidge; Chips from a Northwestern Log, III., by Campbell Wheaton; Religious Rights of Christian States, by Charles H. Richards; Aunt Huldahs' Scholars, by Edw. E. Hale; Quietness, by Julia Dorr; Martha Pitkin and Ursula Wolcott, by Henry Goddard; Judith and Judah, by Josephine R. Baker; A Water Lilly, by M. Y. Butts; After a Puck, by M. Louisa Pool; Good Conversation, by C. S. Walker, and the Editor's Table, where the Nobility of Labor, A Burning Question, Another Heresy, A Happy Sunday, and Notes on Current Events are discussed.

AN exceedingly fine steel engraving of Henry M. Stanley, of African fame, adorns the title page of the ECLECTIC MAGAZINE for September and the short biographical sketch which follows, adds to the interest one feels in this intrepid explorer. This number of the Eclectic embraces a wide range of subjects and some of the best foreign periodicals have been laid under contribution. The result is a most entertaining and instructive number. We give table of contents.

Life and Times of Jas. Madison, The Mystery of Edwin Drood, Lady Caroline Lamb, Freemasonry: Its History and Aims, Lower Life in the Tropics, Johnson without Boswell, What the Sun is made of, Stray Thoughts on Scenery, An instalment of Macleod of Dare, Posting and Post-offices of China, The Earth's Place in Nature, Through the Dark Continent, Italia and Literary Notices, Science and art—this latter department is a most useful one, and reflects great credit on the editor.

APPLETON'S opens with an illustrated article on the New York Post-office, by L. P. Richardson, which is followed by In Paraguay, by J. J. Platt. Will. Wallace Harney sings about The Old Home, and Barton Grey tells in tuneful numbers What may Happen at Your Gate. Mr. Wm. Minturn writes pleasantly of Ed. Manet. There are three pleasant stories in this number, two of them continued. For the price, three dollars per year, Appleton's furnishes very choice reading.

LIPPINCOTT'S MAGAZINE for September contains articles by Ellen W. Olney, Louise Chandler Moulton, Rebecca Harding Davis and Mary Dean, beside interesting contributions in prose and in verse from writers who are not so well known. Is it necessary to add, after enumerating such a galaxy of brilliant authors, that this number of the magazine is delightfully interesting?

BRIC-A-BRAC.

CHRISTIAN RULES FOR SUNDAY.

Dress hard all morning, such is fate,
Then enter church some minutes late.

All eyes will then be turned on you,
And will observe your bonnet new.

Let humble modesty wreathe your face,
And take your seat with faultless grace.

Let all your thoughts be fixed on high,
And rearrange your cardinal tie.

Think how religion's prone to bless,
And criticise your neighbor's dress.

Let all your heart be filled with praise,
And notice Mrs. Miggle's lace.

Put from your mind all thoughts of sin,
And readjust your diamond pin.

Think of how good religion proves,
And then smooth out your buttoned gloves.

Catch well the precepts as they fall,
And smooth the wrinkles in your shawl.

Think of the sinner's fearful fate,
And notice if your bonnet's straight.

Pray for the influence of divine—
That lady's basque, mark the design.

Let tender peace possess your mind,
And criticise that hat behind.

Reflect on Christian graces dear,
And fix those curls beside your ear.

Let your heart warm with silent prayer,
And view that horrid green silk there.

Reflect upon the wickeds' ways,
See if your gold chain's out of place.

Think of the peace the good shall find,
And wonder who are sitting behind.

Think of the burdens Christians bear,
And notice these strange ladies there.

The last words hear with contrite heart,
And fix your pull-back when you start.

[*Springfield Republican.*

HE SWALLOWED A TORPEDO!

It happened to the subscriber. I am a man-nurse at Bellevue Hospital. It is my duty to smother patients that don't seem likely to get better when their beds are wanted. I perform this nefarious act in the silence of midnight, my sole weapon, a hospital pillow. It's the regular thing up there, you know.

Well, one night when we were full there was a call for a bed, and I was about to create the accommodation, when I felt a hand from behind placed upon my shoulder. It was the nurse, Mary Ann. "Don't," she said, "it's dangerous. Follow me; I have something to say." I followed to a distant corner of the hall. There, her left hand toying idly with a medicine phial—she spoke in this strain: "He was in love with me once, and I don't want him silenced; besides, he has a mission to accomplish, and he'll get better." "What is it?" I asked. She drew me closer into the shadow of the wall, and whispered, "He has a torpedo in his inside!" "Impossible!" I gasped, preparing to dive under a cot. "Yes, but don't be alarmed; it is one of his own invention. It is no larger than a pill, and he swallowed it by mistake. It has made him very sick, but so long as he lives it will remain intact, unless, peradventure, he is subjected to violence, when it will explode!!"

"Aha! Then he musn't die here." "Of course not. That is why I cautioned you. To-morrow he will be taken carefully home to his mother-in-law's. There he proposes to manufacture these torpedo-pills by the gross. They will regenerate society. Husbands will be able to live at peace, and go to the lodge as often as convenient without fear of consequences. No man will dare to beat his wife, for fear of exploding her torpedo. Policemen will use the club with great caution, and not without previous inquiry. Ward primaries will fade into the dim past. War will be impossible; the killing of the enemy's soldiers, will be the destruction of your own troops. No stage-driver will dare to run down helpless pedestrians, because the torpedo-pill will be harmless during an unmolested life and a quiet death, but infernally deadly the instant violence is attempted. It is to be sold to editors at half——oh! what was that?"

Terrified, I listened. There was a hissing sound issuing from his bed, and then—then a loud report. The building quivered, the walls tottered, and the roof went soaring into space.

THE MAN WITH THE TORPEDO HAD GONE OFF!

* * * * * * *

I don't know how I escaped. When I awoke to consciousness I was lying against a lamp-post at the corner of Third avenue and 125th street. I have thought it over since, and concluded he must have hit himself, accidentally, in the chest. His loss can never be compensated for; no one possesses the secret of those pills. 7 x 9.

"OH, WHAT SHALL THE HARVEST BE?"

WITH VARIATIONS.

The farmer looks over his broad field of hay,
Rejoicing its progress to see,
And gleefully chants the appropriate lay,
"Oh, what shall the harvest be?"

The horse doctor comes on his horse to attend,
And finds a big lump on his knee;
He remarks, as he strives the excrescence to end,
"A wart shall the harvest be."

The thief plies his art in some crowded resort,
With the contents of pockets makes free,
Says in clutching a time-piece of elegant sort,
"A watch shall the harvest be."

The ascetic in search of a garment hirsute
(To atone for his sins seeketh he),
Exclaims as he starts on the pious pursuit,
"Oh, what shall the ha'r-vest be?"

[*Phillips Thompson, in St. John Torch.*

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

AUGUST DAYS.

"Now, what hath entered my loved woods
And touched their green with sudden change?
What is this last of nature's moods
That makes the roadside look so strange?
Who blanched my thistle's blushing face,
And gave the winds her silver hair?
Set golden rod within her place,
And scattered asters everywhere?"

So through my brain and in my heart these thoughts will come—of regret for Summer going, and I murmur as I sing—

"Return darling lilies and white roses,
And bring back the summer days again."

All too fleeting seemed the bright June days—too swiftly passed the rich-fruited July. August will soon wane, and everywhere there is a *stillness*, as of work done. Nothing speaks of Autumn—the harvest's fullness is with us, but we catch a glimpse of change in the tint of the leaves, the cry of the grasshopper, and the fields bereft of the yellow grain. Ah! me, only too soon the chill breath of Autumn will touch the leaves of our tenderest blossoms—we shall awake some morning to find a suspicious breath, as of a heavy mist, upon the window pane, and feel sure of frost—perhaps slight at first, but warning us of the season's change. Let us not anticipate, but while we may, we can enjoy the full fruition, the perfection and richness of the latter summer days.

ANNIE L. JACK.

LETTERS FROM A COUNTRY GIRL.—No. 6.

MARGARET B. HARVEY.

I HAVE said, I think, that I hoped to be able to point out several ways in which our countrywomen (and all women) may improve their minds. I still cherish the hope. For this season of the year, I think one of the most effective, most delightful, most satisfactory and least difficult means, would be to commence the study of Botany, or continue it, if it has been taken up.

The books recommended in a former letter were Mrs. Lincoln's (latest edition) and Gray's. The first contains a very thorough exposition of the principles of Vegetable Anatomy and Physiology, and descriptions of very many of our indigenous and exotic plants It is reliable in all particulars except Ferns, whose nomenclature has changed very much within the last few years. Gray's botanical books are from the pen of Prof. Asa Gray, of Harvard. Prof. Gray is *the* authority for North American plants. Of his several text-books of vegetable science, "How Plants Grow," in conjunction with, and followed by, "Gray's Manual," or, "Field, Forest and Garden Botany," will be best.

I fancy I hear some one say, "*Why* need a woman in a farm-house study botany, and *when* could she?" I shall try to answer these questions before going on to advise farther in its pursuit.

The first might be disposed of under the general assertion that knowledge brings its own reward. But I shall add that, surrounded as such a woman is by tall trees, bright flowers, luxuriant vines, fine vegetables, luscious fruits, waving grasses and velvet mosses, benefited constantly by their convenience and their beauty, it seems most natural, most appropriate for her to study as extensively, as intelligently as possible, objects so near and so useful to her. It is always best for us to know most of what pertains to our own domain.

The second is not very hard to answer. A little occasional reading, a paragraph now and a page then, in the little scraps of time, if accompanied by an earnest desire and supplemented by a pair of quick eyes, will accomplish wonders.

For instance, a woman sits shelling beans. She has that morning in the interval between ringing the breakfast bell and waiting for the appearance of the family, peeped into her Botany long enough to see that a *legume* is a pod with two sutures, having the seeds fastened to one, and opening by the other,—practice has long ago told her which. Now, as she sits there, a sudden charm is lent to the otherwise monotonous work, as she remembers that it is a *legume* she is breaking with her fingers. What other plants have legumes? Peas, sweet-peas, string-beans,—all varieties of beans, in fact. Here is an idea. If they are alike in the character of their fruit, is there any other likeness? Yes; all have flowers similarly shaped. (She *knows* the appearance, though as yet she is unable to describe it. She will afterwards learn that it is a *papilionaceous* corolla, or one having a *keel*, a *banner*, *wings*, and *diadelphous stamens*.) What other plants have like flowers? The wistaria, the acacia, the locust, the lupine, the judas-tree and the amphicarpa. So her mind runs on, as she recalls the form of one, the color of another, the size, perfume, fruit, etc., of still another and another, until she becomes conscious that there is in the vegetable kingdom a series of links and likenesses which she had not before taken into consideration. And in the quiet afternoon, when the work is all done up, she again turns to her book, and to her great joy, her sudden elevation and her eternal benefit, she finds that she has, almost unconsciously, learned the leading characteristics of the family *Leguminosæ*.

With what rapid wings will she travel for a time after this, and so naturally too. Among her rare currant and gooseberry bushes, will she not discover that there is a family, *Ribes*, even before she knows the name? In her flower-beds and orchards, will not her roses and apples and raspberries and pears, point her to the *Rosaceæ*? Can she not see in the gay hollyhock on the lawns, the althæa down the lane, the okra in the truck-patch, and the "cheesewally" in the neglected walk, the Malvraceæ? Believe me, yes.

And I venture to say she will not rest satisfied here. She will want to analyze separate specimens, and determine their family, genus and species. And if ever she is going to be discouraged, it is now. But with patience, perseverance, and a good pocket-lens ($1.25) she can accomplish much, with far less trouble and vexation than her mother and grandmother experienced in working the rectangular Adam and the paper circular Eve, or the cadaverous Moses and the spectacular Aaron, on the faded samplers in the garret, along with the relics of departed days and glories. And if at the end of summer and autumn she has carefully studied twenty specimens, dried them flatly, neatly gummed them into a blank book, and by them written their correct *genera*, *species*, *families* and *common names*, together with the date and locality of gathering, so as to have made a commencement for a herbarium, she will have done very well. And it is safe to say that from no other portion of her summer's work and enjoyment, will she have derived very much more real profit and pure sale.

ENGLISH COUNTRY HOMES.

E. F. M.

THE first thing which impresses an American in traveling in England, and visiting her country houses and cottages, is their substantial strength and age. Many of the manor-houses were built under the Tudors, and the walls of gray stone, or red brick, are massive and thick. At once you feel how thoroughly English is the beautiful word "home;" how truly it fits such a house where generation after generation were born and wedded, and from which they have been slowly borne to their last resting-place. These dwellings are full of stories and traditions, and seem thoroughly infused with human life and interests.

Another striking characteristic, which springs from the certainty that these houses are built for centuries and are strong to withstand the destructive influences of time and climate, is the rich and ornate style of architecture. The workman loved his work and expected it to endure. So you will see oriel and dormer windows, or gable ends and cornice, and frieze, and stairways, rich with heavily carved work in wood. There are stone-shafted casements, delicate traceries, lattice-worked windows with small diamond-shaped panes, portals of stone carved with armorial bearings. Even the massive oaken doors are carved in quaint devices of fruits, flowers and birds, with grotesque faces mixed with these.

The halls have immense open fire-places, in which whole logs used to blaze in cheerful flames at merry Christmas tide. In the long picture-galleries you may see with interest the types of countenance characteristic of different periods, and the quaint changes, not only in costume, but attitude, manner and expression, the stateliness of old days merging into the simplicity and directness of to-day.

The English are by nature so conservative, so fond of ancient things, that you may mark in their homes all the phases of change, from a distant period, in both building and gardening—although landscape gardening was introduced in the reign of William and Mary. In our country every vestige of the old style would long ago have been effaced, but in some old country houses you may look from a jutting bow-window, completely overrun with ivy, upon grounds laid in the old formal manner—clipped shrubberies, evergreens cut in queer shapes of peacocks, swans or animals; raised terraces, and heavy stone balustrades ornamented with urns or leaden statutes. But nothing can be lovelier after leaving these trim, precise gardens of old-fashioned tastes, than to wander in an English park, where nature's own requisite forms and combinations are carefully preserved. The cool green sward of wide lawns is shaded here and there by groups of stately trees. There are woodland glades, across which troop the silent herds of deer, and in the glens you hear the whir of the startled pheasant, or see the hare scurrying away to her hiding-place. The brook winds athwart the valley, now stretching into a small lake, now gliding into a quiet pool, which reflects the shining tree-boughs, and holds the shy trout safe in its shadowed recesses.

Our own Washington Irving speaks with enthusiasm of such gardening on a smaller scale. He says the most sterile and unpromising spot may be changed into beauty. "The cherishing and training of some trees; the cautious pruning of others; the nice distribution of flowers and plants of tender and graceful foliage; the introduction of a green slope of velvet turf; the partial opening to a peep of blue distance, or silver gleam of water; all these are managed with a delicate tact, a pervading yet quiet assiduity, like the magic touchings with which a painter finishes up a favorite picture." One slight difference in the management of chimneys adds to the picturesqueness of an English house. Rising over the rich masses of foliage, instead of one stiff and awkward chimney you will see a cluster of chimneys, ornamented with mouldings of brick work, an ornament rich and full of character, adding greatly to the general outline of the building, as well as to the comfort of the interior life.

Another thing that one soon learns to love in English farms is the green hedge-row that divides one field from another. These hedges are fragrant with flowers in summer and full of berries in autumn, and furnish homes for thousands of twittering, happy birds, which weave their nests in these green nooks and find protection here from predatory birds. A well-trodden path leads you through the quiet fields to the village church, where the dwellers in such houses, and the tillers of the lands, have worshipped under the same roof from youth to age. Many of these old churches are completely covered with ivy from the turret and tower to the base, and the jutting buttress or fantastically carved ornaments peer out through the rich green tapestry of close leaves. You walk between the graves to the very church doors, and the tablets on the walls bear the memorial stories of the departed.

Nor are you out of reach of such influences and associations when you leave the church walls. Even at a distance you may see the old tower,

"Which lifts the soul up silently
To Heaven, with all its dreams,"

and hear floating through the evening air the sweet, clear notes of the birds. It is no wonder, that a country so beautiful, and so rich in human memories, so strong in its ties of household affection and faith, should be dearly loved by her children, for even a stranger soon regards it with warmth, which no other foreign land can awaken.

TAKE A SEAT.

J. E. M'C.

IT is a motto of the Cary Indian that "it is ter to walk than to run, it is better to stand than to walk, it is better to sit than to stand, it is better to lie than to sit." Without taking it quite so far, I would urge every housekeeper never to stand about her work when she can sit. There is no danger but what she will get sufficient exercise, in any case, and the relief and rest she will find in often sitting down when she has a pan of potatoes to pare, or a dish of berries to hull, or a hundred other small matters to attend to, can not be computed until the days' work is done, and she sees the comparative comfort with which she has been able to perform her work.

Some very delicate ladies are able to carry on the affairs of a household with a very small outlay of strength by using great system and care in this respect, and the strongest-armed woman has need to husband her strength as she goes along, for she will need it all before her life-work is done. To make work easy when sitting down, a variety of seats are needful, placed in convenient corners, for if one must go out into another room to look for the right kind of a chair, the chances are that the work will be done standing.

A low seat made of a box, well-cushioned and simply covered is handy for a great many things. A low rocker, by a pleasant window, is a real bower of ease where a tired mother may catch many a little breathing space, and have for a few minutes an out-look that shall make her spirits brighter as she goes back to her work.

But a high stool, like an office chair, should form a part of every kitchen outfit, seated on it, one may wash dishes, fold and iron clothes, and do many things that most women suppose must be performed standing. A hundred women would be glad to make this change in their way of working if it was not for that great bug-bear "what will people say?" They have strength to drag about their work after a fashion, but they have not moral strength to stand up to that. A little tonic for the moral is what a great many women need. You must harden yourself to that carping, cynical Mrs. Grundy's talk, and go serenely on your way, when you are convinced it is the right way. A cheery, independent manner, disarms criticism and often brings the critic around to your way of thinking. Always yielding and always, in a manner, trembling for fear other folks won't like it, makes you a weary slave. You cannot wisely despise public opinion, or run against it determinately; but you may bend and mold it to your own service, and with lasting benefit to others as well as yourself.

WOMAN AS A PIANOFORTE TUNER.—Can any reasonable objection be advanced to the employment of women as pianoforte tuners? The present writer is totally ignorant of music, and therefore may have erroneous notions respecting the scientific acquirements necessary for the exercise of the tuner's art; but whatever these may be, is it proved that women cannot attain to them? If the tuner needs only a true ear for harmony, mechanical facility in handling the implements of his craft, and a knowledge of the construction and capacities of the various instruments on which he may be required to exercise it, there can be no doubt that women are as well qualified by nature as men to be pianoforte tuners. The true ear for harmony is the test requirement, and as many women as men possess that. The occupation is not fatiguing, and it is one that, like the cleaning, repairing and regulating of clocks and watches, might be secured to numbers of properly taught and qualified women, if the ladies who are interested in extending the area of employment for their own sex would commence the movement in favor of it. It cannot be too emphatically repeated that in all these suggestions there is no thought of anything but self-supporting industry, that it is distinctly to recommend certain kinds of work which, being fairly well done by women, shall recommend themselves to that only true and lastingly valuable patron, the public, these suggestions are offered, and that it is only the first "push" that is needed or asked.

THE party of teachers and students of Lasell Seminary, Auburndale, Mass., which is spending the vacation in Europe is having a profitable trip. Mr. Bragdon is getting some rare art treasures, with the generous provision of the Trustees, including some rare original etchings of masters for the use of the students in Drawing.

MRS. MARY F. MCCLOUD, Darlington, Beaver Co. Pa., wants to know name of the lady who wrote over *nom-de plume* "Alabama" from Carrollton Ala., in RURAL, 11 May.

FIRST meeting of the Woman's Club comes off in RURAL of September 7. Be sure and send you contributions in time for publication.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

MY NEIGHBOR'S LACE LAMBREQUINS.

"For the land's sakes!" exclaimed Mrs. Brown, dropping in upon me for a morning's call, "what an extravagant creature that young Mrs. Harman is! why just as I was coming through the back yard, I happened to glance up, and I do declare, if there to all her kitchen windows didn't hang the most beautiful lace lambrequins I ever set my eyes on.

"Lace lambrequins at her kitchen windows! you must be mistaken."

"No, I am not, and if you don't believe it, jest go and look for yourself."

I did so; and there, sure enough, were hung what appeared to be elegant lace lambroquins.

"She'll ruin that husband of hers," continued Mrs. Brown. "I must say it makes me angry to see such doings. Mr. Brown is worth twice as much as her husband, and I never thought of having anything but green paper curtains at any of my windows."

"Well," I remarked, "I think myself, it is a very extravagant move. Young persons when starting in life, should be economical, if ever, and look out for a rainy day."

"Have you called?" asked Mrs. Brown.

"No, but I should like to."

"Then supposin' you slip on your bunnit, and we'll jest step over. Those lambrequins have made me kind o' curious."

I assented, and in less than five minutes we stood at the door of a pretty cottage.

"Good morning, ladies," said Mrs. Harman, appearing at the door in a neat calico morning dress, "walk in," and she ushered us into a cool, shady room, whose windows were draped with curtains of white dotted muslin.

She was very social, and we fell at once into a pleasant chat. At last Mrs. Brown introduced the topic of domestic economy.

"Yes, indeed," said Mrs. Harman, "I know something of economy. Harry and I are just starting in life, and I feel we ought to save in every way that we can, without infringing upon our real comfort. He wanted me to keep a girl, but I told him, no, that I had much rather do my own work, and I find it very pleasant too. Through the hot weather I arise bright and early, and get all the baking and sweeping out of the way before breakfast; then I have plenty of leisure to sew. Yesterday, I finished those curtains, (pointing to the window,) I didn't think they would do so well. I made them out of a couple of old white dresses that I had thrown aside—"

"You ought to have put your lace lambrequins in here," said Mrs. Brown.

Mrs. Harman looked puzzled.

"What do you mean?" she asked.

"Why them beautiful lace things you've got hanging up to your kitchen windows; I couldn't think of such extravagance in my house."

Mrs. Harman broke into a hearty laugh—

"Won't you step out and look at them?" she asked.

"Well I never! if I ain't beat!" uttered the amazed Mrs. Brown, as we surveyed them, For lo and behold, they were nothing but newspapers cut and notched in imitation of lace pattern.

Mrs. H., kindly showed us how to fold the papers and cut them, so we both walked home and hung lace lambrequins at *our* kitchen windows—try it. M. E. STONE.

CRINKLED MUSLIN.

The secret whereby sheer muslin is made to assume the new desirable appearance of crape, is this. The dress, tie or bow, is washed in cold water, without the use of soap or starch. To the rinsing water is added a little clear coffee—only enough to give the muslin a faint creamy cast. Then wring out by twisting the goods into a rope, as tightly as possible, and winding it around the clothes line—like a vine—securing it at each end. In this way let it dry thoroughly. Then carefully unwind and shake out, and if successful, the muslin will have that creamy, crinkled look alone known in crapes. MARY B.

DOMESTIC RECIPES.

Sliced Cucumber Pickles.

Medium-sized green cucumbers, pared, and sliced, as for the table. To four quarts of slices add one large spoonful of salt, mixing it through them. Let them stand over night, and in the morning, rinse, and drain through a colander. Boil vinegar with whole, white mustard seed, half a teacupful of seed to two quarts of vinegar and set it away to cool. Pack the sliced cucumbers in quart cans, and cover with the prepared vinegar. Place a bit of alum on top of the pickles in each can, and seal. Keep in a dark, cool place. Pickles made after this rule, retain much of the natural flavor of cucumbers.

Sliced Tomato Pickles.

One peck of green tomatoes, sliced; mix with them one half teacupful of salt. Let them stand twelve hours, then drain. Place them in a large porcelain kettle, or new tin pan. Add one pound of brown sugar; one-fourth pound of ground mustard; one tablespoonful of whole cloves; one tablespoonful of allspice; one-fourth pound of stick cinnamon; one large green pepper, left whole. Cover with best cider vinegar, and set on the stove. As soon as the vinegar begins to be warm, with a large spoon turn the slices over and over, until they are of a yellow color. Be careful not to break them. When done, pack in jars and cover closely. Tomatoes for this pickle should be *entirely* green.

Chopped Tomato Pickles.

One peck of green tomatoes sliced, and sprinkled with one teacupful of salt. Cover with cold water, and let stand over night; rinse in fresh water; put three onions and three green peppers (medium size,) to the tomatoes, and chop all fine. Scald in weak vinegar, and drain. Add one cupful of grated horse-radish; one pint of white mustard seed, (whole;) two teaspoonfuls of ground cloves; one of ground cinnamon, and one teacupful of brown sugar. Pack in jars, after mixing the mass very thoroughly, and cover with cold strong vinegar.

Peach, Flavoring Extract.

The meats of peach pits, in brandy, make an excellent flavoring extract, resembling that of bitter almonds. Allow one teaspoonful of the meats, to two of brandy. Take one teaspoonful of the liquor to a quart of custard, or cake dough.

Grape Pickles.

Select small bunches of ripe, firm grapes and pack in the jars, in which they are to be kept. To a quart of vinegar, add a half pound of sugar; one-fourth of a pound of stick cinnamon, and an ounce of allspice, (whole). Boil, and when cold, turn over the grapes. They will keep without sealing. Stone jars, holding a gallon each, may be used for these pickles. A piece of white cotton cloth, should be spread over the clusters, and a plate placed on top, to keep them under the vinegar.

Green Corn Griddle Cakes.

One pint of grated sweet corn; one teaspoonful of salt; one beaten egg; one large spoonful of sweet milk; two large spoonfuls of flour; and a little black pepper. Add a large spoonful of melted butter, and mix well with a spoon. Drop on a hot, buttered griddle, and fry until of a rich brown color, on both sides. Shape the cakes so as to resemble oysters, which they are like in taste. Nice with meats for dinner, if served very hot.

Lima Beans.

After shelling, let them lie in cold water for an hour; drain, and add enough boiling water just to cover; cook until tender, or until the beans are nearly dry. Season with pepper and salt. Add a teacupful of milk, and a bit of butter and let the beans boil up once before serving.

Tomato Sauce.

Pare and slice one peck of *ripe* tomatoes, and one quart of onions. Sprinkle with one teacupful of salt, and let them stand two hours; then drain; next, add one half ounce of black, ground pepper; one-fourth pound of whole, white mustard seed; one large spoonful of ground cloves; one teacupful of brown sugar, and one quart of vinegar. Boil all together, for three hours. To be eaten with meats, like catsup. Omit onions, if not liked.

Iowa, MRS. M. G R.

News of the Week.

POLITICAL.

MONDAY, August 26, 1878.

On Wednesday a conference of the principal Hayes republicans of this State met at Saratoga, principally to concert measures for the defeat of Conkling's re-election to the Senate. The participants are gentlemen of high character, but with a slim following, and many of them would sooner see a democrat elected than the present senior senator from the Empire State. The present outlook is that there will be a fierce struggle over the election, and that this very handsome, aristocratic tail will try hard to wag the shaggy republican dog. Should the dog refuse to be wagged, it is not improbable that the tail will attempt to disrupt it, and, failing in this, will, at least temporarily, part from it and try to find a place at the head of the rival animal. On the following day, Thursday, the Democratic State Committee decided, at the same place, to hold a State Convention at Syracuse on Sept. 25. The meeting was under control of the Tammany or anti-Tilden party: and it was made evident that the alleged bargain with the Conklingites is a myth. The general feeling was that the democrats would be able to secure a majority of the next legislature, and so be able to elect a United States Senator, even without the aid of disaffected republicans. The movement to place Ben Butler in the Governor's office in Mass. has been actually started by the circulation of a vast number of petitions asking him to run as an independent candidate. Up to yesterday these were open for signatures, and it is expected that 12,000 have been received in Boston, and 40,000 in the State at large. Meanwhile all the "kultsha" of the "Hub" and a good deal of the respectability of the State are in dire alarm lest "bug-bear" Butler should be elected by the "rabble" as the highest representative of the inhabitants of the commonwealth. It is said that President Hayes has contributed liberally towards campaign expenses in the fall, and notwithstanding the uplifted hands and eyes of civil-service reformers, it has been decided that the citizens of the different States employed in the Departments at Washington, shall be given leave of absence to go home and vote. Some time back postmaster Smith, of Chicago, refused to permit his subordinates to be taxed for campaign expenses, and thereby got into hot water with the Republican National Committee at Wahington; and now postmaster Loge, of Cincinnati, has bruskly refused to contribute, and there is a number of sportsmen hunting for his official scalp.

In spite of the number of times the newspapers have brought Alex. H. Stephens, of Georgia, to death's door, or even thrust him inside its threshold, the old man has lived to brilliantly defeat the bourbons of his district who wished to ostracise him from the democratic party on account of his patriotic independence during the late electoral troubles. He is now receiving congratulations from all sides on his unopposed renomination to Congress, after an active personal canvass of his district, during which he displayed much of the eloquence and statesmanship that, a generation ago, won him his celebrity. The numbers of men, up North here, willing to serve their country in Congress, is by no means small, but down South the number is vastly greater. For instance, outside Stephens' districts in Georgia, there are said to be at least five congressional candidates for the least contested districts in the State, and the number of aspirants range up to more than twenty for many districts. The fact is almost every Southern man with a common-school education, is a statesman, or flatters himself with that notion.

The Tenessee democratic convention arraigns the republicans for the conversion of greenbacks into bonds; for demonetizing silver; for establishing national banks; for fixing a period for resumption; for levying high duties on tobacco and alcoholic drinks and for administering the government in the interest of the rich and against the poor. It then demands the repeal of the Act making bonds payable in coin; the repeal of the Resumption Act; the substitution of greenbacks for national bank notes; the raising of all future government loans by the issue of paper money bearing no interest; the coinage of silver in unlimited quantities and the payment in it of all government obligations. This platform is condensed as a specimen of what the bulk of Southern platforms will substantially be this fall. By the way, Secretary Devens says he has no ambition to run for the governorship of Tennessee. Mr. Spear, Commissioner of Patents has been removed, and Gen. Paine, ex-member of Congress from Wisconsin, appointed in his stead, much to the disgust of civil-service reformers who think that a subordinate could easily have been found in the office capable of discharging the duties of the position much more effectively than the new appointee. What adds to their disappointment is that the change has occurred in the department of Secretary Schurz, the model S. C. R.

The Potter fraud committee still continues its investigation in this city; but during the past week its control has been entirely in the hands of Ben. Butler, who has spent nearly all the time in an attempt to fix directly upon the President the responsibility of the bargain, in accordance with which the republican governments in Louisiana and South Carolina were overthrown. The public of all parties are getting wearied of the interminable wrangles and contradictions of this body, and the wish seems pretty general that the committee should "give us a rest." Leet, the lively witness of last week, who became crazy at the close of his examination, has been sent to Bloomingdale Insane Asylum, suffering from acute dementa. Doctors say he may recover in six months or so. Howitt's Committee on Labor has been listening during the week to various theories on the present business depression. Only a few representaves of labor appeared before them, but their place was supplied by professors of colleges, manufacturers and merchants—the general opinion being that over-production is the cause of the stagnation. Out in Lee and Phillips counties, Arkansas, the democrats are reported to have adopted the "shot-gun" plan of carrying an election. The congressional district, of which these counties form a part, gave Hayes 2,000 majority, and now the republicans declare they are afraid to run a ticket. Governor Miller has ordered the armed bands to disperse, but the republicans say that, even if the order is obeyed, it has come too late.

MISCELLANEOUS.

Good news for dairymen! Cheese has been adopted as an army ration. The benefit from this measure will not arise so much from the quantity of cheese consumed by our handful of troops, as from its tendency to popularize its use among the people at large. For, although Americans eat more butter than any other nation proportionately, there is little doubt but that they use less cheese. Out in Dakota, on the Dairymple farm, 13,000 acres of wheat were cut in just a dozen days. It is all No. 1 wheat, aggregating at least 300,000, and 15 steam threshers, each threshing 1,000 bushels a day, will turn out the whole of it in 24 days. It is Chicago that furnishes the most noteworthy of dishonest rascals this week, in the person of C. W. Angell, secretary of the Pullman Palace Car Company, who has absconded to Europe with upwards of $120,000 of the money intrusted to his keeping. 'Twas a clear case of robbery not of defalcation, this time. Missouri is sadly burthened with a tricky State treasurer named Gates. This worthy has been bolstering a couple of rotten banks, controlled by his bondsmen, by depositing in them the money of the State. The banks, however, failed, and the State has thereby lost a round million, without getting rid of its treasurer, however, who still continues to deposit the public taxes in the bank of St. Joseph, whose president is also on his bond.

Some time back it was mentioned here that an act with regard to the Hot Springs, Arkansas, Government Reservation, passed just at the close of last session of Congress, had not been enrolled by the clerks, and thus remained inoperative. It is now stated that the error was due to the dishonesty of two congressmen and as many clerks, who were bribed to cause the omission, by parties interested in the springs who would gain by this rascality. Up in Western Vermont migrating quails are proving themselves as formidable enemies to potato beetles as Guinea fowls are reported to be elsewhere. For some time back there has been a heavy emigration of the industrious inhabitants of Iceland, who, at home, have been sorely troubled by volcanic fires and hyperborean cold and ice during their long nights and equally long days. Lately 400 of the wanderers arrived in Quebec, via Glasgow, Scotland. Of these, 100 will remain in Ontario, Canada, another 100 will settle in Lyon Co., Minn, while the remaining 200 will join the colony already established by former bands of their countrymen away out in Manatoba.

A prominent Chicago paper having lately charged that oleomargarine or "tallow-butter," was being mixed with the creamery butter manufactured in the neighborhood of Elgin, Ill., a number of the largest manufacturers of creamery butter thereabouts, together with the members of the Board of Trade for the sale of dairy butter, emphatically denounce the statement as false, *so far as they are concerned*, and strongly repudiate the use of the concoction. Granting full faith to the guarded denial of these gentlemen, there is no particle of doubt but that a vast quantity of oleomargarine is used in this country in the manufacture, or rather adulteration, of dairy products, and the restriction placed upon this denial, coupled with other reasons, renders it not improbable that other butter-makers in that region participate in the fraud. This is an abuse the prompt exposure of which is of importance to the entire dairy interest.

An abstract of a chapter from the Report of the Bureau of Statistics of Massachusetts has just been issued in anticipation of the publication of the whole book next January. It gives a detailed estimate of the unemployed skilled and unskilled laborers of that State on the first of June. The estimate has been compiled from reports on the subject forwarded by the officials of each district, and wherever the reports were conflicting, that giving the greatest number was invariably adopted. It is the first official attempt in any State in the Union to get at the actual number of unemployed laborers. It was roughly estimated that there were in the Bay State 200,000 pair of adult hands compulsorily idle. This Report gives the number of unemployed males and females over 18 in the whole State, at 28,508. About the first of June, it is true, laborers were busy in agricultural districts, but work in the factories was at that time especially slack and some of them had temporarily "shut down." On the above basis, the number of unemployed in the United States reaches 570,000—a vast number truly—but happily small, in comparison with the estimate of 3,000,000 about whom politicians, demagogues and growlers have lately been complaining. In view of the fact that, in the entire country, there are only 10,000,000 people engaged in productive industries, the exaggerated absurdity of the 3,000,000 estimate is readily apparent.

Last Wednesday a meeting of prominent lawyers from nearly every State in the Union, met at Saratoga, N. Y. to organize a National Bar Association, in response to a call signed by Sec. Evarts, Ex-Sec. Bristow, Stantley Mathews and three other prominent lawyers. A resolution was adopted to invite to membership those only to whom circulars to attend the convention had been issued. It is to be hoped the new organization will act as a censorship on the members of the legal profession and take measures to rid it of the host of pettifoggers and shysters that now disgrace it. Such a measure would be a boon to the public, by rescuing it from the exactions and disreputable machinations of these gentry, and greatly benefit honorable lawyers by freeing them from competition with—well, should one say two-thirds of the profession?

During the week there has been a great deal of newspaper wrangling going on between Dr. Carver, the wonderful rifle shot, and Capt. Bogardus, the shot-gun champion. The former has just married, and the latter has just got back from his European triumphs; and between them there is a good deal of jealousy as to their respective merits. Several challenges have been issued by both, but while each professes to be anxious to meet the other, they cannot decide on a stakeholder, the Captain nominating, as usual in such cases, the editor of a sporting paper, and the Doctor, as an advertising dodge, naming a manufacturer of fire-arms. Each has been calling the other "pet names" and accusing him of "funking," but to an outsider Bogardus certainly seems to be bent, more than the other, upon "business." During the week Kearney has been "swinging round the circle" out West, having addressed meetings in Chicago, Indianapolis and Cincinnati. His harangues were mere repetitions of his past tirades of abuse, profanity and black-guardism, intermingled with a chunk of sound sense here and there, and an occasional burst of genuine eloquence. The fact is, the fellow said all he had to say the first time, and unless he used a great many superfluous words, all he had to say worth listening to, could have been said in ten minutes.

Yellow fever still continues its ravages in the lower Mississippi valley with even increased virulence. Yesterday there were in New Orleans 163 new cases and 33 deaths; in Vicksburg there were 85 new cases and 22 deaths; in Memphis 61 new cases and 27 deaths, while in Grenada the dead and dying are huddled together in the same room, with not enough well people about to bury the former or nurse the latter. Many nurses and doctors after struggling heroically, have been either stricken down themselves or terrified into flight. All who could leave the

scenes of pestilence have done so, but of the fugitives many have borne away with them the germs of disease and perished as far away as Philadelphia, Cincinnati, St. Louis, Brooklyn and New York. Society is utterly demoralized; the poor are starving for want of work and want of food; the predatory classes are robbing the houses whose defenders are sick or dead; parents flee from their plague-stricken children and children shun their dying parents; while through the scenes of agony and death noble men and women, clergymen, doctors and merchants, are busy on errands of mercy and relief. From all the tormented cities come supplications for more nurses, more doctors, and, for Heaven's sake! more money with which to provide the necessaries of life for the suffering people.

FOREIGN.

Another famine is threatened in Ireland by the failure of the potato crop. In 1847 a similar failure caused half a million deaths by starvation in that unhappy country, despite the ill-managed aid of the British Government and the tardy charity of the world. So vast a calamity would now be impossible, yet there is every prospect there of a great deal of suffering. Last year the crop is said to have been a dead loss, the yield in some places not paying a tenth of the cost; and now come reports that the vines are blighted and the tubers tainted. It has been argued with a great deal of force that one of the heaviest curses on the Emerald Isle is the nearly universal culture there of potatoes. Besides the misery their failure has brought in late years on the inhabitants, the ease with which a wretched livelihood was formerly got from them, rendered the bulk of the natives lazy, improvident and unambitious—faults which years of suffering and often exile have not yet eradicated from the character of many of them.

Garribaldi has issued another letter bitterly inveighing against Austria and heartily approving German socialism. Recent elections in France indicate that the Senate will, after next elections, have a republican majority, the same as the Assembly. Hitherto the majority in that body was composed of monarchists and imperialists, and should the republicans gain control of it, it will tend to assure the permanence of the Republic after 1880, when McMahon's presidency terminates and the future form of government is to be definitely decided. Meanwhile, the ex-empress, Eugenie, is being brilliantly feted in Vienna by the Emperor and all the great Court dignitaries, while her son, the Prince Imperial, is being treated with equal distinction during a tour through Norway and Sweden. The Emperor of Morocco, in whose territory a terrible famine has lately been raging, has of late been killed several times by cablegrams, and now, once more, they place him at death's door from the effects of poison. It is reported that the negotiations between Bismarck and the Vatican have fallen to the ground, and that the Ultramontanes in the Reichstag will therefore oppose, as heretofore, the Chancellor's policy. The prizes at the Paris Exposition will be distributed October 21, when, contrary to a late announcement, the great show will close with a magnificent fete.

As an illustration of the all-pervading official corruption in Russia, it is now stated that the reason why Gen. Todelben replaced the Grand Duke Nicholas in command of the Russian army before Constantinople was that the latter had accepted a present of 7,000,000 francs from contractors for furnishing moldy bread and rotten hay to troops operating in Bulgaria, and that for this corrupt act he has been banished to his estate at Perm, Gen. Greigh, who established the fact, has been made minister of finance, and ninety field officers who shared in the plunder are to be disgraced. Numerous instances of the grossest kind of peculation and dishonesty in all ranks of Muscovite official life, have lately been made public, and it is highly doubtful whether the standard of official honesty is any higher in the huge monarchy across the water than it is in the great republic on this side of the Atlantic. A new Russian 6 per cent loan of $214,000,000 is about to be placed on the market. The funded debt of the empire is now $1,500,000,000 and its floating debt $1,000,000 more. Since the Muscovite war with Khiva, their forces have been kept pretty busy operating in Central Africa in the direction of British India. It was lately announced that they had received the submission of a Khan who had hitherto been dependent on Afghanistan and whose territory was only 250 miles distant from the English possessions. News now comes that all movements in that quarter have been terminated and that the troops have been recalled home. The war between the Austrians and Bosnians still continues, though the former have gained several important successes, and the latter begin to show signs of demoralization. Austria will soon have in the field 185,000 men, enough to crush all opposition, and perhaps to call Servia and Montenegro to account for aiding the insurgents. Greece has appealed to the Powers to force Turkey to concede to her the territory she was partly promised by the Berlin Congress, and her petition, it is said, meets with favorable consideration. The Russian troops near Constantinople are embarking for home, but fresh men are on their way from Russia to take their places.

With regard to the agricultural prospects in the British Isles, Mr. James Caird, the best English authority on the subject, wrote to the London Times, last Thursday, as follows:—"The agricultural returns of Great Britain show a small increase in wheat and barley and a decrease in oats. The acreage of wheat has increased 50,000. Estimating Ireland at a slight increase, the total acreage of wheat in the United Kingdom is 3,400,000. The new crop is fully up to the average and better than for some years. It will yield 92,000,000 bushels, leaving 104,000,000 bushels to be drawn from abroad. The French wheat crop is believed to be below the average, and the French will be buyers instead of sellers. The present prices will probably be maintained, or perhaps be slightly increased, but there will be no scarcity. The potato crop will be about the same in extent as last year's. There is less disease than for several years past at the same period. Young cattle have increased 40,500 and lambs 263,000."

HERMAN.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Aug. 24, 1878

BEANS AND PEAS.—Dealers express very little confidence in the bean market, and nearly all holders who have missed much the light summer trade are willing to shade prices for the standard sorts; other grades almost nominal. One cheering feature has been developed lately; the supplies of old to come forward are less than anticipated, while it is thought that the principle growing districts will not have new cured specially early; farmers report cold rains and other impediments to an early harvest. Still at this date no speculative fever is likely to set in, and sellers will be apt to push stock out as fast as the demand will call. Green peas, $1 20@1 25 for crop of 1876. Canadian, in bulk and bond, unchanged, 76½@77c.

We quote medium beans, prime, $1 50@1 52½; fair to good, $1 35@1 35; marrows, prime, free on board ship, fair to good, $1 40@1 45; Pea, $1 35@1 50; white kidney,

Exports of beans past week, 749 bbls.; receipts, 3,000 bush.

BEESWAX.—There is a very meager business but prices steady; Western and Southern quoted 27@28c.

Exports since Jan. 1st 112,950 lbs. Same time 1877, 8,725 do.

BROOM CORN.—Offerings are moderate tight and prices are steady. Latest prices are 6a6½c. for hurl and short brush; 5@6c. for medium green, and 4@4½c. for red and red tipped per lb.

BUTTER.—Receipts are larger, but are largely composed of medium grade, and many parcels give evidence of having been held when they should have been sent in. Every season somebody learns a lesson through "holding for a rise." Prices have slackened, and with the moderate demand State is forming buyers; jobbers can obtain choicest lots at inside figures. The outlook for the coming week is a blue one, for both State and Western.

State dairy, pails, choice, 19@20c.; other, 14@18c.; half tubs and pails, choice, 18@19c.; other, 14@17c.; Welsh tubs, choice, 17@18c.; other, 14@16c.; poor State, 10@12c.; creamery, best, 23@24c.; good, 19@20c.; sweet cream, 19@21c.; Western creamery, best, 21@22c.; other, 14@20c.; Western dairy, selected, 13@14c.; fair to good, 10@11c.; factory, best, 10@12c.; fair to good, 8@9c.; very poor, 6@7c.; grease, 4@5c.

Receipts for the week 33,000 pkgs.; Exports, 13,317 pkgs.

CHEESE.—Early in the week prices hardened a little, but larger supplies coming forward since have forced an easier market, more particularly on other than the choicest colored lots. Shipments for the week are 115,000 boxes.

Quotations are: Fancy at 8¼@8½c.; 7¾@8¼c. for good and prime; 6¾@7¼c. for fair; 5½@7c. for half skimmed; 3@4¼c. for skimmed. State, farm dairy at 7@7½c. for good to choice, 6@6¾c. for fair to good, and 3@4¼c. for poor skimmed. Wisconsin factory, fine to fancy, 8¼@8½c.; do. good to prime, 7@8c.; do. fair, to good, 6@7c.; Western factory, fine, full cream, cheddar, 7¾@7¾c.; do. fine, full cream, flat, 7¼c; do. slightly skimmed, flat, 6¾@7c.; do. half skimmed, 5a6c.; do. full skimmed, 3@4c.

Receipts for week, 133,975 boxes,
Exports for week, 115,170 boxes,
Liverpool cable quotation, 44s.
Gold closes at 100¼.

COTTON.—Fluctuations have been frequent, but on the whole prices have tended to a higher basis through the southern advices. Latest prices are for August, 11.38a11.39c.; for September, 11.69a11.70c.; for October, 11.41@11.45c.; for November, 11.24c.; for December, 11.17@11.18c.; for January, 11.17a11.18c.; for February, 11.23@11.25c.; for March, 11.29@11.31c.; for April, 11.36@11.38c.; for May, 11.41a11.45c.; June, 11.48a11.50.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*Ala.*	*Orleans.*	*Texas.*

DRIED FRUITS.—New fruits have tended easier, being plenty, freely offered and dull. Old stock is inactive.

New blackberries, are quoted at 5½c. Peaches—Peeled, new Georgia, 4a5c. for poor, 6a7c. for good and 7¾@8 for prime; unpeeled old halves, 3@3½c.; quarters, 2½@3¼c. Pitted cherries, 14c.; southern plums, new, at 9@10c. Apples—State quarters, 3@4c.; do. sliced, prime, 4¼c.; good, 3½@4c. New apples at 3c. for southern quarters in bbls, New raspberries, 22c., and evaporated, 24@25c.

Exports since Jan. 1st, 10,754 bbls. apples. Same time last year, 23,445 do.

EGGS.—Receipts for the week, 5,135 bbls.; do. last week, 4,747 do. Prices have run up quite rapidly during the past few days with a good business attending. Sellers are a little nervous over the favorable variation from past movement as they fear the market may be "too good," by which they mean that supplies may be loosened to an extent that will send rates down again—and they know it is a difficult matter to turn them up after a fall.

Near points, 18a19c.; State and Penn., 18@18½c.; Western, fresh 17a17.8c.; do., Canadian, 17½@18c.; inferior stock, 16½c.

FLOUR.—The supplies are large and prices tend a little easier, more especially for other than choice lots of winter wheats and Minnesotas.

Latest prices are $3.40@4.00 for very inferior to fancy superfine State, the latter an extreme; $4.00@4.30 for poor to good extra do. odd lots and lines; $4.20@4.50 for good to very choice do.; $3.35@4.00 for very poor to fancy superfine Indiana, Iowa, Michigan, Ohio, &c., $4.00@4.20 for inferior to good shipping extra do. and $4.20@4.50 for good to very fancy extra do.; common to about choice white wheat extras, $4.20@5.40; choice to very fancy do at $5.50@6.50; red and amber winter wheat, inferior to very choice trade and family at $4.15@5.75; round hoop Ohio at $4.00@$4.30, and trade and family brands of do. at $4.35@$5.75, the latter rate for choice, (very choice to fancy lots quoted higher); St. Louis, $4.25@5.00 for very poor to good extra, and $5.00@6.25 for good to very fancy; Minnesota clear, very inferior to very choice at $4.20@6.00 (fancy brands at higher prices); Minnesota "straight," very inferior to very fancy, at $525.@7.25, and patent poor to strictly fancy at $5.50@8.85; unsound stock at from $3.00@5.25; city mill extra at $5 25@5.40 for West Indies (the latter rate for fancy in new packages); do. for England, 4.00@$4.15; do. trade and family extras, $5.25@6.75; do. for South America, $5.45@6.00 for fair to fancy; No. 2 $2.50@3.25 for inferior to very fancy.

CORN MEAL.—Is selling at $3.40@2.75 for yellow Western, and $2 95 for Brandywine.

FRESH FRUITS.—There has been a fairly brisk trade in apples, but the quantity is still bulky enough to prevent an advance in prices. The new "King William" brings the highest rate and is certainly the finest high colored variety ever shown here at such an early date. Peaches have lost much of their steady sale; quality has ruled poor for several days, and even with the comparatively light supply a good many failed to sell on arrival as has been the custom this season.

New Jersey fruit is turning out very badly, in fact dealers would rather not handle it. Prices this week showed a wide range. Pears are in liberal supply, but a good portion of them are rough; only first quality of fancy bring an extreme. Grapes are irregular in price; some southern stock, especially large packages of loose, cannot be definitely quoted. Plums are looking well. Dealers are annoyed with the lack of uniformity in bbls., and intend, if possible, to make bushel rates the standard. It is reported that rain has injured the Wisconsin cranberry crop. Apples, Nyack pippins, bbl., $1@1 50; Orange and Golden, $1@1 25; King William and a few other extras, $2@2 50. Pears, Bartlett choice, $5@6; common, $3@4; Clapp's favorite, $4@5; cooking and useful, but common table, $2 50@3. Plums, Quackenbos and Magnum Bonum, $7@8 bbl.; green gage and egg, $5@6; blue gage, $4@4 50; Davison, $5. Grapes, southern, Delaware, 11@13c. lb.; Ives and Concord in good order; 5@7c. Whortleberries, $2@2 50 bush. Peaches, Del, crate extra, $1 75@2; other, $1@1 50; baskets, extra, $1 75; other, 75c@$1 50; N. J., 40c.@$1 25. Watermelons, N. J., per 100, $15@25; Md. and Del., $10@25; Va., $8@10. Hackensack nutmegs, $2@2 50 bbl.; Keyport, 50c.@$1 00. Peanuts unchanged, holders anxious to sell; Va. hand-picked, $1 45@1 50; other, $1 25@1 35. Hot-house grapes, 30@65c. lb.; varieties, Black Hamburg, muscat and Sweet Water, California grapes brought $5 per 40 lb. crate. Seckel pears, $5 50 box; plums, $4.

GRAIN.—Wheat has shown the heaviest transactions ever known here, partly speculative, but to a fair extent on orders from the continent; prices after advancing have closed weak. Corn is active at firm prices. Oats have had a fair trade demand, and at steady prices.

Latest sales of wheat are of No. 1 Milwaukee or Minnesota spring at $1 18; amber southern at $1 11; ungraded red at 72c.@$1 10; No. 2 red, steamer grade, at $1 06@1 07, No. 2 red at $1 08¾@1 09¾; white State at $1 20@1 20¼; do. steamer grade, at $1 15@1 15½; No. 1 white at $1 18¾@1 19¾; No. 1 white, steamer grade, at $1 14@1 14½; No. 2 white at $1 10@1 11; No. 3 white at $1 07@$1 08; ungraded white in lots, at $1 08@1 08½; amber Michigan and No. 1 red, at $1 11@1 12; No. 2 amber in lots at $1 07¾@1 08¾; No. 2 amber, steamer grade, in lots at $1.04@1.05; ungraded amber in lots at $1 09@1 12; No. 2 red, first half September, $1 09¾; No. 2 amber, by sample, at $1 07½; New York No. 2 spring, October option, at $1 06; No. 2 red August option, at $1 09¾@1 09¾; do., September option, at $1 09¾@1 09¾; do. October option, at $1 08¾, Rye at 62@64c. for western, and 64@65c. for State. Corn for New York No. 2, August option, at 48¾c.; do., September option, at 49¾c.; do., October option at 51¾@52¾c.; steamer mixed, August option, at 48c.; do., September option, at 46c.; do., October option at 51@51¾c.; spot lots include ungraded mixed at 44@48c., mainly at 46@48c.; steamer mixed at 47@48c., and New York No. 2 at 48@49¾c.; mainly at 48½@48¾c.; yellow western at 53c., and New York No. 2 white at 54¾@55½c. Oats are for York No. 2 white at 31¾@32c.; No. 3 do. at 28@29c.; New York No. 1 at 32½c.; New York No. 2 at 30@31c.; do. for August delivery, at 31c.; New York No. 3 at 27@27½c.; New York rejected at 27c.; unmerchantable at 25½c.; while western at 29½ to 35½c.; mixed western at 26 to 33c.; white State at 32 to 37½c.; mixed State at 30@@33½c.; No. 2 Chicago quoted at 33c.; No. 2 Milwaukee at 33@33½c.; No. 1 white quoted at 38@38½c.; New York extra quoted at 33½@34.

HAY AND STRAW.—New hay comes in freely and prices are easy for other than prime lots, quoted at 45@50c. for shipping, and 70@80c. for retail qualities. Straw quoted at 35@45c. for long rye; 25@30c. for short rye, and 25@35c. for oat.

Exports past week 405 bales. Since Jan. 1st, 42,018 do.; same time last year, 31,418 do.

HOPS.—There is nothing doing outside of small lots to brewers, and prices are altogether nominal. The estimates of the new crop are of a freer yield than expected a fortnight since.

Quotations are for New Yorks, good to prime, 10@12c.; do., low to fair, 7@9c.; Eastern, 7@10c.; Wisconsin, 7@10c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.; Pacific Coast hops, 10@12c.

POULTRY AND GAME.—Live poultry is plenty and prices are low.

Chickens, N. J, 13@13½c. lb.; State and Penn., 12½@13c.; Southern and Western, 11@12c. Fowls—N. J. 12@12½c; S. & W., 11@12c.; Southern, 10@11c. Roosters, 5a6c. Turkeys, near by, 12@13c.; other, 10@11c. Ducks, 40@75c. pair, including spring. Geese—N. J., $1.50@1.75; S. & W., $1@1.50.

Dressed Poultry easy in price. Phila. dry picked, 15@16c.; other, fair to prime, 13@15c.; Pa. dry picked, chickens, 17@19c.; N. J., 15@17c.; State 15@16c.; Southern, 13@15c. Phila. dry picked fowls, 14@15c.; State and N. J., 13@14; poor, 11@12c.

Game is in light supply; prices weak. Woodcock, State, 70@80c. pair; do. Western 60@70c. Eng. Snipe, $1.25@1.50; grass plover, $2@2.20; stall-fed pigions, $1.62@1.75; tame squab, $1.50@1.75.

PROVISIONS have tended lower, and in less demand. Mess pork quoted $10 20; $10 25 for spot lots. $10 10@10 20 for September; $10 20@10 30 for October. Bacon at 6¾c. for long clear, and 6¾c. for short clear Lard—western steam at $7 45 for spot lots; $7 42½@7 45 for August and September; $7 50 for October. Stearine at 8½ for choice. Tallow at 6 15-16c.@7 for prime. Beef hams at $20 50@21. Beef—extra mess, $11 25@11 50; plain mess, $10@11; packet, $11 25@12 for bbls.; extra India mess, $18@20 for city brands; do. Philadelphia, $17 75@$18.

SEEDS.—Grass are quiet; old clover sold at 8; new timothy to arrive at $1.40, and flaxseed at $1.47½.

TOBACCO.—Export trade continues brisk, and prices are well sustained.

VEGETABLES.—Exports for week 3,650 bbls. potatoes. The demand is still supported by exporters; prices are somewhat better, as quality is improving. Tomatoes are low; on some days the buyer has almost made the price. Egg plants show a large crop, and are extremely low. State E. Rose potatoes $1 75@2; double heads, L. I. and N. J, $1 50@1 75 bbl.; culls 40c.@62; sweet potatoes, yellow, $2 75@3; red $2. Hackensack sweet corn per 100, 50c.@$1. Lima beans, bag, $1@1 50; String beans 50@62c. Cucumbers per M. $1 25@1 75; small $.@3 50. Large tomatoes, 3 peck crates, 15@25c. Onions, white, $1@1 50 bbl.; yellow and red $1@1 12. Marrow squash $1 20@1 50; crook neck $1. Bullnose peppers $1. Beets, 100 bunches, $1. Carrots do. $1. Lettuce, bbl., 50@75c. Cabbages, flat Dutch, 100, $4@5; red $5@6. Egg plants, 100, $2@3. R. turnips, bbl., $1. Okra, per 100, 10@15c.

WOOL.—Manufacturers buy sparingly, but the temper of the market is steady on other than fine stock; sales of XX Ohio fleeces, 37c.; X and above Ohio, 36½@38c.; unwashed fleeces, 24@26c.; combing and delaine at 45c.; spring California at 20@23½c.

LIVE STOCK MARKETS.

Saturday, Aug. 24, 1878.

BEEVES.—Receipts for the week, 9,404 head; do., last week, 10,021 do. Receipts have been less oppressive, and the weather has been more favorable for butchers' business. Still buyers are not enlarging purchases to extent that insures very strong prices. Latterly the trade at the yards has been brisk, opening with a slight advance over Wednesday, but closing weak. Good to prime native steers, 8@10c.; selected 1 ¼c.; fair Colorado half breeds, 8¾@9c.; Colorado and Texas, 7¾@8¾c. Export sales light.

COWS AND CALVES.—Milch cows seem to be mentioned more from custom than from any steady business doing. Most of the arrivals meet with chance sales and in this way $35 for fair and $45@75 for better to good have been quoted during the week. Certainly nothing warrants the shipment of fine milkers to this market.

VEAL CALVES.—The demand has been slack during the week, especially at West Washington market. Milk range 5@6½c. for fair to good N. Y. and State, and 6¾c. for extra N. J.

SHEEP AND LAMBS.—Receipts for the week, 20,078 head; do. last week, 24,016 do. Lighter supplies made a better demand and rather firmer prices. Good to prime sheep, 4¾@5¼c.; bucks, 3@3½c. Lambs rated 6@6c.

SWINE.—Receipts for the week, 22,999 head; do. last week, 23,780. A few cars were offered at the close without buyers. Quotations for medium to good Ohio corn fed, 4¼@4½c; very common, 4@4¼c.; city dressed, 5¾@5¾c.; pigs, 6c.

Send for Dye Book and beautiful Samples, Free.
WELLS, RICHARDSON & Co., Prop's, Burlington, Vt.

Reading for the Young.

"POCKET-MONEY FOR THE YOUNG PEOPLE."—No. 15.

To be a successful farmer, merchant, or mechanic, it is a good thing to commence operations, if only on a small scale, when quite young. What! a *boy* begin to be farmer, merchant, or mechanic? Yes; it is within the reach of every boy to try some little business on his own account, and no boy has a better opportunity than a country boy. It is as much a part of his education as arithmetic or book-keeping, to expand his ideas beyond paper and books alone. On a farm there is generally a corner of an out-building, or an odd patch in the garden, which a boy, (with his parents' consent) can turn to account. It not only gives him an interest in his home, but also instructs him in care and industry. There is generally some demand for plants among his neighbors, such as cabbage, celery, hot-bed plants, etc. These can all be grown by any country youth with profit, where they are in demand; taking but little time in proportion to most farm productions; care being the most needful thing.

Another source of profit to boys is keeping a little live stock, such as rabbits, pigeons or poultry. The common rabbit is very easily kept, and all things considered, would probably be the most profitable, as they are hardy. Lop-eared rabbits are very tender, and poor breeders. All through the summer a little grass cut from the road-side, or a corner, will keep them. A few apples, or refuse vegetables (if only sound,) will be all that is required, and in winter vegetables that are not suited to market, or any parings will answer all feeding purposes. A little grain, once a day is best for their morning or night meal.

Pigeons are often in demand, but in this line something better than the common varieties will perhaps do better; but that depends on the locality, and one must be his own judge which kind is best before starting. But whatever is commenced let it be strictly honest, and fairly carried on. Now is the time that the foundation of the man is laid. Do not misrepresent anything you have to sell; integrity and a good name are worth more than anything you will ever have for sale. Many a youth has begun dealings not strictly honest, among his companions, and paid so dear for them that he could never recover his standing. When your companions grow up with you, if you are known to be honest, it is likely some may be able to assist you in a more extensive business, and at least they will have pleasant remembrances. PRACTICAL.

MACHINE FOR FEEDING POULTRY.

THE artificial hatching and rearing of poultry, ostriches and other birds has already become a science, and a profitable and important branch of business, and the further treatment of ducks and capons for market has created a demand for machinery for artificial feeding and fattening. The most important machine of this class consists of a circular cage of wood about 15 feet in diameter and 20 feet high, and containing 210 coops or nests for ducks and chickens, the cages being all on the outside.

A chick three months old is put in each nest, and by means of a band of skin or rubber fastened to a light chain is secured so that it cannot escape. In these nests the chicks, pigeons, ducks, turkeys, quails or other birds are kept till they are ready for market, each bird being artificially fed three times a day. The birds can move about and sit down, but cannot walk or fly, and this enforced rest causes them to fatten quickly. A chick having been placed in each nest, the apparatus for feeding is loaded with a mixture of barley meal, Indian meal, milk and water, and is brought up to the cage. Each fowl has been carefully examined, and the amount of food it will comfortably digest is marked plainly on the front of its nest.

The operator then takes a chick by the neck and by a gentle pressure compels it to open its mouth. A rubber tube is inserted in its mouth, and by means of pressure on a pedal, the semi-fluid food is forced into the creature's throat. A guage on the machine records the quantity of food given to each bird, and by watching this indicator just the right amount can be supplied. Ducks are at the same time given a drink of water, the other fowls not requiring water at any time. The cage containing the birds is mounted on rollers, and when one bird is fed, the cage is moved round and the next bird is brought opposite the feeding machine. When the cage has been turned round once the feeding apparatus is placed on an elevator, and the machine and the operator are raised to the next row.

In this manner every chick is in turn fed, the operation requiring about one minute for each bird. Another form of cage is made with only two rows of nests, one over the other, and with the nests disposed in lines. This apparatus does not move and the operator carries the feeding machine, by means of a truck from bird to bird. The feeding machine may be a simple pump that can be moved by a treadle, or it may be a reservoir, in which a constant pressure may be maintained by means of weights. In this case the supply of food given to each bird is controlled by a stop-cock. Contrasted with the barbarous methods of artificially feeding poultry that have been practiced for so many thousands of years in some parts of Europe, this method of machine-feeding has the advantage of neatness, dispatch, and the entire absence of cruelty to the birds. Ducks can be fattened in perfect safety and entire comfort by this method in fifteen days, and chickens in twenty days, and the loss from disease and accidents rarely exceeds two per cent.

The fowls thus treated are uniformly healthy and the quality of the dressed meat is excellent. Artificial incubators, artificial mothers, and this appliance are exhibited at the Paris Exposition. The incubators are all founded on the familiar plan of making a large reservoir of hot water and placing the eggs in a circular box in the middle. The American incubators are, in some respects, superior to the French machines, as a permanent fire is maintained, regulated by automatic governors. The artificial mothers or "hydromeres" shown at Paris, do not differ materially from those used in this country, and are all based on the same general plan of using a large mass of hot water as a means of obtaining the necessary warmth.—*Scribner for Sept.*

CARLOTTA PATTI JONES.

SHE ought to have been beautiful, she of whom I write, for who takes any interest in a heroine that is not; but in this case nature had decided otherwise, in direct opposition to every rule, a fact that is very trying to a writer, for one naturally feels a great responsibility in drawing the attention of a criticising public to one of whom the best that can be said is, that she has very bright eyes, or very white teeth; and truth prevents my saying any more regarding her personal appearance. And although I would fain endow her with every virtue, I cannot say that her disposition was any better than her looks. I know that in stories ugly people are always good, but it is not so in real life. She had an ugly temper, and a great deal of pride to contend with. Many, I suppose, will wonder why I write about one who has so few attractions, but she had a great deal of character! and, of course, a history, as who has not, be they homely or handsome. She prided herself on her family and her name, a good one, as we must admit, and one that has attained renown; but also one that caused her some trouble, for people would persist in calling her simply Puss, or just Patti.

Up to the beginning of our story her life was passed in the country, and she enjoyed new milk, fresh air, and all that goes to make life worth the living. Her people did their farming according to the RURAL, and all might have been happy had she not heard the story of those three little kittens that saved a house from burning, which filled her soul with so much ambition that she resolved to distinguish herself by learning to stand on her hind feet and look cross-eyed for five minutes at a time; and again she was known to go up to a baby, whose crying annoyed her, and strike it several times in the face with her paw; but cats, like people, do not always know how to bear their honors, for very soon she began to cultivate a taste for spring chicken, and carried this accomplishment so far that the gentleman with whom she lived expressed himself so decidedly on the subject, that she, being a cat of a great deal of spirit, very naturally felt hurt, and concluded to seek a home where her talents would be appreciated.

It was very hard lines to have to leave a place where she had been so happy, and caught so many rats, and it was here that she gave Buff Anders such a good thrashing; and had she twenty lives instead of nine, there would not have been sufficient to crowd in all the pleasant recollections. And then, her feelings overcoming her, she exclaimed, "Shall it ever more be thus, spirits, still imperious. Shall we never fairly stand, soul to soul, hand to hand. Will the time never come, when women and cats may have their rights? Must they always be kept down and dictated to by Man, whose right lies in his might, simply because curiosity led a weak woman to eat of an apple, and politeness caused her to pass it around? It is not kind, it is"—but we never found out what it was, as just then Dom Pedro, a big yellow dog, appeared around the corner, and she had business in another direction. We heard afterwards that she had taken Mr. Greeley's advice and "gone West," but no further than West Philadelphia, where she was living in style on Chestnut street, and was giving open-air concerts with great success. Some of her operas met with striking applause, people going so far as to throw boot-jacks and shaving cases, as something more uncommon and complimentary than bouquets.

What she might have become had she continued, is only left for us to imagine, for while her star was at its zenith she suddenly disappeared. Some say she has gone on the "Star Course," others more evil-disposed, think that she has gone in search of a land where cats can have spring chicken, but I am under the impression that she has fallen a victim to one of the above-mentioned compliments, and I shall mourn for her as long as my name is, CAT-TER-INE.

LETTERS FROM BOYS AND GIRLS.

Seeds from the Rural Experimental Grounds.

RURAL COUSINS:—I promised, in the golden days of a by-gone summer, to tell you of our beautiful grape-vine, and what came of the seeds furnished me from the Experimental Grounds of the RURAL. To make good that promise I seat myself near a vine-covered window, and with my faithful friend, my good gold pen, try to write you another letter. More than a quarter of a century ago was our grape-vine planted (please do not think I did it). It was my mother who planted the tiny roots in the rich earth so long ago, close by the wall of the old brick homestead. Year by year it grew and lengthened, and in time its clinging branches almost met, after covering many yards of the four walls. Every year it gives rich purple-black clusters, and "we girls" have each a favorite spot from which to satisfy the mind with the beauty of the fruit among the green leaves, as well as satisfy the cravings of appetite. Now it is so full of green bunches, and by-and-by, when a few more weeks are claimed by time, we all enjoy our yearly treat once more And not only in the autumn time, but through the snow-decked months of winter are we cheered by the pleasant fruit. The way we keep it is as follows: The grapes are gathered before the frost touches them, and put in shallow boxes; first line the bottom of the box with grape leaves, then put a layer of grapes, then some more leaves and grapes until the box is full, finishing the top with plenty of leaves. Place in a cool, dry cellar: and that is all until the time for treating our friends comes. The fruit is then washed, carefully drained, and is found plump, pretty, and very palatable.

And about the seeds. The first we received were Pelargoniums and Double Hollyhocks, and these I divided with a friend. Of the former only two seeds germinated, and with all my attention and interest would not be grown in the right way, and finally gave up altogether. But the Hollyhocks! how nice they grew; and this was their year of bloom. The bright stalks of blossoms were very much admired, and we divided the flowers with our friends that others, too, might enjoy the beauty of the bloom.

Among other seeds sent at another time, and satisfactorily grown, are four bulbs of the Chinese Yam, (but their growth is very slow) one curious Shell Flower, and as the labels of some others are lost, I cannot tell what they are or what they are like, as they've not blossomed yet. I am well satisfied with what I obtained, and think it liberal in giving the seeds free of charge. And next time when the editors make known the *divide*, I mean to take advantage of that too, and, perhaps, but, oh! no, I must not anticipate that I shall write again in a flower-y way, for may not the kind owners of the seeds pass me over when that time arrives, thinking I've already received benefit enough? But that I trust is not to be, and with a good-bye to you all, I continue YOUNG FARMERINE.

Independence, Pa.

Lily Lee's Letter.

DEAR UNCLE TRUE:—I wonder what all the cousins are doing now-a-days. You do not seem to have as extensive a correspondence as you did before the summer came. I expect croquet and base ball, hunting and fishing, occupy all the spare time of the boys; but there are so many nice things for girls to do, that I wonder they do not tell us about them. Just think! one of our boys had been planting beans and he had worked all day, and in only a few minutes' spare time, which he had before milking, he went into the garden and cut a pæony in full bloom. It was a dark red one, but he brought it into the sitting-room to show us, and, just think, the edges of all the petals were snowy white! It was very pretty, and odd, too. We all wondered over it, it looked so curious. I saw mother look in his face and smile. She told us to smell of it, and see if we were sure it was a pæony. Then it came out what it was. The rogue had burned some matches under it, and bleached the edges of the whole flower. He is always experimenting on something to see what he can do. Last fall he got his fingers all stained with butternuts. Of course, he did not care if they were brown, but we girls did not like to have ours look so badly. He went out and burned some matches, and bleached his fingers all white; every bit of the stain came off, and then he came to the kitchen and told us how to take the stain off ours. We thought it was very nice, and cracked all the butternuts we pleased afterwards. I think brothers are the best things in the world. We are going to preserve some of our summer flowers, for bouquets next Christmas. Grandmother tells us how to do it. They are cut off at the roots, and buried in dry sand, and kept dry till we want them for use. I think it will be splendid to have roses and pinks in vases at Christmas, all fresh and bright. She used to preserve them so when she was a girl. How funny it seems, to think of dear grandmother ever being a girl like us, and doing just as we do now. I am learning to ride horseback this summer, and it is just delightful. I hope all the little girl cousins will learn to ride, too. It is the best fun in the world. Now, I would like to know what the other cousins are doing these bright, long summer days. I hope they will tell us, but I have written a long letter, so must close. LILY LEE.

Going Home.

WE are going, slowly going
To that peaceful, heavenly shore
Where the Father now is waiting,
And our trials all are o'er.

I have felt it in my longings,
I have read it in my dreams,
And a source of joy and gladness
To my weary soul it seems.

I have loved ones in yon heaven
Of the good, the pure, the best;
I shall see them when God wills it,
And my soul will be at rest.

W. B. JONES, Rochester, N. Y.

What is the Matter?

DEAR COUSINS:—Has the summer heat paralyzed your energies, or what can be the matter with you all? This department, which I always have thought to be the most interesting part of this most interesting paper, (and I beg the pardon of the managers of the other departments) seems to be dying for want of breath. I only see an occasional letter written with fear and trembling lest it should find a waste-basket grave.

Come on! Boys and girls let's write. Who's afraid of the waste-basket anyhow? Let's have some life here if a few letters do find their final resting-place too soon in life. W. B. J.

Rochester, N. Y.

He Made One.

DEAR UNCLE TRUE:—I am only eight years old. I live on a farm in central New York. My pets are a calf, a dog, and two cats. But one of the cats has a bad habit. She kills little chickens. I wish some of the Cousins would tell me, if they can, what would break her of it. I made a "Rural scouring-board" to-day. Perhaps you would not think it very nice, but mother says it is well made for such a little boy. L. H. C.

Sabbath Reading.

BELSHAZZAR.

TRANSLATED FROM HEINE.

THE midnight hour was drawing on;
Hushed into rest lay Babylon.

All save the royal palace, where
Were the din of revel, and torches' flare.

There high within his royal hall
Belshazzar the King held festival.

His nobles around him in splendor shine,
And drain down goblets of sparkling wine.

The nobles shout and the goblets ring
'Twas sweet to hear of that stiff-necked King.

The cheeks of the King, they flushed with fire,
And still as he drank his conceit grew higher;

And, maddened with pride, his lips let fall
Wild words, that blaspheme the great Lord of All.

More vaunting he grew, and his blasphemous sneers
Were hailed by his lordly rout with cheers.

Proudly the King has a mandate passed;
Away hie the slaves, and come back full fast.

Many gold vessels they bring with them,
The spoils of God's House in Jerusalem.

With impious hand the King caught up,
Filled to the brim, a sacred cup;

And down to the bottom he drained it dry,
And aloud with his mouth a foam did cry,—

"Jehovah! I scoff at Thy greatness gone!
I am the King of Babylon."

The terrible words were ringing still,
When the King at his heart felt a secret chill.

The laughter ceased, the lords held their breath,
And all through the hall it was still as death.

And see, see there! on the white wall, see,
Comes forth what seems a man's hand to be!

And it wrote and wrote in letters of flame,
On the while wall—then vanished the way it came.

The King sat staring, he could not speak,
His knees knocked together, death-pale was his cheek.

With cold fear creeping his lords sat round,
They sat dum-stricken, with never a sound.

The Magians came, but not one of them all
Could interpret the writing upon the wall.

That self-same night—his soul God sain!—
Was Belshazzar the King by his nobles slain.

[*Theodore Martin, in Blackwood.*

HOW TO OBSERVE SUNDAY.

THE question of the proper observance of Sunday has been a much disputed one, and is one of much interest. A certain amount of religious services should of course form a part of each Sunday's life; should indeed be its central idea, but it should not infringe upon the demands of overworked nature for rest. But what is rest? Clearly what would be rest to one would not be to another. What would increase vitality and strength to the day laborer would make the weary student, book-keeper or editor more weary. The work of the six week days, whatever it is, should be put entirely out of sight from Saturday until Monday. Mental labor—reading, writing or other employment that requires mental effort. Physical laborers must cease physical labor, and can obtain the desired rest in mental improvement. Those whose week days are spent within the four walls of a store or an office, should be in the open air, in the broad fields, where they can breathe nature's purest aerial draughts, as much as possible. Those who labor out of doors will find their greatest rest and enjoyment on Sunday in their homes. The business man and the banker should cease all thought of business, take a complete respite from all thoughts of "shop," and Sunday for all classes should be made as widely different from any other days in the week as possible. It should be made enjoyable, especially for the children, that they may grow up with the love of the day, instead of an aversion for it, as is too common even in the best of Christian families. The observance of the day in each household should be made a study, that the most profitable and rest-giving enjoyments to suit each case may be found, and then let the observance of the day, once settled, be lived up to as strictly as a business transaction. The day should have its distinctive features; religious culture; freedom from toil for servant as well as master; rest in its true sense, and enjoyment of the higher order, which relaxes the nervous system, and is one of nature's greatest restoratives, all have their place, and none of them should be neglected.—*Pittsburg Telegraph.*

THE gifts that Jesus Christ gives widen the heart and enlarge the soul of a believer to take in more of Himself. Naturally we are narrow-mouthed heavenward, and wide-mouthed earthward; but the Lord Jesus, by casting his jewls, his pearls, his precious gifts into the soul, doth widen, enlarge, and make it more capacious to entertain himself. Christ, by his gifts, causes all doors to stand open, that the King of glory may come in.

REMEMBER, Christians, how many there are in the world, who sit sighing and mourning under the want of those very favors that you enjoy.

Why does the living man complain? What, out of hell, and complain? This is a man's sin and God's wonder.

As earthly portions carry away worldly hearts from God, so when God once comes to be a man's portion, He carries his heart away from the world, the flesh and the devil. All the world can not keep a man's interest and his heart asunder.

PERSONAL ITEMS.

Beaconsfield rather favors woman suffrage.

General Grant will bend his steps towards Siam and the grand Indian tour before coming home.

Emperor William is taking mud baths at Teplitz, which are considered a very efficacious remedy for rheumatism.

Evangelist Moody has given $5,000 to Wellesly College, Mass., from the proceeds of the sale of the Moody and Sankey Hymn Book.

A. S. Packard, Jr., the well known entomologist, of Salem, Mass., will fill the new chair of Geology and Zoology in Brown University.

Ex-Doorkeeper Fitzhugh, the "biger man than old Grant," will re-open Willard's Hotel, Washington, as a resort for Southern people.

Henry Ward Beecher and Henry C. Bowen are joint executors of the will of Miss Mervida Wood of Brooklyn, just deceased. The will was made twenty years ago.

Dom Pedro has addressed to Captain "Jetty" Eads an autograph letter congratulating the engineer upon his exploits at the mouth of the Mississippi, and inviting him to visit Brazil.

Minister Bayard Taylor was at Friedrichshoda, in the Thuringia Wald, during his recent illness. His doctors forbade all reading, writing and brain work of any kind. He with his family, are now back at Berlin.

Ten years ago Major E. A. Burke, whom the Democrats of Louisiana have just nominated for State Treasurer, and who has lately been testifying before the Potter Investigating Committee, was a day laborer in a brick-yard.

James Douglas, of Caves, last male descendant of the hero of Chevy Chase, died the other day. In his house was preserved the banner under which his ancestors fought, and the Percy gauntlet, captured under the walls of New Castle.

It is now stated that the marriage of James Gordon Bennett's sister, Jeannette, to Isaac Bell, Jr., will take place in the Catholic church at Newport about the middle of September, and that Cardinal McClosky, who is now at that fashionable resort, will perform the nuptial ceremony.

Mrs. Clarinda Newell, of Stonington, Ct., has a tree toad which she has kept over a year in an open fruit jar. His toadship avails himself of a small ladder to ascend to the top whenever damp or rainy weather is near, where he sings as loudly as in native haunts. As a barometer he is a complete success.

Edward Fretwell, Marshal of Austin, Mississippi, cracked the side of his top-boots with a riding whip and boasted that he could lick the whole Evans family. On Monday Fretwell and a young Evans met in the public square at Austin, paced off ten short, quick strides, wheeled and fired simultaneously. Both men fell dead.

Like his father, King Humbert, of Italy, affects a familiar tone to his audiences. Not long ago he received a delegation of Professors from the University. To the Professor of Anatomy the King said: "Heaven keep me from falling into your hands!" and the Professor answered, "Amen! For your Majesty's sake and the country's."

Lord Dufferin, Governar-General of Canada, has just received by the English mail, from Queen Victoria, £10,000 sterling, her majesty's gift to Quebec for the construction of that portion of the Dufferin improvements to be called Kent Gate, after her father, Edward, Duke of Kent, who resided in Quebec for several years of his life.

Dr. Carver, the glass-ball rifle shot, spent a thrilling and throughly dime-novel youth. His father, mother, brothers and a sister were massacred by the Sioux in Minnesota, and he was taken captive to be brought up in the tribe. A life of nineteen years as a nomad with the rifle his most-loved companion, gave him the wonderful skill recently exhibited.

Robert Lincoln, son of Abraham Lincoln, has no idea of accepting a nomination for Congress in Chicago or anywhere else. When a young man in Washington he formed the opinion that it was unwise for a young man to enter politics as a profession. He has consistently followed this course and has repeatedly declined to accept office, whether State or national.

The Marquis of Hartington, leader of the British Liberal party, is forty-five years of age, perhaps five feet ten inches high. He has auburn hair, a brain of moderate size, features fairly harmonious, and is just a tolerably good-looking English gentleman. He is a Cavendish, the son and heir of the Duke of Devonshire, and is valuable to the liberal cause by reason of his rank and connection.

In 1850, when the tide of political passion was still running very high, Bismarck went one day into a tavern at Berlin to take a glass of beer. A man near him began to abuse one of the royal family. Bismarck looked at him, and said quietly, "If you have not left this room before I have finished my beer, I will break this pot over your head." He then emptied his glass very deliberately, and as the man took no heed of the warning, he did as he had threatened. He walked away leisurely without any one having dared to molest him.

In the quaint old Bryant cottage at Roslyn, L. I., one room remains sacred to the memory of the poet's wife, who died in it in 1864. Everything in the room is as she left it—the old mahogany high post bedstead, her writing desk on a table in the center, containing the stationery with which her last letters were written; on her bureau her toilet articles; in the closet her wardrobe—dresses, slippers and complete attire; and on the bureau a half-burned candle in a brass candlestick, standing where it illuminated her death chamber fourteen years ago.

Implements and Machinery.

THE McSHERRY

Force Feed Grain Drill

Is the Machine upon which you can always depend. It is very easily regulated and managed, and possesses every requisite of a perfect Grain Drill. Years of successful use, without change of feed arrangement or any essential part, with its constantly increasing sale, prove in arguments stronger than words that it is the best and most satisfactory Drill to buy.

It sows Fertilizers splendidly.

The McSherry Drill received Highest Awards at the Centennial.

HELP!

FOR THE WEAK, NERVOUS AND DEBILITATED!

The afflicted can now be restored to perfect health and bodily energy, at home, without the use of medicine of any kind.

PULVERMACHER'S

ELECTRIC BELTS

AND BANDS,

For self-application to any part of the body, meet every requirement.

The most learned physicians and scientific men of Europe and this country indorse them.

These noted Curative appliances have now stood the test for upward of thirty years, and are protected by Letters-Patent in all the principal countries of the world. They were decreed the only Award of Merit for Electric Appliances at the great World's Exhibitions—Paris, Philadelphia, and elsewhere—and have been found the most valuable, safe, simple, and efficient known treatment for the cure of disease.

READER, ARE YOU AFFLICTED?

and wish to recover the same degree of health, strength, and energy as experienced in former years? Do any of the following symptoms or class of symptoms meet your diseased condition? Are you suffering from ill-health in any of its many and multifarious forms, consequent upon a lingering, nervous, chronic or functional disease? Do you feel nervous, debilitated, fretful, timid, and lack the power of will and action? Are you subject to loss of memory, have spells of fainting, fullness of blood in the head, feel listless, moping, unfit for business or pleasure, and subject to fits of melancholy? Are your kidneys, stomach, or blood, in a disordered condition? Do you suffer from rheumatism, neuralgia or aches and pains? Have you been indiscreet in early years and find yourself harassed with a multitude of gloomy symptoms? Are you timid, nervous, and forgetful, and your mind continually dwelling on the subject? Have you lost confidence in yourself and energy for business pursuits? Are you subject to any of the following symptoms: Restless nights, broken sleep, nightmare, dreams, palpitation of the heart, bashfulness, confusion of ideas, aversion to society, dizziness in the head, dimness of sight, pimples and blotches on the face and back, and other despondent symptoms? Thousands of young men, the middle-aged, and even the old, suffer from nervous and physical debility. Thousands of females, too, are broken down in health and spirits from disorders peculiar to their sex, and who, from false modesty or neglect prolong their sufferings. Why, then, further neglect a subject so productive of health and happiness when there is at hand a means of restoration?

PULVERMACHER'S
ELECTRIC BELTS AND BANDS

cure these various diseased conditions, after all other means fail, and we offer the most convincing testimony direct from the afflicted themselves, who have been restored to

HEALTH, STRENGTH, AND ENERGY,

after drugging in vain for months and years. Send now for DESCRIPTIVE PAMPHLET and THE ELECTRIC QUARTERLY, a large Illustrated Journal, containing full particulars and INFORMATION WORTH THOUSANDS. Copies mailed free. Address,

Notre Dame, Ind.
Under the Direction of the Sisters of Holy Cross.

The course of studies is thorough in the Classical Academical and Preparatory Department. *No extra charges for French or German, as those languages enter into the regular course of study.* The MUSICAL DEPARTMENT is conducted on the plan of the *best* Conservatories of Europe. In the ART DEPARTMENT the same principles which form the basis for instruction in the great Art Schools of Europe are embodied in the course of DRAWING and PAINTING. Pupils in the Schools of Painting and Music may pursue a special course. Those who have passed creditably through the Academic and Classical course receive the Graduating Gold Medal of the Departments. Graduating medals are awarded to students who have pursued a special course in the Conservatory of Music or in the Art Department. Gold Medal for German, presented by Rt. Rev. Bp. Dwenger, Fort Wayne. Gold Medal for Domestic Economy, presented by Rt. Rev. Bp. Gilmour, Cleveland, Ohio. Gold Medal for French, presented by Very Rev. E Sorin, Sup. General of the Order of Holy Cross. Gold Medal for Painting and Drawing, presented by Dr Toner, Washington, D. C. Gold Medal for Christian Doctrine, presented by Mrs. M. Phelan, Lancaster, Ohio. Number of Teachers engaged in Preparatory, Academical and Classical Departments, 14; Modern Languages, 6; Drawing and Painting, 5; Instrumental Music, 10; Vocal Music, 2; Dress-making Plain and Fancy Needle-work, 7.
Simplicity of dress enforced by rule. For Catalogue address MOTHER SUPERIOR,

TO ADVERTISERS! We fill orders for the insertion of advertisements in the newspapers of the United States and Dominion of Canada. To furnish advertisers with reliable information concerning newspapers and their rates, and thus enable the most inexperienced to select intelligently the mediums best adapted to any particular purpose, WE ISSUE SEMI-ANNUAL EDITIONS OF

AYER & SON'S MANUAL

FOR ADVERTISERS, 164 8vo. pp. Gives the names, circulation, and advertising rates of several thousand newspapers in the United States and Canada, and contains more information of value to an advertiser than can be found in any other publication. All lists carefully revised in each edition, and where practicable prices reduced. The special offers are numerous and unusually advantageous. It will pay you to examine it before spending any money in newspaper advertising. The last edition will be sent postpaid to any address on receipt of 25 cents by N. W. AYER & SON, ADVERTISING AGENTS, Times Building, Philadelphia.

Wit and Humor.

THE following two sets of week-day rhymes are common in the North of England :—

Monday's bairn is fair of face,
Tuesday's bairn is full of grace,
Wednesday's bairn is full of woe,
Thursday's bairn has far to go,
Friday's bairn is loving and giving,
Saturday's bairn must work for his living,
But the bairn that's born on Sunday
Is brisk, bonnie, wise and gay.

AGAIN,

Born on Monday will have health,
Born on Tuesday will have wealth,
Born on Wednesday will have good luck,
Born on Thursday will meet with losses,
Born on Friday will meet with crosses,
Born on Saturday will do no good,
Born on Sunday has nothing particular.

AN editor who has been married but a few days, inquires seriously, "Is civil war eminent?" This looks bad.

A RECENT issue of the Detroit Free Press contained an advertisement of "For Sale —A piano by a lady with modern legs."

SCIENCE says that it took millions of years to evolve man from the oyster; observation shows that it takes less than a minute to transfer the oyster to a man.

"I WISH to be a friend to the friendless, a father to the fatherless, and a widow to the widowless," said a gushing speaker at a recent revival meeting.

"FINE nainsook, embroidered, makes lovely slips for children," says a fashion writer. Orange peel on a sidewalk continues o be good enough for men.—*N. O. Picayune.*

SWELL: "I want you to make me a short coat, without tails or seams in the back. Do you know what I mean?" German tailor: "Yaas, yaas; I know vat you vant. You vant a strait-jacket."

HE gave her a hearty smack. "Don't kiss like that," she said. "I want a sweet, tender pressure when I'm kissed. I don't want any fireworks." He left out the explosion in the next act.

Two lawyers, while bathing at Santa Cruz the other day, were chased out of the water by a shark. This is the most flagrant case of want of professional courtesy on record.—*San Francisco Post.*

A WAG in New York seeing a man driving a tack into a card, through the letter "t" of the word "Boston" printed on it, seized the latter and exclaimed; "Why, what are you about: don't you know that laying *tax on tea in Boston* once raised a thundering muss there?"

A JUDICIOUS instance of punning upon a name once took place in a judicial court of New York, which is thus told: Counsel had been questioning a certain witness named Gunn, and in closing he said to him, "Mr. Gunn, you can now go off." The judge on the bench, seeing the pun, gravely added, "Sir, you are discharged." Of course an explosion in court immediately ensued. —*New Haven Register.*

ON the Fourth a native American was upbraiding a naturalized German for celebrating the day so enthusiastically. The German replied, "You, sir, are an American from necessity; I am one from choice. And besides, sir, when you came into the country, you hadn't a stitch of clothing upon your back, while I was comfortably clad." The American has been thinking about it ever since.—*Turners Falls Reporter.*

IRISH BULLS.—Mr. D., an Irish gentleman well-known in New York, was lately invited to dinner by a wealthy Scotch resident, at whose generous table he met a number of his host's countrymen. The conversation turned on Irish bulls, of which one and another of the company reported several, until the table was in a roar. The Irish guest kept quiet until his patience was exhausted, but at length blurted out: "Say, Mr. C., an' do you know what I think?" "Why, indeed, what do you think, Mr. D.?" "Shure, sir, an' do you know that I think, indade, that not more than one-half of these lies that they all tell about the Irish are true." This unintended contribution to the subject brought down the house.

A Tried Remedy for Biliousness.

Those who suffer from disorder or inaction of the liver will never get the upper hand of the unruly organ so long as they use such irritational remedies as blue pill, calomel and podophyllin. But from the tried and popular medicine, Hostetter's Stomach Bitters, they may expect relief with a certainty of obtaining it. The influence of the bitters upon the great biliary gland is direct, powerful and speedily felt. The relief afforded is not spasmodic, but complete and permanent. The sallowness of the skin, furred appearance of the tongue, indigestion, costiveness, headache, nausea, pains through the right side and shoulder, in fact every accompaniment of the obstinate complaint are entirely and promptly removed by a course of this inestimable medicine, in behalf of which testimony is constantly emanating from every quarter and from all classes of society.

NEW STRAWBERRIES.

DR. F. M. HEXAMER.

THE large number of new strawberries annually introduced and offered for sale at high prices, obliges the specialist in this branch of Pomology, to invest a considerable amount of money in plants and to devote much time and labor to the observation and study of their merits. Few varieties succeed equally well over a large extent of country and in different soils; and but a very small percentage of seedlings, however desirable in the place of their origin, retain their merits when planted elsewhere. Of the hundreds of seedlings which I had on trial, all of which were, by their originators, considered superior to anything ever grown, hardly ten per cent. proved to be worth cultivating.

Nearly all new varieties, when first offered for sale, have been grown on the place of their originators only, where they have been watchfully guarded by day and by night, cultivated and stimulated to the utmost extent, judiciously watered with solutions of special fertilizers, the fruit-stalks tied up and the blossoms and fruit thinned out so as to leave only the largest and most perfect berries to ripen for exhibition specimens. Can it be surprising that the uninitiated who buy such plants, expecting to harvest such Premium berries, will be disappointed and that even the practical cultivator, who reads descriptions of new varieties and their promising excellences, with some grains of allowance, has about as much chance to escape disappointment as he has to draw the great prize in the lottery? Yet the fact remains that unless we try for something better we can never get it, and it is only by comparing the experiences of growers in different localities that we can determine the general value of new varieties. With me, on a medium clay loam, the

GREAT AMERICAN (13), makes a very strong growth, bears a fair crop of large, handsome berries of rather indifferent quality. It ripens very late, which is one of its principal advantages. To develop its best features and produce berries of *fourteen inches* in circumference, as was a berry exhibited at the last exhibition of the New York Horticultural Society, require more skill and care than most growers are able to give.

PRESIDENT LINCOLN is not yet fruited on my own grounds, but plants grown only a few miles from here, under good but not extraordinary culture, on soil similar to mine, produced more uniformly large berries—some of them measuring eleven inches in circumference—than any variety I have ever seen or heard of. The berry is bright-red, glossy, very handsome, moderately firm and of very good quality; the plant is a very strong and healthy grower.

CRESCENT (16)—(Parmelee's Crescent Seedling.) In this variety the climax of productiveness seems to have been reached. From plants set out this spring, I have picked more berries than from many others a year old; and on the original place 15,000 quarts of berries were picked from one acre of ground. Of good size, handsome shape and color, fair quality, enormous productiveness and extraordinary vigor of growth—even under the most slovenly cultivation and on a great variety of soils—the "Crescent" seems really destined to become the "Strawberry for the Million."

FOREST ROSE (17,) originated in Ohio, where it had extensive trials and was, by competent judges, pronounced "one of the very best strawberries known." At the East it has had as yet but limited trials. The fruit is large, obtuse, conical, moderately firm, of good quality and light-red color, too pale, I think, for a market berry.

SHARPLESS' SEEDLING (15)—Unlike other new varieties, this one, previous to its being offered for sale, has had fair trials in several localities, and wherever grown has given most satisfactory results. I have not yet fruited it on my own grounds, but from the fact that, by the highest authorities, it was pronounced: "the largest and best strawberry in cultivation," I have no doubt that it will prove of great value.

Of the newer varieties which have been grown more extensively, sufficiently to enable us to determine their merits—

DUCHESSE (2) has proved to be a most valuable early variety, ripening with the earliest and holding out well. Its berries are uniformly large and well shaped, of good quality and color; the plant is very prolific and hardy and succeeds well in a great variety of soils and climates. No other early variety combines as many desirable qualities.

CUMBERLAND TRIUMPH (3) is a very large, pale, and juicy berry, too soft for even a near market, but for home use—on account of its great productiveness and size—it is a desirable variety.

CAPTAIN JACK (4.)—This is an immense bearer, much more so than Wilson, which it resembles in appearance but excels in quality and firmness. Were it not for its size, which averages below Wilson's, it would no doubt become the most profitable market variety.

PROUTY'S SEEDLING (5) is not as much known as it deserves to be. It is certainly one of the most handsome berries grown, of a peculiar elongated, conical shape, large size and excellent quality. With me the plant is vigorous and productive. On the table, few varieties present as beautiful and striking an appearance.

DUNCAN.—Very early, very productive and of good flavor. Too soft and pale for market.

STERLING, STAR OF THE WEST and several other highly recommended novelties refuse to bear, with me, enough even to give a fair taste of their qualities.

BEAUTY, CENTENNIAL, PIONEER, BELLE, CAROLINE and many others have still to be classed among the promising ones, but it is doubtful whether any of them will ever come up to expectations and produce satisfactory crops, outside of their originators' grounds.

WILSON, TRIOMPHE DE GAND. With all our grand array of new varieties—and I have named only the most prominent ones—have we a better market berry than the Wilson or the Triomphe de Gand. The almost unanimous answer of fruit-growers will be decidedly in the negative. And how many of them have actually proved to be better for general cultivation than Charles Downing and Seth Boyden? The number is exceedingly small.

MONARCH OF THE WEST will probably, for many years to come, be classed among the standard varieties. Although it does not succeed under as varying conditions as Wilson or Charles Downing, yet it has so many good qualities that it must be classed among our best varieties for home use and a near market.

DUCHESSE is a decided acquisition and will, undoubtedly, be planted in preference to other early varieties.

BLACK DEFIANCE and COL. CHENEY are both good amateur varieties, but too uncertain for general cultivation.

Obviously there is yet much room for improvement in strawberries, if not in size, then in texture and quality. Based upon the experience of the past twenty years, I am inclined to accept as a rule, that of all the new varieties produced during one decade, not more than two or three will survive the next one.

Westchester Co., N. Y., Aug. 1, 1878.

STRAWBERRY CULTURE.

J. C. WILLIAMS.

INFLUENCE OF LOCALITY ON CHARACTER.

WE are frequently asked what variety of strawberry we would plant for our own use, and we reply, "We don't know."

Many sorts possess individual merits and have become like so many friends, each having some good qualities, and to retain but one to the exclusion of all others, would be a truly unpleasant separation. No one variety will succeed equally well in all sections, and therefore we cannot commend *any one* as possessing all the requisites of a perfect berry. Some will prove valuable over a greater extent of country than others, like Wilson's Albany, and Charles Downing, both of which have, in reality, become public favorites, while even these are in some sections nearly worthless. Some that on our grounds are very desirable, are not worth growing on places within a mile of us, and *vice versa*.

Some do well if allowed to run freely, forming a matted row or bed, while others need keeping in hills or single rows, by clipping off all runners. With us, Wilson, Downer's Prolific, Champion, Crescent, etc., give good results on the former system, while Seth Boyden, Great American and Beauty are notable failures except on the latter.

VARIETIES.

THE DUNCAN, for earliness, fine flavor and productiveness, we regard as eminently desirable. It is probably too soft for a distant market, but for home use no collection should be without it.

CHARLES DOWNING, for home use or near market has few superiors. Its large size and beautiful, bright color, make it specially attractive, while in quality and productiveness it is hard to beat.

SETH BOYDEN retains its popularity as a market sort, more for its large size, productiveness and solidity, than for beauty or quality. Being rather dry-fleshed, it will bear without injury more careless handling in transportation than most others.

MONARCH OF THE WEST also bears carriage well, and but for the green, seedy end of nearly every berry, which gives them the appearance of being unripe, this variety would prove a rapidly-selling sort, being of very large size and of a bright, glossy color. For vigor of growth and quality of fruit this may be commended, but on our grounds it is too shy a bearer to grow with any satisfaction. Its popularity as a marketing berry, in southern New Jersey, would seem to indicate its being better adapted to a sandy soil, ours being a moderately stiff loam and quite stony.

CUMBERLAND TRIUMPH AND SPRINGDALE, both yield a liberal quantity of large, handsome and fine-flavored fruit, but are too soft for any but a near home market.

GREAT AMERICAN AND BEAUTY have doubtless disappointed many. That they will do well grown in matted rows and with but ordinary cultivation, I do not believe. Having been brought up by the most thorough culture, together with the use of an abundant supply of manurial elements for their perfect development, anything short of these conditions will lead to either partial or entire failure. With a like amount of care and attention to what they receive under Mr. Durand's management, we know of no reason why, with favorable conditions, they should fail to give satisfaction.

CRESCENT SEEDLING, proves to be a slender grower, but a free runner, and is well adapted for growing thickly, or on the matted-row system. Its claims for productiveness seem well founded, and, as quantity is more essential than quality in a market strawberry, the Crescent will doubtless become popular. In size and flavor, however, I am obliged to say that I see but little to commend it. Perhaps with another, and a more favorable season, I may have reason to change my opinion.

SHARPLESS AND FOREST ROSE, are berries of which I expect to report most favorably another year. Offered with the indorsement and commendations of noted and trustworthy pomologists, I indulge strong hopes that these varieties will prove really valuable acquisitions.

In the enthusiastic attention given to new varieties, some of the older sorts which have positive merits, are overlooked and forgotten.

THE CHAMPION, we believe to be one of this number, ripening an abundant yield of fruit late in the season, when most others are nearly done. Berries are of medium to large size, somewhat acid, but of a sprightly, pleasant flavor. We shall plant it more largely, believing it will prove remunerative.

ADVICE TO PROSPECTIVE STRAWBERRY GROWERS.

We would advise those who contemplate growing berries for market, to purchase a few plants of several of the most promising kinds, and fruit them on their own soil for one year at least, carefully noting the character and habits of each. The practical knowledge thus obtained will prove of much value, and save many dollars as well as disappointments. Of late years it has been only the large and choice fruits, that have yielded the grower much if any profit, and this can be had only by thorough culture and liberal fertilizing.

Probably well rotted barn-yard manure, well worked through the soil before planting, followed by a winter top-dressing of the same, will give as good results as anything. Not having tested any of the chemical manures prepared specially for fruits, we are unable to speak of their value.

Montclair, N. J.

STRAWBERRIES:

NOTES ON SOME OF THE NEW VARIETIES.

J. T. LOVETT.

ALTHOUGH there is perhaps no fruit that is found growing, with more or less success, over so large a portion of the globe as the Strawberry, yet there is none over which soil, situation and the season have greater influence. There are a few varieties that will succeed everywhere, others in certain soils only. So many are there of the latter class, that those that are generally valuable may be considered the exceptions rather than the rule. Then, again, there is an astonishing diversity of opinion as to the standard of excellence in a strawberry. Most persons consider Triomphe de Gand as that standard, yet I know an authority—and he *is* an authority—who considers it scarcely fit to eat; while, on the other hand, the Wilson is by most persons considered scarcely fit to eat, yet I know some who consider it without an equal. This matter of flavor varies with one's taste for sweet or acid fruit. For myself, I prefer a mingling of the two- a sort of lemon-ade character of flavor, and shall describe the following varieties accordingly. Wilson I consider entirely too tart—Agriculturist too sweet and insipid; while Monarch of the West and Charles Downing I call very good. These notes, where not otherwise stated, are taken from berries grown on good loamy soil—not at all light, and yet having no trace of clay—what would be considered first-class garden soil.

CENTENNIAL FAVORITE OR NEW No. 14.—From its behavior with me, it would seem that this variety has been very much over-estimated. Plant, a rather feeble grower and a poor yielder. Berries medium-sized and of excellent flavor, after one can be found to ascertain what that flavor is. It would perhaps do better on a heavy, deep, moist soil.

CINDERELLA.—As I saw this in its original home, a sandy slope, it is certainly a superior variety. Berries large, conical and regular, bright, glossy scarlet, with a large light-green "burr," making it, in the crate, one of the handsomest berries I have ever seen. It is also firm and of excellent flavor. Plant, an unusually strong, vigorous grower and moderately productive. With me the plant is one of the best growers, and I am of the opinion that it will prove of considerable value generally. It ripens quite early.

CONTINENTAL originated by the same gentleman as Cinderella, Mr. Oscar L. Felton, of Camden Co., N. J. In size and firmness it is about the same as Cinderella, rather late in ripening, and too dark in color to be attractive. Mr. Felton claims great productiveness for it, but the crop, he says, was damaged much this year by the frosts of May 10th and 11th—seeming less hardy than Cinderella. To my taste it is not of such good flavor as Cinderella, although a good grower on Mr. Felton's land and with me.

FOWLER'S SEEDLING.—A strong, robust grower and productive. Berries, medium to large, bright scarlet; seeds deeply imbedded, very soft and of poor quality—lacking character of any kind.

RUSSELL'S ADVANCE is really very early. Berries quite large, bright and of attractive color and fair flavor, but too soft for market. Plant, a good grower, free from disease and productive. A valuable variety for amateurs.

GREAT AMERICAN, Fig. 13, has with me been almost a failure, and I saw large patches on light land, that might be considered total failures. The plant lacks vigor, being feeble, and has the habit of the outer leaves turning to a bronze color and losing vitality. Berries few and far between and, to my surprise, quite small, only rarely one being found as large as a good-sized Monarch. As I saw it at Irvington, it surpassed any Strawberry I ever saw for size of fruit and plant, and was enormously productive. But I believe it only possible to bring it to that state of perfection by one who has devoted a life to the study and practice of the art of stimulating the Strawberry.

DURAND'S OR ESSEX BEAUTY, Figs. 12-14.—I agree with a correspondent of the RURAL, Mr. C. W. Idell, in pronouncing this the gem of Mr. Durand's collection. It has proved to be of large size, handsome, moderately firm, of good flavor and productive. I regret to state, however, that it, too, seems to be losing vigor of plant, although not to the extent of most of the others of Mr. Durand's seedlings. Like the Black Defiance, it is inclined to stool and send out but few runners. Large size, productiveness and *beauty* are its merits.

PIONEER.—This is receiving considerable comment at present, but I fear it will be of short duration. The plant is of strong growth with large leaf and tall leaf-stalk as yet, and productive. The berry is too light in color, to my palate lacks character, and I shall be surprised if it does not prove too soft for market. It resembles Agriculturist in plant and character of berry, and it is doubtful if it will prove superior to it.

MINER'S GREAT PROLIFIC.—I am greatly pleased with this variety; plant, a very vigorous grower, with large, rich, clean foliage, and exceedingly productive. Berries large to very large, regular deep crimson, of a rich aromatic flavor, juicy and moderately firm; ripens late, and holds out until very late. Its popularity seems to have been retarded by its being first offered for sale when the strawberry-growing public was inflated with Great American, but I believe it has a great future and will win honor for its originator, whose name it bears.

PRES. LINCOLN.—This has not yet fruited with me, but it is scarcely worth while to say it is one of the very largest strawberries that has yet been produced. I am happy to be able to report that the plant is a good, vigorous grower in Jersey, even on light land, and promises much value.

FOREST ROSE, Fig. 17.—For two years this has been the best of the large berries with me. Early, very large, conical, bright crimson, of splendid flavor, handsome, and exceedingly firm. Plant a very robust and vigorous grower, and productive, but alas! it rusts and burns. It has not only been affected in this respect but badly for the past few weeks. It may be owing to the excessive rain followed by hot sunny weather, and *may* not do it again. I had great hopes for this berry, believing it to be a variety of decided merit, and so it is if its foliage will remain healthy and vigorous.

* Beauty is sometimes irregular in shape, as in fig. 1. It is oftener as in fig. 12 or 14.

CRESCENT SEEDLING, Fig. 16.—I have no earlier berry than this, never saw a strawberry that could produce anywhere near so much fruit, or a more healthy, luxuriantly-growing plant. I cannot decry this variety though others may, for it has so many good points, although, like the best of us, it has some weak ones. Like the Concord grape, if you plant the plants, you will have fruit with very little after trouble, and, although not the best, there will be plenty of it, which to many is far better than none. Whether this is as it should be, or whether people who are not willing to give the best varieties the small amount of culture they require, are deserving of any at all, I will not attempt to argue, but taking human nature as it is, I believe Crescent will be of value in the reduction of doctors' bills, and the saving of medicine, if nothing more. Besides, it is not an inferior variety, according to my way of thinking. It is above medium in size, a portion of the berries being large, and of bright, attractive color. It is, very true, not very firm when fully ripe, but as much so as Chas. Downing, and, like the Wilson, it colors before it is ripe, and can then be marketed without difficulty. It possesses the quality of "standing up" well, and retaining its color for a long while after being picked. Unless my palate is very much at fault, the flavor too, when *ripe* is, as Dr. Thurber said of the Duncan, "more than fair, it is *good*." When it has just turned and is *not* yet ripe—Oh my! it is not sour; it is not sweet; it is—— very much like a piece of raw pumpkin.

EARLY ADELA.—Has disappointed me, being rather small, not especially early or productive, and of indifferent flavor. In fact it showed no special merit in any particular, although I should add, it did not have a very good chance, and may do better another year. Plant a strong grower and healthy.

SHARPLESS.—Was the largest and handsomest berry I fruited, and the plant is the most robust grower I have ever grown. Having only plants set in, in the spring, I could not determine as to its productiveness, but it indicates great excellence in this respect also. Berries oblong, quite often irregular and flattened, rich crimson with a smooth glossy surface, and very pretty; flavor good to very good. There is a whisper that this variety will not ship well, but judging from the berries, it appears decidedly firm, and cannot be other than a good shipper, unless like Col. Cheney, it should bleed badly during transportation. From this, the first year, I deem it by far the best very large berry I have yet seen.

GLENDALE.—This promises much as a *late* berry, being very large, very late, and very firm. Flavor very good, and plant a strong grower and healthy. Fruit stalks, however, are quite short, requiring thorough mulching in order to have clean fruit.

STAWBERRIES FOR THE FAMILY.

E. J. BROWNELL.

I WISH I could demonstrate to every reader of the RURAL how easily he can produce a supply of this most delicious of all the small fruits, for it seems to me that if it were generally known with what a small outlay of time and labor it can be done, strawberries would be more commonly found in the kitchen garden. Many have been deterred from planting a strawberry bed, because they supposed it such a formidable task to take care of them. Now, although strawberries will unquestionably pay for thorough culture, and I would not be understood as recommending that they should be slighted, still, I do argue, after considerable experience with them, both in the kitchen garden and nursery, that—if you will take the trouble to renew a plantation yearly, and give it fair, ordinary culture through the season, as much, for instance, as you ought to be willing to give any garden crop—there is nothing which will give better returns. Indeed, I am not sure but that, where land is less an object than labor, this is, all things considered, the more profitable course; that is, more so than continuing the bed for some years on the same ground. By having the land in good condition and planting in rows, about two and a half to three feet apart and ten or twelve inches in the row, then letting the plants run together in the row, thus forming a matted row, we get a good yield the second season—that is, provided we have taken good care of them the first season—without giving them any special culture this second year except to pull out the largest weeds. Moreover, by planting a new bed annually, we can keep a bed in bearing year after year continuously.

As to the best season for planting; although I would prefer a bed planted last spring rather than one set out this fall, still, I would much rather have one started this fall—unless where the winters are very severe—than one planted next spring; for, planting this fall, we get quite a crop next season, and a full crop the season thereafter, with no additional labor. In reference to varieties: The Wilson still heads the list for hardiness and productiveness, though inferior to many in quality. In this respect the Triomphe de Gand is excelled by none, and on a strong, heavy soil, it is very productive. Charles Downing succeeds well with me, and is a great favorite.

Delaware Co., N. Y.

STRAWBERRIES.

WILLIAM PARRY.

LARGE CROPS.

The season just past has been a beautiful one, and thousands of bushels of strawberries have been daily carried from the country to the large cities, sold at fair prices and the proceeds sent back to gladden the hearts of the growers and help to bridge over the dull times. The Delaware Railroad alone, carried from May 6 to June 13, last, 637 car-loads, averaging 267 crates, or 8,000 quarts of berries to each car, making a total of 5,096,000 quarts, equal to 159,250 bushels of strawberries. Some idea of the extent of the Vineland, N. J., berry crop may be gathered from the fact that at one cent per quart, the pickers, this season, have been paid more than $7,000. The strawberry and blackberry crop, up to July 20, had netted $50,000, and about $5,000 a week was still being received at that date from the last-named berry.

The Monarch of the West yielded here at Pomona Nursery, on June 15 and 18, two pickings, 2,992 quarts per acre. One woman picked sixty quarts in two hours, or at the rate of a quart every two minutes, being nearly a bushel per hour. One of my neighbors had ten acres in strawberries this year, from which he gathered, some days in June last, four shelving loads of berries per day, and in all, 39,800 quarts or 1,244 bushels, which, sold at eight cents per quart, brought $3,184. They consisted mainly of Albany, Jucunda, and Cumberland Triumph. Some of them yielded at the rate of $1,000 per acre. Another neighbor near-by had seven acres of strawberries, consisting of Monarch of the West, Turner's, Cumberland Triumph and Charles Downing, which yielded 35,000 quarts. Being all large varieties they may be safely put at ten cents per quart, which would give $500 per acre, or $3,500 for the lot.

IMPROVEMENTS.

Perhaps there is no branch of fruit culture in which there has been greater advance made in size and quality of fruit, than in the strawberry. If we were to compare the little berries grown a few years since with the Monarchs and Triumphs of the present day, we could hardly recognize them as belonging to the same species. Scientific hybridization, combining large size, best quality, firmness of flesh and great productiveness, has produced the most favorable results, and if some law could be passed to protect those who have given to the world new and valuable fruits, and place them on an equal footing with the authors of good books, it would be an act of justice.

NECESSITY FOR LOCAL SELECTION.

Strawberries are local in their habits, and those best adapted to one section may not do so well in another. Persons about to commence growing strawberries should try at least a dozen of the best varieties, so as to be sure and get those most suitable for their soils and locations, and any that do not succeed with them may be dropped from the list. By now procuring plants already established in pots, which can be transplanted with safety, they can see the fruit next June and form a better judgment what kinds to plant more largely, than without that knowledge.

GOOD VARIETIES.

I will name a few that have done well here, from which a selection can be made for trial:

BLACK DEFIANCE—Early, large and luscious.

DUCHESSE—Very early and large.

BEAUTY—Large and handsome.

CENTENNIAL—Very fine flavor.

CRESCENT SEEDLING—Wonderfully productive, more easily grown with less care than any other strawberry that I have seen. Fruit medium size, bright scarlet color, red all over, as soon as ripe.

CHARLES DOWNING—Good standard variety,

CUMBERLAND TRIUMPH—Very large, handsome and productive. Good for near market.

MONARCH OF THE WEST—Very large and showy.

MINER'S GREAT PROLIFIC—Large, productive and vigorous. The originator being recently deceased, has left a valuable berry to perpetuate his name; let every fruit-grower try to do as well.

CAPTAIN JACK—Is giving the old Wilson a close contest, being as productive and of better quality.

GREAT AMERICAN—Very large and productive, where soil and climate are suitable.

GOLDEN DEFIANCE—Large, late and productive.

KENTUCKY—One of the best very late berries.

PIONEER—Very large, firm and beautiful.

SHARPLESS' SEEDLING—Last but not least, and so far as tried in Pennsylvania, New York and New Jersey, it bids fair to surpass all others in size, quality and firmness of flesh. Being productive and hardy, it succeeds well on both light and heavy soils. It is reported that one specimen measuring twelve inches, or more, has been sent to Paris for exhibition there. Having fruited it two seasons, we esteem it worthy of the highest praise here, and think it will give general satisfaction elsewhere.

Cinnaminson, N. J.

THE STRAWBERRY'S CHIEF NEED

THE impression is still very prevalent that the strawberry prefers to all others, a light, sandy soil. As a rule, such soils are very dry, and plants growing thereon are quickly injured by drought. This erroneous impression, which has been brought to my attention several times of late, reminds me of a very enjoyable conversation that I had with the Hon. Marshall P. Wilder of Boston, not very long since. As I remember it, he said that some one had written to him asking what was the chief requirement for successful strawberry culture. He replied in substance:

"In the first place, the strawberry's chief need is a great deal of water.

"In the second place, it needs more water.

"In the third place, I think, I would give it a great deal more water."

According to my experience this piquant way of putting the truth is scarcely an exaggeration. Bear in mind, there must be thorough *underdrainage*. No water must stand and stagnate on the surface or just under it. This is always ruinous. But having secured proper drainage, then the moister the land the better.

Cornwall-on-Hudson. E. P. ROE.

CONDENSED EXPERIENCE WITH STRAWBERRIES.

THE GREAT AMERICAN and BEAUTY on Durand's place are truly wonderful; on mine, however, they have not amounted to much, for my whole crop, this year, is almost a total failure; yet this really affords no criterion of their merits. I have great hopes of the Beauty, if it gets the same high culture Durand gives it, but I have little hopes of either when given only the broad-cast field culture that berries generally get.

DUCHESSE I have not tried; but I saw it at Woolson & Co.'s last year, and was not favorably impressed with it. I again saw it at Hance & Son's this year, and it looks better.

CUMBERLAND TRIUMPH is of good size and color, of fair quality and tolerably productive.

SPRINGDALE is, however, of better quality than Cumberland Triumph and more productive, besides being large and handsome.

CAPTAIN JACK I saw at Hance & Son's. It was very late and did not seem to set much fruit.

PROUTY'S SEEDLING.—If the conduct of small fruit during this erratic season, will at all serve as a basis for an opinion, I should think favorably of this variety. It is very productive, and the berries are of good quality. It lies almost too close to the ground, however, but the use of fertilizers may push it up a little.

BELLE DE LYONS.—I saw this also at Hance's, and as he has it from B. M. Watson, it is unquestionably Boyden's No. 30.

DUNCAN.—This is earliest of all strawberries, and last year, on my grounds, was best of all in point of quality—so said scores of visitors. This year from three-quarters to seven-eighths of the crop is a total failure, caused by frost, rain, rot and blight. On the whole I think three-quarters of my entire crop, of all kinds, was a total loss. It has been the most disastrous season for strawberries I have ever known. Any varieties, to withstand such a season successfully, must be iron-clad. Durand claims that his Beauty is so protected. A FRIEND.

Essex Co., N. J.

NOTES FROM THE RURAL GROUNDS.

STRAWBERRY REPORT

THE attention and care which we have given to Strawberry culture, for the past two years, would probably have resulted in full crops from many different sorts during the season just past, had it not been for the severe frost which blighted many flowers, then either in full bloom or "gone to seed." That a given variety will do well here is not proof that it will do well in many other places. But the fact may be considered as one link in the chain of circumstantial evidence.

Of all the new sorts none has raised higher expectation than

DURAND'S GREAT AMERICAN.—Its high-sounding name, the great size it has been known to attain under circumstances which, in the light of general experience, must be deemed "peculiar;" the labor which, for years, its producer is known to have given to crossing varieties and to seedling cultivation, have created these "great expectations." With us the berries were not of extraordinary size; the flavor was inferior, and the vines were not unusually productive. Fig. 13 is a portrait of our largest berry.

DUCHESSE.—This proved with us the earliest to ripen of any variety under test; very productive. The average size is that of fig. 2 in our illustration. It promises to be one of the best early varieties. It is not so firm as Wilson, but superior in other respects.

CUMBERLAND TRIUMPH.—Rather soft berry; seeds small, resting upon the surface. Ripens in every part at the same time. Uniformly of large size—fig. 3 is a fair average. Our vines, June 4, were loaded with berries, though exposed to the same frost as all the others. The shape is perfect, the flavor is very good. The acute lobes of the calyx, from three to five, are so constant as to aid in determining this variety. Pale red, or pink. Too soft for market.

CAPTAIN JACK.—Fails here. The vines are not strong; fruit very small, acid. Not productive. Fig. 4, is above average size.

PROUTY'S SEEDLING.—Fig. 5, is a full average size. Very strong vines; very prolific. Bright red, of fine flavor; uniform in size and shape; often growing together. It is not very firm, but is valuable for home use, or a near market.

NEW DOMINION.—Is of no value here. Fig. 6.

STERLING.—Dark color, good flavor, poor growth, small. Fig. 7.

BELLE DE LYONS.—Thrifty vines, late. Good flavor, not productive. One of our correspondents, a gentleman of great experience with strawberries, is confident that this is Boyden 30 The variety sent to us is not Boyden 30, as will be seen by reference to fig. 8.

GOLDEN DEFIANCE.—This has done admirably with us this season. The plants grow tall and strong, and bear for a long time in great abundance. Our last berries were taken from Golden Defiance. They are plump, shapely, and high flavored. The plants are very vigorous growers and form large, healthy stools. We commend it to our friends for trial, see fig. 10. The color is light red, nearly that of Cumberland Triumph.

DONALDSON'S SEEDLING.—Late. Variable in shape. Bright red, medium flavor, not very firm. Fig. 9, is the outline, between fig's. 2 and 15.

KERR'S PROLIFIC.—Fig. 11. Too much injured by frost. Late. Rather small. Of fair flavor. Not firm.

BEAUTY.—Fig. 1, represents one of the largest berries picked from this seedling of Mr. Durand. More generally the size and outline are those shown by figs. 12 and 14. For our soil and situation we prefer Beauty, to G. American. The flower stems are strong, and grow erect, only falling over from the weight of the berries. In one instance they were so evenly balanced upon the spreading pedicels, that the stem remained upright until some were ripened. The color of Beauty is bright red. It ripens with Boyden 30, and bears handling well. The plants were vigorous, and bore tolerably well. Flavor ordinary.

SHARPLESS.—Not yet tested. We are indebted to Messrs. Ellwanger & Barry, for plants received a few weeks ago. Our engraving, fig. 15, is from a drawing loaned to us by a friend.

CRESCENT SEEDLING, AND FOREST ROSE.—We may say the same of the above two varieties, except that we owe our thanks for plants, to Rev. E. P. Roe.

REMARKS.—We have a number of other new varieties, which fruited during the past summer, but they were so injured by the frost, that, as we cannot speak well of them, we do not feel justified in speaking of them at all.

Bergen Co., N. J.

Arboricultural.

EVERY-DAY NOTES.

SAMUEL PARSONS.

A VIGOROUS TREE.

Every adjective must be used in a relative sense, at least, when applied to trees. When we speak of a tree as specially vigorous, it must be simply as compared with trees growing in the neighborhood. Soil and climate so modify nature that what is great for one section, may be quite moderate for another. The Weeping Slippery Elm is most emphatically a vigorous tree, considered in this light. We know, indeed, of hardly another tree that will so readily and frequently make a growth of six feet during one season, in the soil and climate of this section. It is, moreover, a valuable, ornamental tree in yet other ways. The vigorous growth it assumes, develops great sweeping branches which arch and weep in the most fantastic manner. Seen against a clear sky, either at rest or blown about by the wind, the foliage takes on shapes, the similitudes of which afford whimsical fancy most abundant material. This extravagant tendency produces, however, in time, evil results, by developing naked branches more or less sparsely clothed with foliage at the outer ends. The remedy for such bareness is a sharp pruning, yearly, back to the first strong curve of the last year's growth. In mentioning the Weeping Slippery Elm, its peculiar fall beauty should never be forgotten. Autumn retains the foliage of few trees in any degree of beauty. Hence, when we perceive the leaves of the Weeping Slippery Elm in full freshness and vigor, weeks after the foliage of other Elms is yellow and falling, we must needs deem it a valuable quality.

The value of this trait is, of course, quite distinct from the glow of decaying leaves, but, nevertheless, too little sought after. There are trees to be specially enjoyed in spring and early summer, and trees that belong to late summer

and fall. They each have their appointed time and place for sovereign man's enjoyment.

THE CHINESE CYPRESS.

Here we have a most remarkable instance of a tree of rare and exquisite foliage attained only in late summer and fall. Like the common Southern Cypress, a near relative, it is largely unfitted for street planting, because the foliage delays full appearance until July. To increase this unsuitability, it evinces a most decided antipathy to high, dry land, thriving best in low, moist places. It is such a lovely tree, as seen in fine specimens at the present date, that its likes and dislikes should have strenuous attention, to the end that its full beauty may appear. Erect and elegant, in the strictest sense of the words, its form, hardly pyramidal, resembles more the cone of a fir-tree. The color of its light foliage for delicate tender green, can be compared to that of no other tree, and is its greatest charm. Plant it, as a rule, in spring, rather than in fall, for its light peculiar wood is not exactly calculated for the early attacks of winter.

THE TAMARISK.

Few plants, the foliage of which at this season attracts the eye, have greater charms than the Tamarisk. There are several varieties in common use, T. Africana, Indica, Gallica, etc. Indica, at present, demands attention because it is in bloom; Africana flowers in late spring or early summer, and has consequently now lost much of its beauty, although its fresh green leaves can never be otherwise than pleasing. The feathery foliage of the several varieties is surmounted with plume-like, pink flowers, more or less alike, but in the season of blooming, differing enough to present a series of bloom throughout the summer. Beautiful as the almost tropical aspect of the Tamarisk is, a fatal defect is sure to develop with age, in the shape of long, naked, ungainly branches covered only at the outer ends with foliage. This unclothed condition need not appear, however, if a sharp pruning be resorted to yearly, leaving only six inches to a foot of the wood of the growing season just past. The vigorous habit of the plant will enable it to regain the original beauty which existed before the pruning was executed. While there are few amateurs wise enough to institute this sharp discipline, there are still fewer who understand that each variety of Tamarisk must be pruned differently. For instance, the Africana is properly pruned immediately after it flowers, as the blossoming wood is developed the year before the bloom appears. If this wood, therefore, were pruned in winter or early spring, no flowers could be expected that year. On the other hand, Indica, blooming now, late in the season, must be pruned early in the spring, as the flowers come on wood formed this season; that is, the same year. Query?—Do not all late-flowering plants, as a rule, bear their blossoms on wood grown during the same year? It may be readily seen from this, that shrub pruning is not so simple as might at first appear.

Floricultural.

THE HOLLYHOCK.

WM. C. L. DREW.

Years ago, while floriculture was yet in its infancy, the tall, red Hollyhock—Althæa rosea—was to be seen in every garden; its tall spike, eight to ten feet high, showing here and there a single blossom, generally of a dull red color. How wonderful has been the change in its appearance since it became the sole property of a few energetic and true flower lovers, after it had been left to take care of itself, or die out, as the taste for finer flowers grew among the masses. For many years it was unnoticed, and almost unknown by the great majority of florists and amateurs; but within a few years, it has again resumed its place in many gardens, a changed and marvelously improved plant.

No plant exemplifies the effects of cultivation and hybridization better than the Hollyhock of the present day, than which, there is no finer or more desirable ornamental perennial, or, more properly, biennial. The improved Hollyhock has been reduced from a tall, straggling grower, ten feet or more in hight, to a handsome plant, five or six feet high.

The sparse flowers from single, scattered specimens, have been transformed into balls of beauty, completely encircling and covering the spike for from two to four feet. Instead of a few dull shades of red, we now have them varying in color, from the purest white, and most delicate pink, to the most brilliant crimson; from the clearest sulphur, to a deep golden yellow; from clear rose, to a purple so deep as to be almost black, the flowers rivaling in doubleness, the finest Rose or choicest Dahlia.

The Hollyhock is properly a biennial, but by judicious treatment, it may be made of perennial duration. The seed for the very choicest varieties, are propagated in this way. They should be sown as soon as possible in the spring; when the plants appear, thin them out until they are about one foot apart, and then allow them to remain undisturbed until the following October, at which time they should be transplanted to the place where they are desired to bloom. When the best growth and the finest attainable results are desired, the plants should be set in strong rich soil, which should be well stirred, and mixed with well decayed stable manure, in liberal quantity. When the flower stem appears—usually in June or July—it should be fastened to a neat stake, to prevent its being blown around and spoiled. If it is desired to preserve the roots for further flowering, the old stems should be cut off one foot above the ground, in August. In September or October take up the root, divide it with a sharp knife, and reset it in fresh, rich soil. In this way the plants may be continued for many years.

In planting Hollyhocks, a great deal depends on the proper situation. As the flowers are large, and the stems erect, the plants produce the best effect when grown in rows at the back of the border, or an avenue of Hollyhocks, with a back-ground on each side of some foliage shrub with bright green leaves, is one of the finest sights to be desired. A circular bed in a lawn, in which are set from three to five plants, is, if no other flower beds are near, very unique and fine; the bed may be edged with Cannas, with pure green foliage.

One great advantage to the amateur is the close approach to certainty with which the choice double strains will come from seed, for at least fifty per cent of the seedlings from good seed, will be double. All semi-double and single-flowering plants should be removed as soon as noticed, to prevent the seed of the double roots being deteriorated by their proximity.

Chater's English Prize strain of Double Hollyhocks, is the most beautiful, and while the seed costs higher than other strains, it should be obtained, where possible.

El Dorado, Cal.

HYDRANGEA PANICULATA.

Three years ago I read the Rural's description of this fine shrub, and concluded that I must plant one. When received from the nursery, it was carefully planted, staked and mulched. A hole was dug two feet deep, and three and a half feet broad, and filled with good garden soil. Once a week during the growing season, it has had a pail of liquid manure from the barn yard.

The first season it made a large growth and produced three flowers; the second season I was rewarded for my care with fifty-six flowers, most of them large, grand and showy. I have just examined our shrub, and find that by this, the third year from planting, it is about five feet high and six feet across. It having been frequently cut back, seventy-eight cuttings and sixteen layers have been taken from it. Ninety-two pyramidal panicles drooping their beautiful white heads gracefully to mother earth, are the result of this season's bloom.

I am glad the Rural so freqnently urges its readers to plant one of these desirable shrubs. I am sure they will find it a source of pleasure to themselves, a great addition to the beauty of their homes, as well as another charm in rural life. RURALIST.

Walden, N. Y., Aug. 31, 1878.

Field Crops.

PREPARING GROUND FOR WHEAT.

W. J. FOWLER.

At this season farmers in wheat-growing sections are preparing for seeding. Some suggestions on the subject may prove of value to many. It is not enough that the ground be well plowed and in good tilth. There is such a thing as too much plowing. Once well done is better than more. What after cultivation is needed should be on or near the surface. It will be all the better if at the same time the ground is compacted as much as possible. One of the best wheat crops I ever knew was on a quack-covered field plowed in June and trampled on all summer by a large flock of sheep. Every vestige of quack was kept down, the sheep gnawing every green spear down to the roots and eating even these. The field was thoroughly cleaned, but the sheep were poorer in the fall than they were when put in the field in the spring. The field of ten acres yielded four hundred bushels of bright, plump wheat. The land was only lightly cultivated, and the wheat sown broad-cast on the furrow and dragged in. I do not instance this as an example to be implicitly followed; but as giving some valuable hints. The sheep droppings enriched the surface of the field, and the tramping compacted it so that the roots had a firm soil to hold against the winter. The luxuriant fall growth of top further protected the roots from the severest cold.

The chief difficulty with wheat on stubble ground, is in getting the soil compact enough. This year my barley was so badly "crinkled" that I cut it lower than ever before. The ground was rolled smooth, and free from stones so there was no trouble in cutting almost down to the ground. This stubble is now turning under so nicely that I shall never again leave long straw to be plowed in. It is of no value as manure, and it does make the soil dry out a great deal quicker than it should. This not only checks the growth of the wheat, but predisposes to attacks of the Hessian fly. On the other hand, a short stubble turned under, leaves the soil nearly as compact as if it were a fallow.

The seed-bed should be as rich as it can well be made. The ground need not be rich very deep for wheat, nor should it be manured with coarse manure. Either use some concentrated fertilizer, or leave the field for some spring grain, oats or barley. It is better to save the wheat-seed than to sow on soil too poor to bring a crop and finally have to plow it up at the last, as many have learned to their sorrow. Wheat is the king of grains and is correspondingly fastidious in its choice of food. A grain of concentrated fertilizer, like guano or superphosphate, will do a wheat-plant more good than a forkful of coarse manure buried in contact with its roots. Use the coarser and cruder manure for the corn ground and save the finer portions for wheat.

If every thing is right, the wheat should be well up in the drill-marks in five to seven days after sowing. I have known wheat sown just before a warm rain to come up in four days. At this time I like to have a sharp frost to check the fly and insure a healthy, fall growth. Wheat is no exception to the rule that plants are most prolific near the northern boundary of their growth. It needs frosts and cold to check its growth and make it tiller at the root. Hurtful as severe frosts sometimes are, we should yet regret them, so far as wheat was concerned, if they entirely ceased.

I find that many farmers are afraid of having their wheat-fields too compact, and so cultivate them up just when they are in right condition for seeding. If weeds abound this may be necessary; but weeds should not be allowed in a fallow intended for a seed-bed. The roller and drag are the only implements needed, and if used alternately once every three or four days, the soil will be kept clean and compacted at the same time. I do not think much of any green manure for wheat. Even clover is quite as good in most soils if plowed under after the first crop has been cut. The clover top makes the soil too light, enriching the ground for future crops, but insuring, with ordinary seasons, a failure of the wheat crop for the coming year.

Monroe Co., N. Y.

Horticultural.

THE FRUIT FAMILY.

PROFESSOR W. J. BEAL.

In all ages of the world we read that certain families of men have stood out boldly because of their great deeds.

Certain orders have contributed nearly all of our domestic animals. The Pachydermata give us the elephant, the hog, the horse, the ass; the Ruminantia give the reindeer, goat, sheep, ox, zebra, buffalo, camel, dromedary and llama. The Rasores, among birds, give us most of our valuable domestic birds, as doves, pigeons, pheasants, turkeys, peacocks, guinea-fowls, grouse, quail and fowls.

Among plants, certain families stand out in bold prominence for the useful products which they give to the support of the human race. To the Gramineæ, or grasses, belong all our cereals, wheat, rice, oats, barley, rye, maize, etc; also all of our true grasses found in meadows, pastures, lawns, and wild prairies. They are of immense value to the people and their domestic animals.

Several other families of plants contribute freely to our numerous wants. There is one which stands foremost in importance to the horticulturist, especially in the department of pomology. I refer to the Rosaceæ, usually known in popular language as the Rose-family; but it seems more suitable at the present time to speak of it as the Fruit-family. The Pomes belong to this family, and include apples, pears, quinces, medlars, and service-berries. The Drupes belong here also, and include peaches, almonds, apricots, nectarines, plums, and cherries. There are several others of great importance, including the strawberries, raspberries and blackberries.

In the north temperate zone, we have but few fruits left after taking out those belonging to the Rosaceæ. The best of those left are grapes. There are also currants, gooseberries, cranberries, and huckleberries.

Of the great value of fruits, I need say nothing. Some of them have probably arrived as near perfection as they ever will; others may be much improved, while some of them have scarcely begun to show their capabilities. We have no idea what may be done with a plant until it has had a fair trial in skillful hands for a long time in a great variety of soils and climates.

Very likely some insignificant shrubs, and vile weeds stand ready to change to useful plants with a little intelligent effort in the right direction. Right here I am again reminded of Emerson's definition of a weed, viz.: "A plant whose virtues have not yet been discovered." Last year I received some forty or more kinds of vegetable seeds from Japan. Among them were several called radishes. One of them, from the first, had a familiar look which I thought I recognized. The roots of this particular one were very long, white, tender, and of good size. They were rather strong, but no stronger than some genuine radishes which came from the same source. This year the plant in question has produced flowers and has turned out just what I expected—our common burdock improved.

The fruit family is a small one when compared with many others. It only contains somewhat over a thousand species which are mostly natives of the north temperate zone. Among plants for the florist, there are some choice species. Among these are the Spiræas, Potentillas, Hawthorns, Japan Quince, and the numerous kinds of Roses. The last genus, the Rose, has been styled the queen of flowering plants and, from the remotest ages, has stood without a rival for its delicate colors, perfection of form, and delightful perfume.

Agricultural College, Lansing, Mich.

Miscellaneous

THE TRUTH ABOUT IT.

[Under this heading, a number of articles have been prepared by able writers. These will appear from time to time. Their object is not at all to deal with "humbugs"—but with the many unconscious errors that creep into the methods of daily country routine life.—Eds.]

FALLACIES ABOUT SHEEP.

There is a general impression, amongst those who do not know, that by means of sheep a great deal may be made out of nothing. We may frequently see absurd statements to the effect, that "the sheep's foot turns all to gold;" that there is no readier or surer way to fertilize a barren field, than to put a flock of sheep to pasture upon the briers and weeds in it: that, in effect, sheep will live upon the poorest food and make the richest manure, and are thus the very best stock a farmer can keep on his farm. But those "who have been there" know better. "Sheep are always an unhappy flock,"—*oves semper infelix pecus*—wrote the old author, Virgil, and many a man who has been deluded into keeping sheep in the vain hope of finding gold in their foot-tracks, has found out "the truth about it."

Now, having been through the mill and having turned defeat into victory by disabusing my mind of the common fallacies about sheep, I warn intending shepherds that there is no other domestic animal that needs better care or food, for profitable thrift, than sheep; that out of their finely-grinding manure mill, comes nothing that is not first put into the hopper; that yet with proper care and skill, a well selected flock of the the right kind of sheep, in the right place, can be made to pay 100 per cent on their cost every year. It is true that a flock will clear a field of weeds, briers and rubbish and will enrich it; but it will not live upon these alone. To relish this rough herbage, the sheep must be fed liberally upon supplementary food, such as bran, meal, cut clover, grass, or green-corn fodder and always a pint a day per head of linseed oil-cake meal, bran or other grain food. Then, with this alloy, the sheep's foot will take on a golden tinge, and will edge with gold the farmer's pocket, by making his poor lands rich; giving him at the same time a lamb or two, and a fleece every year. A field may be enriched, too, by sowing rape seed, this month, at the rate of a peck per acre, and when the crop is of thrifty growth, the sheep may be turned in to eat it down through the late fall and early spring; thus fitting it for a crop of corn, oats, or roots, next year. But the sheep must have their pint per day of bran or oil meal even then.

The fact is, sheep are manure spreaders, rather than manure makers. We feed them with the material; they take their pay out of it, and give us back the remainder, transformed into a substance of equal value—because it is more available—with that which they received, and they get fat meanwhile in doing it. Just as we give the mint a bag of gold dust and we get back exactly the same weight of gold dollars, while the coiners have fed upon it—but without the dust we get no dollars. So with sheep: if we don't feed them with the materials needed to make fat for themselves and rich manure for us, they will be as unprofitable as Pharaoh's lean kine. And this is "the truth about it," as proved by A Shepherd.

WHAT OTHERS SAY.

Prickly Comfrey, Half a Century Ago.—According to the Sydney Town and Country Journal, Mr. D. Grant wrote a letter to Lord Farnborough in 1830, telling that some years back, he happened to have two of the above plants growing near an open fence where his cattle passed daily. As soon as it sprung up so

that they could reach it, they fed on it with the greatest avidity. The following year they did the same. He then thought, if it should prove wholesome, it might be turned to good account as green food for cattle generally, and in consequence, he set about increasing it. He fed horses, cows, sheep, pigs, and geese with it, and they did well. As it was of such wonderful growth, and could be cut successively from April to October, it might, he thought, be cultivated to great advantage.

Mr. Grant then says, "My neighbor, Moorey, the veterinary surgeon, had a young mare last autumn very bad with the strangles, so much so that she had left off feeding. He thought of the Comfrey, and sent for me. She immediately began to feed on it, and she soon got well." He considers that, on account of its *oily nature*, it was of the greatest service.

He found that cows did not take it in the first instance so freely as the horse, but they all soon took to it, and then they were quite as eager for it. In 1827 he fed the worst cow he had, entirely upon it for some length of time; she did well, and milked better than she had done before. The cream was thicker and well flavored.

For sheep and lambs he found it very good; they took it freely, lambs would feed on it before they were a month old. For pigs it was very useful, they eat it freely and did well. He kept a sow chiefly on it, with twelve pigs; she brought them up well; they all fed on it before they were three weeks old. Geese did well on it, the young ones would feed on it as soon as hatched. He had no hesitation in pronouncing it a most valuable discovery, as it would grow in all soils and situations, better than any other plant; it might be planted by the sides of ditches in any waste corner of fields, orchards, gardens, etc., where useless rubbish grows; it was a plant that no one could lose by, as the only expense was the purchase of a few in the first instance, etc., etc.

Perhaps some of our readers from a perusal of the gist of Mr. Grant's letter, may be induced to make another effort to coax their live stock to eat Prickly Comfrey. If they could only coax them to "take" it *once*, their animals might forever after feed upon it with "the greatest avidity." The first dose has proven with us the rub!

DISAPPOINTED SCHOOL-HUNTER.—A school-hunter sums up, in the Nation, the result of his inquiries for a school from which his girls would be turned out simply with good health, a taste for knowledge, and a proper sense of their own ignorance (!) He finds that he cannot get such a school, "partly because it would cost more than most parents could afford to pay, and partly because most parents would not patronize it, if it were within their reach."

CATALOGUES, &c., RECEIVED.

ELLWANGER & BARRY, Descriptive Catalogue (No. 1) of Fruits. In this as compared with previous circulars, the principal additions are in Peaches, Grapes, Plums, Strawberries and Raspberries. Among foreign pears, special prominence is given to Petite Marguerite, Bonne du Puits Ansault, Andre Desportes and others. Among American varieties, one never before presented in any catalogue, viz., Frederick Clapp, is offered. Messrs. E. & B. have known this variety for five years past, and deem it worthy the high rank awarded it by the Massachusetts Horticultural Society. Among Peaches, Waterloo, a new, "large and beautiful variety," ripens in Western New York in *the middle of July*. Engravings of this peach, of a number of new Pears and a colored plate of the Sharpless Strawberry, will be found in this catalogue.

The third volume of the North American Ayrshire Register, containing a continuation of the list of animals of this excellent breed, whose descent is traced back to an imported ancestor. The work, of 174 pages, by its excellent arrangement, fine, clear typography, and handsome binding, reflects great credit on its editors and publishers, E. Lewis, and Jos. N. Sturtevant, South Framingham, Mass.

MR. JAMES H. RICKETTS sends us a bunch of a seedling black grape which he calls "The Welcome." Its parentage is Pope's Hamburgh crossed with Canon Hall Muscat. The bunch is compact and the berries of a richer flavor than that of either parent.

B. K. BLISS & SONS, 34 Barclay street, N. Y. Catalogue of small fruits. Potted strawberry plants for fall planting—the newer varieties—Raspberries, etc. Fruit and ornamental trees, winter plants, etc. This is free to applicants.

The Windham Co., (Vt.) fair, will be held at Newfane, Sept. 18, and 19; Bidport and Crown Point fair, at Crown Point, Sept. 4, and 5; Brandon Town Fair, October 1, and 2, including dedication of Sprague Agricultural Home.

BENSON, MAULE & Co., Philadelphia, Pa., Combined Catalogue of Thoroughbred Stock, fall seeds, bulbs, plants, etc. Illustrated. This is mailed free to all applicants, and is well worth sending for to those interested.

ELEVENTH ANNUAL REPORT of the Ohio State Hort. Society, M. B. Bateham, Secretary, Painesville, O. An instructive work of 95 pages.

E. B. RICHARDSON, New York, circular of Fruit and Ornamental Trees for the fall of 1878.

SAMUEL KINSEY, Dayton, O., Wholesale Price-list of small fruits.

Veterinary

VERTIGO OR MEGRIMS.

ANSWER BY D. E. SALMON, D. V. M.

William Hodges, Chickasaw Co., Miss., says: "I have a mule that seems to be affected with what my neighbors call 'fits.' There are no regular times for her spells; they are liable to come on at any time, but are more frequent in cold or damp weather. When she has one, she trembles all over, whirls around, and if possible, strikes her head against something. This last-named feat seems to be her object in turning around, for when it is done she soon becomes quiet. These spells only last a few minutes, then she is well and able to work. Please tell me what the disease is and the remedy, if any, for it."

ANS.—The disease is known as vertigo or megrims, and in many cases it is impossible to decide as to its real cause. It has been, under different circumstances, attributed to over-feeding, to disease of the heart and lungs, to pressure of the collar on the veins of the neck, and to different diseases of the brain; by others certain forms of vertigo have been considered as purely nervous affections without any organic changes whatever. It is obvious that it would require a very careful examination by an experienced person to decide as to the curative treatment that should be adopted in any particular case. Very often, too, this will fail in the most skilled hands. The only advice that we can give is to see that the harness does not interfere with the circulation of blood through the neck; if the animal is in high condition, reduce the feed; give a purgative (aloes 4 to 6 drachms, or Glauber salts one pound), and follow with diuretics or sedatives (nitrate of potassa or bromide of potassa in two to four-drachm doses twice a day;) when the attack comes on, it is best to loosen the collar, cover the eyes with a thick cloth, apply cold water or ice to the head, and, in obstinate cases, to bleed. A long run to grass, in some cases, causes marked improvement.

Industrial Implements.

FAIR NOTES.

THE SYRACUSE CHILLED PLOW COMPANY, SYRACUSE, N. Y.—The Syracuse Chilled Plow Company do not send their usual advertisement for this number of our paper, for the reason that they have outgrown their capacity to supply orders. They say that their experience shows our paper to be a most excellent advertising medium, and that if they give us an advertisement it would only add to their difficulties. But as they are erecting new works, which will be completed November first, which will give them the capacity for making forty thousand plows a year, they will then lay before our readers something worth reading in regard to their celebrated CHILLED PLOWS.

THE CIDER-PRESS SCREWS made by Rumsey & Co., have been very generally used for years. They may be seen on the fair grounds at Elmira, or a reference to the firm's announcement in this number will supply all needed information.

THE NOVELTY POCKET SCALE is a compact little scale, cylindrical in shape, and less than three inches in length. It will weigh matter from an ounce to fifteen pounds, the entire scale being graduated in fractions of pounds. Aside from its compactness and accuracy, the novelty consists in a sliding shell that may be moved up or down the weigh-beam, so as to give the exact weight of any article without a second operation to ascertain the weight of the receptacle in which it was weighed. A scale has been left at this office for examination. It will do what is claimed for it.

THE BILLINGS HORSE SHOE, which may probably be seen on the grounds at Elmira, is quite a new departure in the construction of horse shoes. A reference to the advertisement will show the shape and appearance of shoe when in use. It is claimed that the wide foundation offers a perfect support to the hoof, while the rim of the shoe offers a solid resistance to the road, preventing side-slipping, and giving the horse a confident motion, while it increases his locomotive powers by affording a secure foothold. We have seen commendatory letters from many capable of judging, who speak without reserve in its favor. It is said that it effectually cures "interfering." We are testing a set on the Rural Experimental farm, but the shoes have not been in use long enough to give decided results.

THE COATES RAKE, of which over 50,000 are now in use, will be efficiently represented at the New York and Pennsylvania State fairs, by the eastern agents, Messrs. Nash & Bro., of New York. Its special claims to the farmer's attention are enumerated in the advertisement.

FLORIDA HOMES FOR ALL have been proposed by the Florida Land Co., as may be seen by a reference to their prospectus in another column. These lands are situated on the line of the Transit Railroad, and are offered at $1.25 per acre. The agents, B. T. Smith & Co., are well-known business men in New York.

MONTGOMERY'S Improved Rockaway Fan-Mill, exclusively controlled by Dorsey, Moore & Co., Baltimore, Md., is a thoroughly-made, powerful fan. It has secured 210 premiums and 15 medals. It will do all kinds of work, and performs its task satisfactorily. We have carefully examined the implement and think it capable of cleaning sixty bushels of wheat per hour, as is claimed by its makers. The above firm will supply any further particulars needed.

THE CORN-SHELLERS and Grist Mills made by Livingston & Co., Pittsburgh, are well-known. Over twenty thousand are now in use. The corn-sheller now used on the RURAL Farm was supplied by this firm, and it has done its work satisfactorily without costing anything for repairs.

THE I X L FEED MILL made by the U. S. Wind Engine and Pump Co., Batavia, Ills., will be a prominent visitor to most of the State fairs. It is a superior mill. The grinding-plates are of white chilled metal, and reversible. The illustration, as shown in the advertisement, gives a good idea of the appearance of the mill.

LA DOW'S NEW WHEEL CORN CULTIVATOR will be on exhibition at the New York State fair. This cultivator has a series of discs (three or four) attached to a wrought-iron frame. The discs are arranged so as to be perfectly adjustable, and can be placed so as to throw the earth either to or away from the hill. The driver's seat is attached to the end of the pole. This implement should be seen by all of our readers visiting the fair.

HORACE WATERS & SONS, New York city, offer their mirror-top 12-stop organ, for only $85, which is selling it for a song. During the thirty years this firm has been in business, their aim has been to make the best goods possible for the least money, and they consider this last offer as another striking proof of their devotion to the interests of the music-loving public. All instruments are warranted for six years. Their illustrated catalogues will give those who think of taking an agency, a good idea of the attractive styles, low prices, and inducements to handle their wares.

BRADLEY'S AMERICAN HARVESTER, No. 2, will be displayed at the New York State fair. This implement is distinguished for satisfactory cut, superior reeling and delivery, easy tilt, adjustable track, controllable rake and balance. Its great features are its light weight and light draft, combined with its durability.

THE JOHNSTON HARVESTER CO., comes to the fairs this year with its Paris honors thick upon it. In addition to the usual display of its fine standard machines, it will show two new self-binders and a new, light mower, that was tested this season for the first time. Its weight will not exceed five hundred and forty pounds, and the draft is correspondingly easy.

THE DISPLAY OF MR. A. B. COHU, one of the leading New York dealers in farm tools will be one of the best on the fair grounds at Elmira. The exhibit will be specially strong in corn-shellers and feed-cutters.

THE ONEIDA IRON WORKS will have some fine specimens of farm engines at the New York State fair. The work turned out by this company is characterized by its strength, durability and fitness for the uses to which it is to be applied.

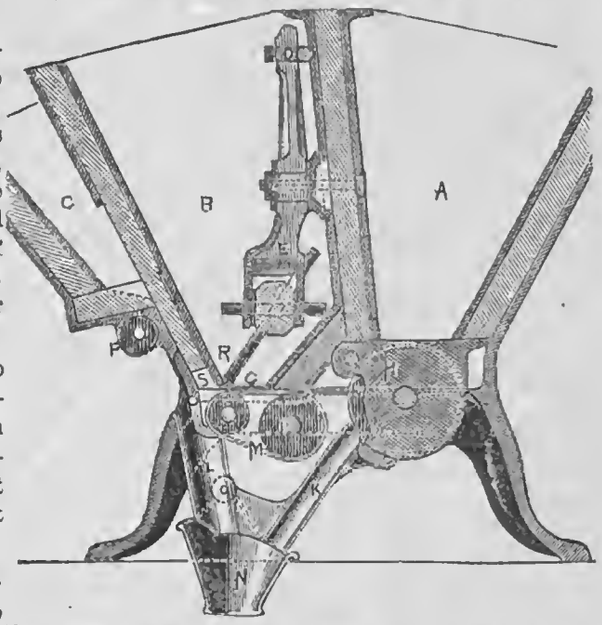
F. D. MOULTON & Co., New York city, have sole control of the sale of the Ashton Salt in this country. The salt itself is too widely known to need comment.

A NEW FERTILIZER ATTACHMENT
ADDED TO THE BUCKEYE DRILL.

IN the RURAL of June 29, the novel force-feed of the Buckeye grain drill was illustrated and explained, but as has been the practice of the energetic manufacturers, anything likely to increase the efficiency of the drill has been given a thorough trial, and improvements have been added until the latest seems to be about all that was wanting to perfect the implement. The drill now has three compartments, as may be seen by the accompanying diagram.

A, represents the wheat or grain hopper; B, the hopper for fertilizer; C, the grass-seed hopper; D, Pitman connection; E, the agitator arm; F, the agitator with pin moving over the belts; G, galvanized bottom with openings over the belt; H, wheat or grain feeder and cup; K, spout or conductor from wheat hopper; L, spout or conductor from fertilizer hopper; M, leather belt for feeding fertilizer; N, spout to which rubber tubes are attached; P, grass seed feeder; R, slide for regulating the quantity of fertilizers; S, is the point where the fertilizer is discharged from the belts.

The fertilizer and grain hoppers are combined in a double hopper, and while the front one is feeding out the grain the rear or fertilizer apartment is feeding out the fertilizer—both grain and fertilizer passing down through the hoes and being deposited together in the ground.



The fertilizer is brought in plain view of the operator before entering the hoes so that he can see just what is being done. The greatest difficulty hitherto found in constructing such a machine has been that it seemed impossible to prevent the fertilizer from being worked into a sticky paste and then packing. This method for feeding fertilizer is entirely novel. It consists of a series of endless belts carried by two shafts on which are a series of small pulleys—the whole being placed under the bottom of the hopper. The fertilizer coming in contact with these belts is carried back and dropped into the tubes, the quantity being regulated by a parallel slide so as to sow a large or small quantity as desired. There is also an agitator moving very slowly in the hopper which prevents any possibility of arching. This method of feeding has been used for five years successfully in Maryland, and known there as the "Thomas Guano Attachment."

The grass seeder to the rear of the fertilizer apartment, is a miniature copy of the large grain-feed, and does the work as carefully and accurately. The device for working the hoes in line or zigzag is easily worked by a boy, and in fact the entire mechanism is so nearly automatic and works so smoothly that the drill, during the twenty years it has been manufactured, has retained and added to its popularity constantly. Messrs. P. P. MAST & Co, Springfield, Ohio, are the manufacturers.

THE IRON TURBINE WIND-MILL.

THE Iron Turbine Wind-mill has, since its introduction two years ago, by MAST, FOOS & Co., been slightly modified by the addition of a mechanical device that increases its power. As at present offered to farmers, the mill is unique in construction, has but few parts and is solidly built. The working parts of the mill are entirely of iron. The power instead, of being accumulated as in the ordinary mills by means of slats and arms, is gathered by an iron wheel, modeled on the turbine principle, with a motion so unusual in this species of motor as to at once attract attention. But few parts enter into the construction, and these are well put together. The wheel is made of heavy sheet-iron, and the few joints are easily oiled. The turn-table works easily and freely. It has a tail-vane which holds the wheel facing the wind, except when operated upon by the governor, which works automatically.

The regulating vane stands upright over the wheel and is held in position by an adjustable weight upon the lever, and can be regulated according to the power required. A very strong wind turns the vane downward, and a gale throws the wheel entirely out of gear, until the danger is passed, when work is resumed.

This mill will be in working order at the fair grounds at Elmira, N. Y. where its peculiar excellencies may be seen.

THE CHADBORN & COLDWELL MFG. CO., of Newburgh, has just constructed a hand lawn-mower, which is very simple and easily run. It does not exceed fourteen pounds in weight, and will cut a ten-inch swath. The idea was suggested to Mr. Coldwell while in France. He there saw a French machine intended for use by ladies and children. He has improved on the foreign implement, and the company now have a mower that can be sold at a very low figure, and that can be handled by a mere child.

C. AULTMAN & Co., Canton, Ohio, have just filled an order for six Buckeye mowers and reapers to be shipped to Durban, Natal, South Africa. One of their Canton monitor engines has also been sold for shipment to Ireland.

AULTMANN, MILLER & Co. have put out five hundred of their wire binders this season, and could have added largely to this number had they had the machines for sale.

The Querist.

ANSWERS TO CORRESPONDENTS.

Cheap Roofing.

Robert C. Brown, Chautauqua Co., N. Y. asks whether there is not some roofing that is better than, and just as cheap as shingles, for barns, &c.

ANS.—With shingles at $3.50 per thousand, 100 sq. feet would cost $3.50, to which add for labor and nails according to rapidity of hands and amount of wages. This is the best roof known. Its quality and durability, however, depend almost entirely on the perfection of the work. No poor shingler can make a good roof even with the best material. In some parts of the country where a good carpenter is a rarity, roofs are often made of floor boards. Flooring at $30 per thousand, allowing one-sixth for waste, tongues and grooves, will cost the same as shingles at $3 50. And on this basis, the relative price of the articles in different sections, will determine their comparative cost. Prepare the rafters and shingling lath as for shingles, but use only one-third as many laths; let the boards be dry, to run up and down the roof. White lead should be in the joints, and the boards should be laid by means of floor pins, like a floor. The joints should be tight, and one coat of any cheap paint should be applied to bind the wood, and few men will live to see it worn out. A coat of paint should be laid on once in three years. The boards should not be spliced, but they should be bought of a length to suit the length of pitch. This roof sheds water like a duck's back.

Angora Goats.

J. Layne, Grayson Co., Texas, asks for some information with regard to the Angora goat; what has been the result of its importation into this country; can it be made profitable here; how would the climate of Texas suit it; where can pure-blood animals be bought; and where and at what price can their product be sold.

ANS.—The Angora goat is a native of the vilayet and town of Angora, in Asiatic Turkey, 220 miles east-south-east of Constantinople. It is situated on an elevated plain abounding in pasture and is famous for the breed of goats, whose soft, silky, white hair, about eight inches long, forms the chief article of export. In 1869 the number of these goats in and near the town of Angora was estimated at 1,000,000. They are shorn twice a year and the annual yield of wool is about 2,700,000 pounds. The fineness of the hair is by many ascribed to some peculiarity in the local atmosphere, for even the cats, dogs, and other animals of the country are, to a certain extent, affected in the same manner as the goats, and they all lose some of their distinctive beauty when taken to foreign countries. The first importation of these animals was made into this country in 1849, in South Carolina, and again in 1863 further importations were made. Since then, experiments have been made with them in several States, notably in Ohio, California, Tennessee and Maryland, but within the last five or six years little is known to the public of the results. About eight years ago a Mr. Euty cides imported about 240 of them into Maryland, where he held them for sale at $100 each, a price at which they sold very slowly. Afterwards he took a farm in Virginia where he was unfortunate with them, losing a number of them through their having eaten poison ivy. Should any of our readers be able to answer more fully our correspondent's inquiries, we shall be happy to publish the information in the RURAL.

Water-Lilies Wanted.

Mr. Robert Brewster, Houston, Texas.—Having a fondness for Water-lilies and having read in the RURAL a description of those grown by Mr. William Falconer, inquires where he could purchase the yellow and white varieties. They grow wild about thirty miles from Houston, but he considers it would be easier and cheaper to buy them than to search for them in their native retreats.

ANS.—We have seen them advertised, but cannot at this time recall the advertisers. We print the above so that parties having them for sale may answer the above question.

Miscellaneous.

J. F. S., Lewis Centre Ohio, asks, (1.) How to propagate Clematis Sophia; can he do it by layering; is it hardy in his latitude; had he better take it down and cover it on the approach of winter; is it considered a good variety. (2.) He also desires to learn why he fails to make cuttings of the single Petunia grow, for, although he is anxious to propagate from some very finely marked ones in his possession he cannot succeed for some reason.

ANS.—Clematis Sophia is perfectly hardy with us. If taken down carefully and covered lightly, no harm will follow. But our method is to cut back the Clematis severely every fall to within a few feet of the ground. Then they may be covered, if so desired, with very little trouble, and they bloom the more profusely for it. It is a splendid variety. You can propagate it from layers.

(2.) We cannot say, inasmuch as you do not state your method. If cuttings at this season be placed in sand and kept moderately moist, there will be no difficulty. A common box or large flower-pot, well drained and filled with four or five inches of sand, is all that is needed. It may be exposed to the sun, in which case more water will be required. It is best to cover at night or to remove the propagating box to a warm atmosphere.

B., Linn Co., Minn., asks: 1st. Are seeds of Gladioli and Dahlias formed in the flower or in the ground? 2d. Is it well for the bulbs to cut the flowers as fast as they grow old? 3d. I wish to remove my Crocuses—when shall I do it? 4th. Are *fresh* seeds of Salpiglossis slow to germinate?

ANS.—1. The fruit of all flowering plants is formed from the flowers. The ovules of the ovary form the seed. Hence there is no seed where there is no flower, except in the lower orders of plants which do not bear flowers. These latter produce spores in place of seeds. The corm (or bulb) of a Gladiolus and the tuberous "roots" of Dahlias are merely underground enlargements of the stem. Some fruits form under ground, as the peanut, for example. The flower unfolds above ground, then the stile elongates, makes its way into the ground, where the ovaries enlarge, forming the fruit and seeds. But they are no more *roots* than an apple is a root. 2. It *is* well to cut off the flowers as soon as they begin to lose their beauty, because the formation of the fruit which follows, exhausts the vigor of the plant. 3. Remove them now. 4. Not that we remember.

G. H. Babcock, Jefferson Co., N. Y. asks whether a Honey-Locust hedge set out this spring, the plants of which were then one year old, should be clipped at all this season, and if so, about how much.

ANS.—We should wait until next spring to cut back.

S. L. N., Pa., inquires where he can get the seeds of Trumpet-creeper—Tecoma radicans—lately spoken of in the RURAL.

ANS.—Wm. H. Carson, Thorburn & Co., B. K. Bliss & Sons, R. H. Allen & Co., all of this city. Landreth & Sons, Philadelphia.

V. Mexico, N. Y., asks 1, how to rid a barn of hen lice; 2, how to get them off a horse or cow.

ANS.—1, We know of no better way than a thorough clearing out and cleaning. Whitewash every part, or paint with dilute carbolic acid or kerosene. 2. Washing with carbolic acid soap.

F. M. Beers, Lima Co., Mo., inquires about the scope of Secretary Schurz's late decision with regard to the "entry" of railroad lands.

ANS.—See "News" department.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, AUGUST 31ST:

SOUTH-EASTERN MISSOURI NOTES.

ALTHOUGH, "as the crow flies," only some fifty miles from St. Louis, the "Future great city of the Mississippi valley," this region is rarely heard from through the public press. The great tides of immigration moving westward sweep into Minnesota, Dakota and Nebraska, north of us, while the abnormal flow from North to South, in the case of Texas, rushes over our own Iron Mountain Railroad, and while picking up and transporting to that promised land, occasionally, one of our citizens, rarely leaves "a new-comer." And yet, as compared with many much-sought and lauded regions, this section does not deserve such utter neglect.

It is a splendidly timbered and watered country, with pineries convenient, and soil and climate peculiarly adapted to the growth of winter wheat, helping, to a small degree, to give to St. Louis the raw material for the manufacture of that high grade of flour, that in days prior to the "New Process," gave her a world-wide reputation only equalled by that of the Richmond, Va. mills. And yet, comparatively little wheat has been grown here till within a few years past. Corn has been the staple crop, on drought ridges as well as river bottoms. But a change has taken place, and it is at once an indication and an act of progress. Last year at least 33⅓ per cent. larger acreage of wheat was sown than ever before in south-eastern Missouri.

The wheat harvest commenced this year from 1st to 10th June, at least ten days earlier than usual, and the weather was cool and pleasant. We had the heated term later on. The yield was not as good as hoped, scarcely exceeding ten bushels per acre; but the quality was generally excellent and the grain was saved in good order. It is now mostly thrashed, and marketed at the low price of 60 to 70 cents per bushel from first hands, which has hardly paid expenses when raised by hired labor. Lands are cheap here, ranging all the way from government price to 25 dollars per acre for unimproved, and from 10 to 50 dollars for improved lands, which means here, lands cleared and fenced.

Building material of all kinds, rock, clay for brick, sand, gravel, etc., can be had for the taking, as also fuel; and in the mining regions houses, *i.e.* cabins, free of rent. Anyone who will examine Horace Greeley's barn, or Prof. Fowler's octagon house, in Westchester Co., N. Y., and learn to build of rock and concreate, need not be without a cheap and substantial house in this region, where all the materials are at hand, free of cost, and only the man's own labor is needed to put them together.

[Name lost.]

RURAL SPECIAL REPORTS.

WATSONVILLE, Santa Cruz Co, Cal., Aug. 18.

THE crops hereabouts are in a somewhat mixed condition. The wheat crop in this section will not be much over half a crop, if indeed it will amount to that, owing to the rust, as the very wet winter and continued fogs have been severe during the past year. Barley will be about on an average with other seasons. There was not a large acreage of oats sown, and the yield of that sown will be light. No rye was sown in this neighborhood. Corn never looked better at this season of the year, though it is rather early yet to judge of the yield, as it will be fully two months before it will be ripe, and the cut-worms are very numerous this year on the early sweet-corn, and will be likely to injure the late corn to some extent. Potatoes are, so far as I can learn, light. The fruit crop also is light; apples half a crop; pears heavy; plums and cherries a full crop; peaches, but few raised here, as they do not succeed well in this section; but what we have are very good this season. Grapes are not raised at all here. Beans look well so far, except one or two varieties. Vegetables of all kinds are very abundant. Hay is the heaviest crop ever raised here, and I understand it is so all over the State. This account applies only to this section of the State, but the papers assert that the wheat crop of California will be heavier this year than ever before, and of a better quality generally. Money is very scarce here and times are very hard—harder than last season. A. C.

[We cannot tell how long ago the following communication was received. It was found among a mass of old unpublished communications, and may prove of interest to the present advocates of tea culture.—EDS.]

MCINTOSH P. O., Liberty Co., Georgia.

In your RURAL NEW YORKER of July 26th, (no year) you desire a sample of Southern grown tea sent you. I take pleasure in sending you some, which I prepared in April, from plants growing on my *father's farm in this county. The tea was not prepared with any special care, as it was intended only for family use; I would be glad to hear your opinion of it, in the columns of your interesting paper.

The tea plant grows luxuriantly here, and bears seeds every year, in great abundance. Thousands of plants are growing in this county, of various sizes, from ten to twelve feet high, down to plants that have just sprung from the seeds, this last spring. If some enterprising northern gentlemen would only interest themselves in tea culture, in a few years our country would be supplied with southern-grown tea.

MRS. R. I. S.

DAYTON, Montgomery Co., Ohio, Aug. 21.

Harvest is over, and most of it thrashed. Farmers generally are feeling good over their large yield of wheat, although one can find some men who complain, but I suppose it takes that kind to help make up this world. Oats have turned out a little above an average crop. Meadows did their part well towards making up the harvest. Corn is looking well. We never had better prospects as regards this crop. Unless we have early frosts we shall have the largest yield we have had for some years. Tobacco, although not so much planted as usual, is looking well. Apple and other fruit trees are loaded. Wheat is selling at 95 cents; oats, 23 to 25; corn, 45 to 50 cents; potatoes, 60 cents; apples, 30 cents; butter, 25 cents. Considering all, farmers will make more, for the prices of groceries are down. C. H.

FORT HOWARD, Brown Co., Wis., Aug. 20.

Our harvest is over, and we can report, wheat at half a crop; oats, two-thirds of a crop; barley, half a crop—and poor grain—rye, two-thirds of a crop; hay, a very large yield. I have private information from points in our own State, and from Dakota, Minnesota, Iowa, and Kansas, and from all points comes the complaint of "wheat is a failure."

This is not much of a corn county, and will not make much difference with the crop of the U. S.; but, while our corn has a fine growth of stalks, and looks well, it doesn't seem to ear out well at all. Prospect in the fruit line is good. VAN.

* Mr. Wm. Jones former editor and proprietor of the Southern Cultivator, Athens, Ga.

TOPEKA, Kansas, Aug. 22.

The corn crop in this State will be above the average of previous years. Statistics just published, show that we have under this crop an area of 2,563,112 acres, which will probably yield 42 bushels per acre. There are in this State under winter wheat, 857,125 acres; spring wheat, 206,868; oats, 310,226; rye, 119,972; millet, and Hungarian grass, 164,539; Timothy and meadow, 25,214; prairie meadow, 503,612; prairie pasture, 553,717 acres. A. C.

DAKOTA CITY, Dakota Co., Neb. Aug. 17.

The corn crop hereabouts was never better; this is an excellent county for corn. There was a good crop of wheat raised, but, just before harvesting, it was so damaged by rain and wind that not much over half of it was saved. The little thrashed averages about fifteen bushels to the acre. Apples few; currants, plums and grapes, destroyed by the cold snap in May. C. C. B.

BYHALIA, Marshall Co., Miss., Aug. 24.

The corn crop is very fine, and the acreage larger than any year since '62, when the whole county was planted in corn. The yield will average 25 bushels per acre. Wheat, a failure. Peach crop heavy, but fruit generally defective; few apples. Cotton promises better than any year since '55. In some localities I hear of worms, but do not credit it. H. C. S.

EL DORADO, El Dorado Co., Cal., Aug. 19.

IN El Dorado Co. there is no corn raised except sweet-corn for table use. Very little wheat, barley or oats is raised here, except for fodder. There is a considerable acreage of hay here, and this season the crop was extra fine. Fruit crop unusually good. D.

Dairy Husbandry.

SCALDING MILK FOR BUTTER.

T. H. HOSKINS, M. D.

As great as is the improvement in cream-raising, by the use of deep vessels set in ice-water, for large dairies, quite as great, in my judgment, is that of scalding the fresh milk before setting it in small pans, for dairies where only a moderate number of cows is kept.

METHOD OF SCALDING MILK.

Though it has long been known that scalding milk hastens the rising of the cream, while prolonging the period of sweetness in warm weather, it is only lately that this method has been reduced to a system, and to a considerable extent popularized, through the efforts of Mr. Ellsworth, of Massachusetts. By experiment he has ascertained the precise temperature—135 degrees—for securing the best and most uniform results. I have, myself, tested his practice, and find it excellent. The milk is strained into a brass or copper kettle, large enough to hold a single milking, and the temperature slowly and carefully raised to the proper degree. It is maintained there for about half an hour, and then poured into pans and set upon the racks of the milk-room which should always be well aired, so as to remove the vapor arising from the milk, and prevent its being deposited upon the walls and wood-work. The cream rises with astonishing rapidity, and is of a firm consistency, which admits of its removal in from 12 to 24 hours, leaving the residue quite sweet.

It is desirable *not* to have a skin form upon the milk. This "skin" is made of the coagulated albumen of the milk, and when the milk is scalded in the pans, in the way sometimes practised, it is entangled in the cream, removed with it to the churn, and remains in the butter. When the butter is sold for immediate use the evil thus caused is not noticed, but it seriously impairs the keeping, when the butter is put down for future use or sale. I think it best to strain out of, as well as into, the scalding kettle, to insure the removal of all coagulated matter.

BENEFITS OF SCALDING MILK.

This method of scalding secures perfect butter, not only during the hot months of summer, but also during the cold weather of winter when quite as much difficulty is experienced in making good butter, in the old way, as in the summer. It prevents alike the hasty souring, before the cream is up, in summer, and the bitterness so often developed by the long setting of winter. By its effect of hastening the rising of the cream, all the inevitable evils and losses of delay are avoided, and a uniform make secured at all seasons.

THE PHILOSOPHY OF IT.

I have been interested in studying into the philosophy of both this and the cold method of setting milk for cream, and think I have reached its rational explanation. It is well known that large-globuled milk throws up its cream quicker and more perfectly than that which holds its fat more finely divided. Now, the effect of scalding is simply to enlarge the globules by coalescence, or running together. At the temperature of the milk when drawn from the cow—about 98 degrees—the butter-globules are not perfectly fluid, but when it is heated to 135

degrees, the globules which come in contact will unite, forming larger globules. These enlarged globules not only rise quickly, but by their superior attractive power draw up, so to speak, the smaller globules, and thus hasten the rising of all the cream.

A FALLACY EXPLODED BY AN EXPERIMENT.

I will mention, in this connection, another matter which perhaps I ought to have treated in my article on "Dairying Fallacies." It was for a while asserted that, when the cream of large-globuled milk is churned with the cream of small-globuled milk, the former will "come" first, and that a second churning of the residue will give a second mess of butter. But careful experiment entirely disproves the assertion, and the reason is plain when we understand the attractive power of the large over the small globules. I recently, in a course of experiment upon this point, carried it a little further, as follows: After churning a quantity of cream, sufficient to about half fill the churn, until the united globules began to be visible to the naked eye—i. e., until the butter had begun to "come," I poured in several quarts more of cream, and in five minutes more, when the butter was "gathered," I had all the butter from both messes of cream. The attractive power of the pin-head masses of butter had, in that brief time, gathered in all the globules of the added cream. To insure the success of such an experiment, the temperature of the cream in the churn and of the added cream must be just right—from 60° to 65°—and the final churning rather slow than rapid.

Orleans Co., Vt.

The Herdsman.

FORAGE CROPS FOR STOCK.

In the North rye can be sown for a forage crop next spring, and by manuring highly and using an extra bushel or more of seed per acre, if mown about the middle of May, it would be very valuable for horses, cows and any kind of live stock when given to them so as to keep them off the pasture. Then, if corn were planted as soon as the rye is mowed, the ground being merely plowed the same as if it had been in grass, the manure which was put on in the preceding autumn would benefit the corn nearly as much as if the rye had not intervened, because the ripening process would not have commenced, and it is a well-known fact that green crops not matured are a benefit to the soil when plowed in, and extract from it comparatively little of its fertility, even when cut or browsed. In the South, rape might be sown on all grain stubbles where no grass-seeds are growing, and as the winters there are comparatively mild, the rape would make an excellent crop to be eaten by cattle and sheep.

As the grain is harvested so early in the South, it seems a pity to have the land lying idle for more than half a year when there are crops of several kinds which can be grown to feed a great deal of stock, and the pity of this is all the greater now that stock-raising will pay so well in consequence of the market for meat in Europe. Now, by growing numerous green crops, some for the latter part of the autumn, some for early and some for late winter, and likewise something for early spring, stock of all descriptions in the South can be kept in a thriving condition without any expense for attendance or for food of an expensive kind.

If turnips are drilled, the seed run thick and some fertilizer placed in the same channel, or if the fertilizer happens to be a very strong one, then if it is put about two inches right under the seed, the fly will not attack the turnips, or, if it should, they will outgrow the injury. Turnips should always be drilled, as they can then be cultivated and kept clean at much less expense, and, moreover, they can be thinned to a regular distance apart. It was with astonishment the writer saw in a journal of high standing, a statement from some fool of a writer, to the effect that twenty tons of small swedish turnips were better than forty tons of large ones. Such an assertion is altogether at variance with my practical experience, for a large swede, from eight up to twelve pounds' weight, is far preferable to little two-pounds roots, which are as troublesome again to get up and to cut for sheep or cattle.

It is extraordinary how little the growing of roots is understood in the United States, and how little their value for feeding to stock is known; but as there will most certainly be a regular, uninterrupted export of meat, and as mutton, before long, will be in great demand, swedes and turnips will be grown extensively, as they can be obtained very well after grain crops, the former after white peas have been harvested, and the latter after wheat, oats or barley.

G. G.

SALE OF JERSEY CATTLE.

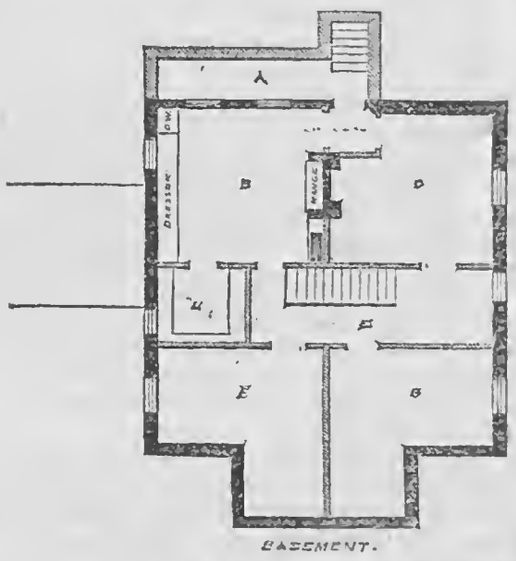
Messrs. A. M. Herkness & Co. of Philadelphia, sold at auction on August 27, Mr. P. H. Fowler's recent importation of Jersey cattle. Two of the consignment, Lovely and Light, died before the sale. The following memorandum of prices and purchasers has just been received: Mr. J. R. Way, Avondale, Pa., bought Belle, $500, and Favorite, $310. Mr. Chas. L. Sharpless paid $400 for Reindeer Second, and Mrs. W. N. Rogers, Wilmington, Del. secured Red Rose for $300. Col. Webster, Belair, Md., bought Queen for $360. Mr. Fred. Ward secured Snow, ($350), Young Bute ($340), and Janette ($280). D. Lippincott took Nankeen at $300. W. J. Clinn, Frankfort, Ky., paid $285 for Egypt Lass, $270 for Beauty, and $220 for Florence. He also paid $65 for Beauty's heifer calf. M. Wilcox, Ivy Mills, Pa. Duchess, $260. Pretty Maid, $270. Geo. Campbell, Manyunk, Pa., Mermaid, $335. J. M. Trainor, Linwood, Pa., Rosa, $275. J. E. Ridgway, of Philadelphia was the largest buyer, taking seven animals whose aggregate price amounted to $2,065.

Rural Architecture.

A MODERN SWISS COTTAGE.

L. F. GRAETHER, C. ENG.

The building represented in the attached cuts, is nearly square in plan, being 30 ft. 10 in. front by 36 feet in depth, exclusive of piazza, bay-window, &c. It consists of two stories and basement. It will be observed, that the elevation as well as the apartments on each story (see plans) are arranged symmetrically to the center line of the building. The house is supposed to front towards the south. The interior is laid out as follows:



Basement: A, area, with outside steps to the basement, at the rear; B, kitchen with pantry; D, kitchen containing dumb-waiter, range, &c., boiler, sink, &c.; C, wash-room; E, passage with stairs to first story; E and F, cellars for general storage.

First Story: A, porch; B, main hall, (7 ft. 2 in. by 15 ft. 4 in.), containing main flights of stairs to the upper story; C, parlor, (14 ft. 6 in. by 15 ft.) with bay-window, D; E, conservatory, (7 ft. 2 in. by 12 ft.); F, passage with wash-stand and closet, as shown; G, dining-room, (13 ft. by 14 ft. 6 in.) with dumb-waiter H to kitchen; J, open veranda communicating with dining-room; K, sitting-room, (13 ft. by 14 ft. 6 in.); L, veranda in rear of the building.

Second Story: A, hall; B, chamber, (14 ft. 6 in. by 15 ft.) in communication with the balconies D, and C and C; C, C, balconies; E, E, bedrooms, (7 ft. 2 in. by 10 ft.); G, G, bedrooms; F, bath-room; H, closet room which may also be used for a children's bed-room. Closets are plentifully provided, as will be seen by examining the plans.

ELEVATION.

The cost of the building will be, where materials and labor are about the same as in the neighborhood of New York city, from $3000 to $4500.

The Poultry Yard.

POULTRY BREEDING—No. 4.

A. M. VAN AUKEN.

NESTS FOR SITTING HENS.

I have now come to the period of setting hens; my process is neither new nor strange, but I consider it good. I have the nests in the central room of the layers' house. In each corner are twelve nests, made as shown in Fig. 1. The bottoms of the lower nests are two feet from the floor, and each nest is 12x12x18 inches.* The bottoms are of boards, and the backs, sides and partitions of wire netting, those where the line is dotted being fine and the other three partitions of coarse meshes, an inch or so in size. The backs and ends are of fine net, and there is to each nest a front that fastens in with buttons, and this also is made of fine net. In front of each nest is a strip, three inches high, to keep the eggs from rolling out, and level with each nest there is a sort of a step on which the fowls will fly and so step into the nests carefully, instead of flying right into them and breaking the eggs or killing the chickens. By having the sides and ends of the nests of wire net, a good circulation of air is obtained, and the fowls will not pant and show distress in hot weather as they must when forced to sit in close boxes, and, moreover, the eggs will hatch much better.

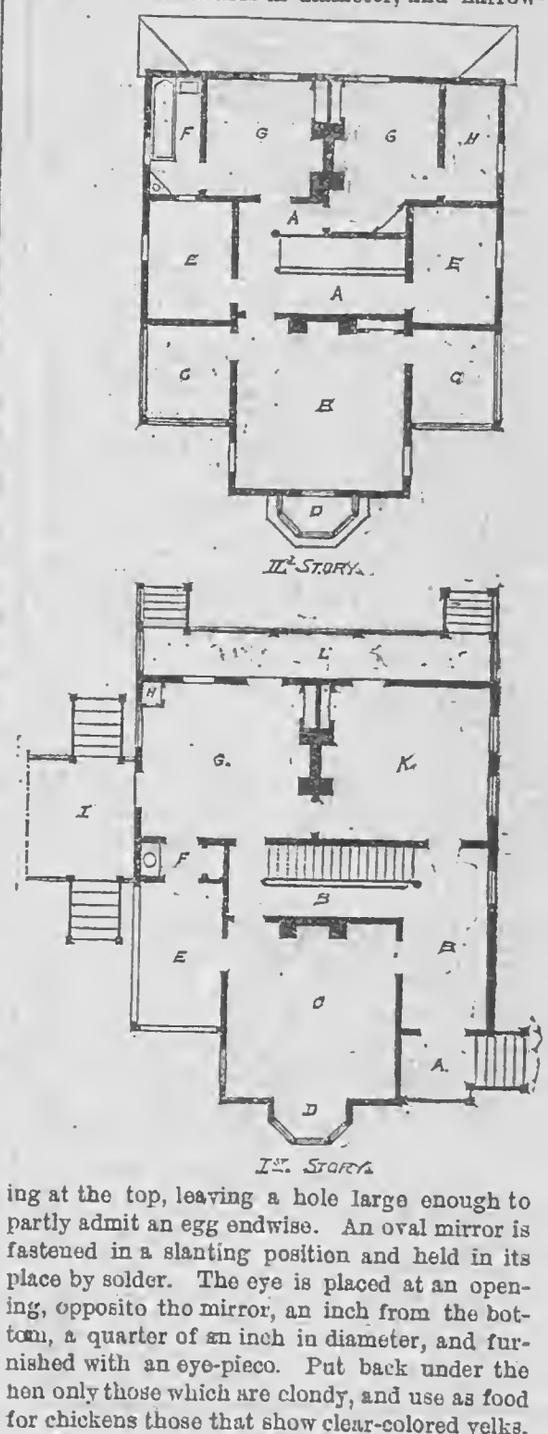
The nest for the sitter should be made of damp earth packed in a concave shape. The earth should be covered with straw bruised and broken short. It should not be cut with a machine, as in that case the sharp points will injure the tender skins of the hen and chickens. If the straw is left long, it will become tangled in the feet of the hen and cause her to break her eggs. In cold weather a folded newspaper should be placed next to the earth, or the nest be lined with feathers. Eggs in these nests need not be sprinkled, unless they are those of ducks or geese, as the moist earth will absorb no moisture from them, as does the straw generally used in nests.

TREATMENT OF SITTING HENS.

Always set two or more hens at the same time and set them in pairs, one on each of the adjacent nests separated by the coarse wire partitions, placing 13 or 15 eggs under each hen. The two hens separated only by the coarse meshes, grow very familiar, and when the chickens are hatched the two can be placed in one coop, as is described hereafter.

In each room are four sets of nests each containing 12 nests, or 48 in all. In order to enable each hen to distinguish her own place, put under one frame of nests the feeding hopper; under another the dust bath; under the third a box of gravel and charcoal, and leave the fourth without anything under it. Then the nests at one end of the frame may be painted red; those in the center white; and those at the other end black. With this arrangement the hens will be able to find their nests without trouble. Yet I prefer, as a further precaution against my hens making mistakes, when setting them, to put a daub of paint of the same color as the section where they sit; on the tail, if in No. 1, on the wing, if in No. 2; on the back, if in No. 3, and on the breast, if in No. 4. By this plan one can tell at a glance whether his sitter is on right or wrong. The nests should be closed at night by means of the wire door, in order to keep the rats away; then opened again in the morning, and left open all day.

When the hens begin to want to sit, put two in nests adjoining and separated by the coarse wire, as already directed; put five or six wooden nest-eggs under them and shut them in by fastening the wire doors. Do this after dark, and in a few days your hens will be "at home," and you may put the eggs under them. After ten days examine these by holding them between your hands and trying to look through them at a strong light. A better way is to use the "egg tester." This is a tin cup three inches high and two and a half inches in diameter, and narrowing at the top, leaving a hole large enough to partly admit an egg endwise. An oval mirror is fastened in a slanting position and held in its place by solder. The eye is placed at an opening, opposite the mirror, an inch from the bottom, a quarter of an inch in diameter, and furnished with an eye-piece. Put back under the hen only those which are cloudy, and use as food for chickens those that show clear-colored yelks. By this plan the hens do not waste their vitality on worthless eggs; for, if several are sitting at the same time, all the old eggs can be given to some, and fresh eggs placed under the others. While the hen is sitting, she should be fed entirely on whole corn. Ground feed will cause her to soil her nest, and no other whole grain that I have tried, has given satisfaction. Under the nest, with your feed-box, have a pail of water.



*For plans, see RURAL last week.

When the chickens begin to hatch, they should be visited once or twice a day, and all pieces of egg shell should be removed from the nest, else they might cover some of the other eggs and imprison the chicks. Let these stay in the nest from 24 to 36 hours after they are hatched, and then remove them to a coop.

Brown Co., Wis.

TO PRODUCE HEAVY FINE AND WHITE FLESH POULTRY.

We translate the following from a late German paper: "Use for their feed only flour of fresh grain and mix the paste with salt water, (3½ ozs. of salt to 1¾ pints of water.) Mix with the paste a small quantity of rough sand to assist digestion; feed your poultry at least twelve hours before you intend to kill. Poultry if killed during the progress of digestion, will keep, at the most, only eight days. Don't be in a hurry about pulling the feathers; if they are pulled before the blood is curdled, the duct on the end of the feather will fill itself with blood and the skin will consequently look stained. By observing this rule, poultry will keep, even in moderately mild weather, from two to three weeks, and a great deal longer in cold weather; the keeping quality of the meat may be increased yet more by filling the inside with small pieces of charcoal."

ANOTHER REMEDY FOR GAPES.

Mr. Hale's cure for gapes in chickens is a good one, so far as it goes. It is not at all difficult to perform it. I suggest dipping the feather in spirits of turpentine—one insertion will be sufficient—and the practitioner will never lose a chicken. A Blue-grass straw will answer the same purpose, and in some respects is better. The seeds should be stripped off and only a few branches left, and by inserting this, the same as the feather, and twisting it, the worms will be entangled with the straw, and when the latter is pulled out, the former must also come. The turpentine will not hurt the chicken but will most certainly kill the worms. The chicken should be operated on as soon as the disease shows itself. Don't wait until the chick is dead to doctor it.

SATURDAY SEPT. 7, 1878.

GET READY FOR THE FAIR.

The season for agricultural fairs is fast approaching. While viewing the products, or after visiting an exhibition, we have often heard the expression, "I could have beaten that myself, and not half try." A farmer is hardly entitled to the name "enterprising" who does not show something, and help to sustain the fair which is held nearest his farm. He should take pride in raising something nice, and then have enough public spirit to show his success to the world.

For an exhibition it is of first importance to produce worthy articles. To help this along, all small and worthless specimens should be thinned early from trees or plants which are expected to produce the samples. The poor or small pears, apples, peaches, squashes, or other fruits or vegetables, tax the strength of plants nearly or quite as much as large, fine specimens.

The effort of any person to prepare objects nicely for the fair, is worth all it costs. Attention must be given to the best modes of exhibiting. This applies to almost anything, from a plate of potatoes to a half bushel of wheat, from a coop of chickens to a few cut asters. Victory is not always best for any one. He may receive more benefit from an honorable defeat, than from a just prize. The failure may not be quite so gratifying to think about, but it should only stimulate to greater effort.

In showing fruits, select perfect or nearly perfect specimens, or none at all. Make it a rule to select them of uniform size and color, with full stems, without bruises, and under *no circumstances* should a wormy specimen find its way to be fair.

We have seen men complaining and surprised that they did not receive the first premium, when their fruit was large and showy. They failed to consider that he specimen which capped all the rest, was badly worm-eaten, or had a large bruise on its side, or was in some way defective. He who will not learn from such lessons, must be subject to frequent defeats. The objects should be plainly labeled with cards which cannot be easily removed. Be on hand to show the viewing committee, and answer any of their questions. To secure space in a good position, be on the ground early, and apply beforehand.

Upon those who manage our fairs rests a great responsibility. They are anxious to draw a crowd and to make it pay. These are the two chief requisites. In too many cases the officers resort to giving high prizes for the trotting and running of fast horses. This is thought to be a sort of necessary evil. For the encouragement of those who would like to see this practice abandoned, we can say that we know of several State Associations and numerous smaller ones, which have drawn larger crowds and have made more money since they dropped the prizes for fast trotting.

For the success of fairs it is also very important to secure disinterested, competent and honest judges. Nothing gives better satisfaction. To assist the judges, articles must be ready in season. They must be placed near each other for careful comparison. Judges will have some rules or scale of points to help them in making a decision.

Let every one, whether he is an exhibitor or not, take a note-book and pencil, and make a careful record of anything which he considers valuable. In this way he can collect addresses of exhibitors; he can afterwards study over the fair, and will recall many things of interest.

We cannot close without calling the attention of farmers to one question. Who run the agricultural fairs of our States and counties?

As we glance over the long list of officers with whom we are acquainted, it is surprising to see how small a proportion are farmers. This ought not so to be. It does not sound well. It does not look well. There is something wrong somewhere. We think it does not lie very far from the farmers themselves, who have too little confidence in themselves, or too little ability to undertake responsible positions.

THE SOUTHERN SCOURGE.

According to the latest advices, Yellow Fever is spreading disastrously throughout the whole of the lower Mississippi Valley. Many small towns and villages that had hitherto escaped the plague, even throughout former epidemics, have been sorely afflicted by it during the past week, and fears are daily growing stronger that the greater part, if not the whole of the South, will, this year, suffer from it. Numerous prophecies that, in accordance with experiences during former visitations, the ravages of the pestilence would gradually diminish after the middle of August, have proved entirely fallacious, inasmuch as this morning's telegrams from all the large cities show a steady increase in the number of new cases as well as in the number of deaths. In New Orleans, for instance, the number of new cases, yesterday, (Sept. 1st) was 260, against 234 on Saturday, while the number of deaths ran up to 88 against 48 the previous day. In Memphis the fatality was still heavier, amounting to 89 within the twenty-four hours ending last night—a terrible list, in view of the fact that all of its 70,000 inhabitants that could get away from the stricken city, had already done so. In the little town of Vicksburg, 1,600 deaths are already reported, of which twenty-five occurred yesterday. Grenada has been depopulated, seven healthy persons alone remaining in the place yesterday, while the dead and dying lie side by side in some of the houses for hours before the few able to attend to the matter can bury the former or minister to the latter.

Of the nurses, who in yellow fever cases are more valuable even than doctors, a great number have already been worn out by their labors or prostrated by the disease, while others have either fled panic-stricken from the scenes of death and desolation, or been called home to the bedsides of their own afflicted families. The doctors, who from all parts of the country have responded nobly to the calls of humanity, have been suffering severely for their heroism, many of them having already died of the pestilence and still more lying now at death's door from the same cause. Yesterday there were ten physicians dangerously ill from the malady in Vicksburg alone. More heroic than the nurses who serve for money, or than the doctors whose professional instincts urge them to the bed of sickness, are the hundreds of noble men, who taking their lives in their hands, minister by day and by night to the plague-stricken strangers as well as to the poor and to all in need of their assistance in every town in which the pestilence has made its appearance. Quiet merchants, mechanics and business men are these in ordinary life, men in whose character to the common eye there is little that is heroic, but it requires as much courage, and perhaps more, and that of a nobler kind, to face a painful death hourly as these do, amid the discouragements of squalor, suffering and misery, than to risk one's life at the cannon's mouth amid the crash, glory and madness of battle.

Wherever this terrible epidemic afflicts society, want and misery intensify the misery of fear among those of the working classes who escape its attack; while the fate of the poor who are assailed by it, is generally sealed unless aid comes to them from the humane, the generous and the charitable. It is to the credit of many of those possessing means in the stricken localities that they not only give of them freely to their poorer neighbors, but also very frequently are foremost in all offices of personal service and attendance. In the midst of so widespread a calamity, however, the aid of the whole nation is urgently needed to alleviate the sufferings and lessen the fatality throughout the afflicted region, and it is sincerely to be hoped that the farming community will not be backward in generously responding to the call equally of humanity and Christianity.

THE SMALL FRUIT FESTIVAL.

There is probably no branch of horticulture that to-day excites a greater degree of popular interest than the small fruits. Strawberries are enjoying more than a full share and there is something of a mania among cultivators to produce varieties bearing larger berries than any so far known. But the mania is not a dangerous one and we shall all of us ere long be ready to acknowledge that an increase of size is a poor compensation for a loss of vigor, quality or productiveness.

But we are glad of the increasing interest in small fruits. We know of many village gardens, that, though tastefully arranged and planted with ornamental shrubs and trees, are yet destitute of small fruits, and we know of many other gardens in which weeds are the prominent plants, that could easily be made to produce enough of currants, gooseberries, strawberries, blackberries and raspberries to supply the tables of the improvident owners during the season. Farmers, too, if we may judge all by those of our neighborhood, are not alive to their best interests in this matter. Altogether there seems a wide margin for the growth of small fruit appreciation, and we certainly hope that those who have cultivated the best varieties for sale, will realize a long and remunerative compensation for their zeal, patience and industry.

We have spent days in the preparation and collection of the articles and illustrations presented this week, and we have placed before our readers, without the slightest regard to whose individual interests are harmed or helped, all the facts which we have, from personal observation and correspondence, been enabled to glean. It will be observed that in more than one instance the statement of one writer contradicts that of another. Such seeming contradiction will always occur among fruit culturists. No matter how high the authority, his personal experience can never be accepted as an unqualified guide to others who cultivate the same fruit under different circumstances of soil, climate, &c.

EARLY AUTUMN LEAVES.

It is not usual to see "Autumn leaves" as soon as the first of September. Yet upon Liquidambars, Sumacs, Swamp-Maples, Sour-gums and some others, they might have been seen hereabouts ten days ago, This was to have been anticipated. The leaves of many trees developed three weeks earlier than usual in the spring, and they may be expected to die earlier than usual.

The fall of the leaf is not dependent upon frosts or other vicissitudes of the weather, but is due to causes which begin with its very formation and culminate when it is of no further service. All have noticed the lime which is deposited in tea-kettles where what is termed "hard" water is used. Water, as it passes through the soil, dissolves a small quantity of earthy matter, and is absorbed by the roots of plants and thence carried to the leaves where as the water is exhaled pure, the silex, lime, potash, magnesia, &c., are left to incrust the cells, just as the sides of the tea-kettle become incrusted with lime after considerable use. This deposition of earthy matter finally clogs up the cells so that they can no longer perform their functions. First, therefore, they lose their green color—the color of health—assuming various hues, and then loosened by the wind, rain or by merely the pressure of the axillary bud that has been matured for another season's growth, they fall. We may, therefore look for autumn leaves earlier than usual and we may also look for an earlier fall of the leaf than usual irrespective of frosts. The leaf began its work early—has worked faithfully and will lie down to rest betimes.

STRAWBERRIES.

It will be seen that Crescent Seedling is generally praised; that Sharpless is praised by Mr. Parry, who also gives some interesting figures as to yield of other varieties. Mr. Brownell still thinks that Wilson "heads the list for hardiness and productiveness." Mr. Lovett says the Sharpless was the largest and handsomest berry he fruited last season, and the plant is of the most robust growth. He speaks in high terms of Miner's Great Prolific. Dr. Hexamer speaks a good word for Pres. Lincoln, and Crescent Seedling. Mr. J. C. Williams believes that the merits of the Champion have been overlooked. There seems to be a general concurrence in the belief that Durand's seedlings need special soil and cultivation."

Farm-yard Manures vs. Artificial Manures.—From a private letter received from Mr. J. B. Lawes we take the liberty to print the following:

"I have just been reading a discussion on manures in one of your Weeklies. I fear this discussion which, as I understand it, is between the value of farm-yard manure and artificial manures, is not ripe for settlement at present. We have more evidence at our command than any one else, but we find extreme difficulty in closing experiments where dung has been used, owing to the slow yield of the residue."

BREVITIES.

The meadows are yellow with Golden-Rods.

E. P. Roe thinks the great needs of the strawberry are good drainage and a little more water.

Mr. M. B. Bateham believes that on his soil at least, bone dust and ashes are the best fertilizers for the grape.

Mr. G. W. Campbell calls Mr. J. H. Ricketts, the "Champion hybridizer of grapes in America, if not in the world."

Growth of the American Weeping Willow. Five years ago a young Willow was planted in neighboring grounds in a high place. It is now fifty feet in hight.

Just as we go to press we have received a strawberry article from Pres. T. T. Lyon, written at our request. We wished to present it in this number but are glad nevertheless of the opportunity of presenting it next week.

Several of our patrons who knew that this number of the Rural would be given up largely to a consideration of the best varieties of Strawberries, have favored us with their advertisements, which will be found in their appropriate places.

We have been censured by a Western journal for giving the following advice, which we take from Mr. Parry's article on another page:

"Persons about to commence growing strawberries, should try at least a dozen of the best varieties, so as to be sure and get those most suitable for their soils and locations."

If we may judge from our own tastes and from those of others who have reported to us the "Beauty of Hebron" potato is destined to take the place of the "Early Rose." We say that, planted side by side with the Early Rose, it will prove more prolific—at least ten days earlier—and will be found of a better quality. Let us see.

At the social festival of the last meeting of the Ohio State Horticultural Society, the sentiment was given: "The Ladies—the joy of our homes—the ablest advocates of horticulture, and whatever refines and elevates mankind." Response was made by a reverend gentleman who got along nicely until he attempted to quote Tom Moore's poetry. Instead of likening the ladies to roses without thorns, he asserted that the fair ones were often sharp thorns. The uproar which followed, obliged him to resume his seat.

Professor Stockbridge says that American agriculture of the past and present, is little better than a studied system of land plunder and devastation.——Chemicals are better than manure, because they may be more cheaply transported, handled and carried to distant parts of the farm, and thoroughly mixed with the soil. They are better than yard manure, because they not only enable us to grow as abundant crops with less labor, but their supply can equal any demand. They also enable the farmer to continually crop his land—sell the crops, and yet maintain the fertility of his soil.——The entire amount of yard manure made in Massachusetts, gives but six-tenths of a cord to each acre of tilled land.——The want of the hour is the breaking down of all barriers between practical and scientific men.

Literary Miscellany.

SOMEHOW OR OTHER.

E. S. J.

Life has a burden on every one's shoulder—
None may escape from its trouble and care;
Miss it in youth, and 'twill come when we're older,
And fit us as close as the garments we wear.

Sorrow comes into our lives uninvited,
Robbing our heart of its treasure of song;
Lovers grow cold, and friendships are slighted.
Yet, somehow or other, we worry along.

Every-day toil is an every-day blessing,
Though poverty's cottage and crust we may share;
Weak is the back on which burdens are pressing,
But stout is the heart that is strengthened by prayer.

Somehow or other, the pathway grows brighter,
Just when we mourn there was one to befriend,
Hope in the heart makes the burden seem lighter,
And, somehow or other we get to the end.

THE STORY OF A LETTER.

JULIA KAVANAGH.

(Concluded from last week.)

"You have had a useless journey, Nelly," said Mrs. Dering, coming out to join the pair, "but we had to send for you to quiet the poor dear."

"And do you really think she is safe now, Mrs. Dering?"

"The doctor says he is almost sure of her, Nelly. And how do you like your place? Your mother says it is such a good one."

Nelly answered that it was a very good place indeed; but she sighed as she remembered Sir John's warning.

"You'll be saving lots of money, and coming back to marry Joseph," continued Mrs. Dering.

"I hope so," said Joseph, cordially.

This Joseph was a very good fellow, a steady workman, and he adored Nelly, but he was not very bright, and Nelly never told him her little secret. So, even after Mrs. Dering left them and entered the cottage, she said nothing about Sir John's warning. She knew what a shock it would be to her sick mother, and suppose Joseph should let it out? Joseph was so happy to see his mistress again that he was in the highest spirits. He could talk of nothing but the future, and he could not see that future unless under the rosiest aspect. His song had but one burden to it. Sir John's twenty pounds a year, Ellen's savings, and wedded bliss.

Nelly heard him, and said not a word. She was very glad to have found her mother alive and "safe," as she said, but a darkness had come over her joy. "Poor fellow! if he knew the truth," she thought, as she listened to him, "and if he knew that every word he utters is a stab to me!" But every one seemed bent on tormenting her. Mrs. Dering came out again and extolled Nelly's place and salary. Little Jane, hearing so much about money, wanted to know what Nelly was going to give her; and when the sick woman was able to speak, her first words were an injunction on her daughter not to exceed her leave of absence. Nelly must not vex Sir John on any account. She became so excitable on this head that, to pacify her, Ellen asked if she should go away by the night train.

"Yes, you had better, my dear," replied her mother, rather eagerly.

She was as anxious to see her daughter depart as she had been to make her come. Nelly herself was not so sorry to go. The burden of her secret was too much for her. As she left the cottage, Mrs. Dering followed her out mysteriously.

"Ellen," she said, "I have some money unknown to my husband, and I want poor William to have it. You just take it for me, and he will call for it in a day or two. I can't send it by the post."

She slipped a little silky packet in Nelly's hand. "And do take care of it," she whispered again, "for it is four five-pound notes, Nelly."

Ellen hesitated. William, Mrs. Dering's son by a first husband, had been so beaten and ill-used by his stepfather that he had run away to London years before. But misfortune had followed him, and he was now a sickly widower with three little children.

"You cannot refuse doing that for me," said Mrs. Dering.

"No, no, Mrs. Dering, I will do it with pleasure. But it is such a large sum—suppose I should lose it."

"You'll not lose it, Nelly; there, take it, and do not tell any one."

"Any one" meant Joseph, who now came up to escort Nelly to the station. They walked along the shady lane, arm in arm, and, as they had plenty of time, poor things, they lingered. Nelly felt much depressed when they parted at the station, and Joseph saw it.

"You are fretting about your mother," he said. "I am sure she'll do, Nelly; but I'll be sure to write."

"No," said Nelly nervously, "no news is good news—only write if she gets bad again."

Nelly had her reason for this. "How should I bear the suspense if Sir John was out?" she thought. But Joseph said, a little shortly, "Very well, when I write you will know it is bad news."

Nelly wanted to explain, but she had no time to do so. The train was going to start.

"Make haste," said Joseph, hurrying her away. "It is only writing him a line when I get to London," thought Nelly. "Poor Joe! he was hurt."

An accident which had taken place on the line delayed the train, so that it was nine in the morning when it reached the station. Sir John lived at the other end of the town, and it was ten by the time Ellen got to his house. James opened the door for her, and very cross James looked. The poor fellow had been kept on duty almost the whole time she was away.

"A pretty mess you made of it, ma'am," he said, with sarcastic politeness, "and a nice way poor Sir John and I have been in all the time."

"I have not been twenty-four hours away, James," answered Ellen, "and if you will just let me go up and change my dress, I shall be down directly. You can tell Sir John so."

"Sir John is out," was the short reply. "How's your mother," he added, more kindly.

"Much better, thank you."

If Nelly had said "Much worse," James would have been softened thoroughly, but "Much better" showed what a perverse, tormenting little creature she had been; so he roughly bade her not be long; and when Ellen came down he did not wait till she reached the bottom of the staircase to go out of the front door. Ellen entered the parlor, and went and sat down in her usual place. She felt giddy with fatigue, and her first feeling was to long for more complete rest than of waiting for Sir John's letters. Suddenly she remembered Mrs. Dering's twenty pounds. Ellen rushed up-stairs like a mad thing. She searched the clothes she had just taken off—no trace of Mrs. Dering's money did she find. It was lost; that money which the poor mother had taken years to put by for her sick son and his three children was utterly lost.

Ellen's first feeling was one of stupor; then she asked herself the usuual question: "What am I to do?"

Ellen had been ten years a servant. She had to help her mother and her little sister; she had not saved much money; fifteen pounds and ten shillings in all. That money she must now give up to Mrs. Dering, and yet it would not cover her debt. But could Mrs. Dering's money be really lost? It seemed impossible. She searched again with renewed ardor, but the money she had not. She could not imagine how or when it had left her possession—in the lane, on her way to the station, in the railway carriage, or in the cab that had brought her to Sir John's door; but one thing was sure, she had it, and she had not got it now. To the rich the loss of money is generally light; to the poor it is almost always calamitous. In a moment all the consequences of Ellen's loss rushed to her mind; Mrs. Dering's son must suffer, then Nelly herself. Adieu to many little comforts; adieu to love; adieu to hope itself. The poor girl could not bear these thoughts. She flung herself on her bed and burst into tears. But she was not even allowed to indulge her grief. The postman's knock at the door below reminded Nelly that in her own concerns she had forgotten her master's. She flew down-stairs, and she reached the door just as the maid was opening it. Mary looked anything but charmed at Ellen's hasty appearance, and, turning up her nose, she said scornfully, "Perhaps, ma'am, you'll be kind enough to let me have my letter." "There is none for you," replied Nelly, glancing over the letters which the postman had put in her hand; "but, oh, my goodness, there is one for me!"

It was a letter from Joseph, with the London postmark. With a trembling hand Ellen was going to break the seal, when Mary's mocking eye fastened upon her reminded her of her promise. She had forgotten all about it, but she remembered it now: she could not open that letter till she received it from Sir John's own hands. And Sir John was out; he would not come back till dinner-time.

Ellen entered the parlor and sat down, with the letter on her knees. She looked at it as surely letter was never looked at before. Within that square envelope lay Nelly's fate: Either Joseph had written to say that her mother had had a relapse — how she remembered his words. "When I write, you'l know it is bad news!"—or he had despatched this letter, following so close on her steps, to tell her that Mrs. Dering's money was safe: The very London postmark was a sign, only it could be read either way. It was plain that something had occurred just after her departure, and which Joseph, on reaching home, had wished to impart to her. He had evidently found some one going to London by the early morning train to whom he had given his letter that she might get it half a day sooner. Yes, all that was plain enough, but it helped her nowise to a solution of the mystery. Joseph knew nothing about Mrs. Dering's money, and, as the lane was dark when he went home after parting from her, he could not possibly find four five-pound notes. Moreover, Nelly searched her memory well, and she was sure that she had not once put her hand in her pocket whilst Joseph and she walked to the station. Then the letter could not refer to the money; it must be to tell her that her mother was worse, and that she, Nelly, must go back at once!

When this thought came to her, Nelly's hand was at once on the letter ready to break the seal, but she remembered her promise, and she paused. What if the letter only referred to the money? What if it was only being patient and doing her duty? For it was her duty. Sir John had given her warning, but she still was his servant, and she still owed him obedience. She had made a promise which she was free to withhold, but, having

A CITIZEN OF MEMPHIS.

made it, she was not free to break it. Poor Nelly! I have often wondered how she resisted such temptation. For do not suppose that Satan did not offer her many an outlet.

"Break the seal," he whispered, "read your letter, then go up-stairs, seal it again with red wax like this, and just tell me if Sir John will be any worse for it? It is your letter after all! Think of your long agony till he comes home, and do this: who will be the wiser?" This was cruelly plausible, and are there many men and women who could have resisted either that suggestion, or the bolder or more honest one of breaking her promise altogether, and not concealing from her master that she had done so? What had Nelly to lose? He had given her warning; this fine situation, with its twenty pounds a year, was gone; she had risked it to comply with her sick mother's wish, and she did not repent having done so. Why should she not win peace when all was lost and risk was gone?

Why are not conscience, integrity, and honor mere words, and not awful realities? Nelly could not do this thing. The sacredness of her word stood between her and Paradise. For, after all, her reading the letter would change nothing. It would not give her dying mother life, or restore Mrs Dering's lost money. "Well, then, I must and I will bear it," thought Ellen.

And she bore it. What tortures Nelly suffered, as she sat in that dull parlor on a sultry July day, with Joseph's letter on her lap, she never told—perhaps she could not. Great mental or physical pain can never be remembered in its intensity, for to remember it would be to go through it again, and Providence is too merciful to inflict the same pang twice over. Still, it must surely have been something terrible for the poor girl to let the slow hours go by and hear the kitchen clock ticking below. Cook and housemaid were very merry together that day. How cruel and how mocking sounded their loud laughter and their idle talk! If she could even have told them her trouble, it might have eased her. "But they hate me," thought Nelly, her heart swelling at the thought. They certainly did not love her, and, though Nelly was a good girl, she had little, short, precise ways which free, easy, unscrupulous natures must dislike. Not a soul came near her. She sat unheeded and forgotten, neither eating nor drinking nor stirring—but looking at Joseph's letter on her lap and feeling: "Will he ever come?"

When the hour of Sir John's return drew nigh, the suspense grew to be almost intolerable. There was nothing which poor Ellen did not imagine. Suppose he dined out: suppose he did not come back till the morning. Could she or ought she to bear it? Surely, in such a case, she must be freed of her promise. She had never pledged herself to an indefinite waiting.

Sir John was the most punctual of men. He dined at six exactly. Yet at five minutes past six he wasn't at home. "He is not coming home to-day" thought Ellen. Her hand was on the letter; but she paused. "I shall wait till the clock strikes the quarter," she thought, "then I shall see what I am to do."

She had not to wait so long. At ten minutes past six Sir John's knock was heard. Nelly ought to have flown and opened to him, but she did not. Now that deliverence had come, she shrank from it as if it had been a calamity. She never stirred till Sir John entered the room, and seeing her, rather shortly asked, "Any letters?"

Nelly placed all the letters in his hand. He saw hers, and gave it back to her without a word. Nelly took it and left the room. Sir John was a slow, deliberate man. When one of his letters was sealed, he never broke the seal, but cut the paper round it. He rang the bell to ask Nelly for a pair of scissors. She came in staggering, and before Sir John could utter his commands, Nelly was in a dead swoon at his feet. "Bless my soul! what is the matter with the girl?" cried poor Sir John, very much startled. He picked her up and, in so doing, saw a little bit of rumpled paper in her hand. I trust no one will think the worse of Sir John for looking at that paper. It was a short missive—and ran thus: "Money is all safe; mother is getting better and better. Yours truly.

"J. M."

So it was all right; but the sudden relief had been too much for Nelly. This, however, was Greek to her master. So he rang the bell, and, thanks to water, vinegar, and burnt feathers, Ellen was got round. But she was so weak by the bitter suspense of seven hours that it was some time before she could answer Sir John's questions and tell him her story. She related it very simply, but he heard it with the deepest amazement. "By Jove," he cried, "there was never anything like it—never! And so, not knowing but that the money was lost or your mother worse, you would not read the letter."

"No, sir," quietly answered "Nelly, "I could not break my word."

"You are a noble girl," cried Sir John, with a touch of Hotspur enthusiasm, "and I'll tell you what, Nelly, if I was ten years younger—I would marry you."

"But I would not marry you, Sir John," demurely answered Nelly.

"Of course you would not." he ruefully replied. "You would not jilt a man, and poison the rest of his life. You would not do that."

That absurd Sir John! with poisoning his life indeed! I wonder how much poison it takes to produce my worthy friend's—I will not say how many stone; or to give a man that bluff rosy face, or that hearty voice and jovial "Ha! ha!" Poison indeed!

There came another letter from Joseph the next morning, explaining everything.

Need I say that Sir John, rescinded the warning he had given Nelly, and that he authorized her to open her letters the moment the postman put them into her hand. So, though he was out, she read this one, which, as I said, explained everything. Ten minutes after Nelly had left her mother's cottage, Mrs Dering found the notes in the garden. As soon as Joseph returned she told him the whole story. At once he wrote, but it was too late for the post, so Joseph went to the station, and a friend whom he had there promised to find him a safe messenger in one of the guards, by whom his letter should be posted in London as soon as the first train came in.

"Oh, Joseph, Joseph!" thought Nelly, "if you had only written your letter outside instead of inside, what a world of misery you would have spared me."

"Why did he not send you a telegram?" indignantly asked Sir John. "But, sir," argued Nelly, "I should not have opened that either; besides the letter came as fast as myself—it was all the promise."

Yes, it was all the promise, and Sir John did his best to atone. Nelly and Joseph have been married years, and their prosperity is not the mere offspring of their labor and industry. A kind, helping hand has often been stretched out towards them. "But I owed Nelly more than I ever did for her," says Hotspur. "Would you believe it, sir, ever since that girl left my letters have gone wrong again!"

I have no doubt Sir John would like me to believe *that*. As if I could!

SIGHT-SEEING IN PARIS.

E. F. MOSBY.

NOTHING at the Paris Exposition attracts more attention than the Gobelin tapestries and the Sevres china. One is disappointed at first by the royal tapestries and hangings, for the colors, especially the scarlet or rose tint, have faded very much, but the fidelity with which line after line, touch after touch of the great artist in some matchless painting, is transferred to the web, grows ever more and more upon one's admiration. It is said the weaving of one of these pieces sometimes lasted six years, the silent workman having his model or pattern placed *behind* him, instead of before, and occasionally looking back to trace its image more accurately on his memory; and one fancies in the faded tints some resemblance to the slow-passing and colorless days of patient labor spent over them.

Far brighter is the beautiful work on the Sevres china, so called from the town of Sevres, which is situated a short distance from Paris, near the town and grounds of St. Cloud. The many revolutions of Paris, the pillaged palaces and consequent sales, have caused many specimens of this royal ware to be brought into the private households of other countries, so, many of my readers are doubtless familiar with the exquisite texture of this frail china, as delicate and as translucent as the shell of an egg.

The graceful designs in which it is wrought suit the material admirably, and so do also its rare devices of brilliant colors, its flowers and wreaths and trailing sprays of blossoms. The work on the painting and gilding is most elaborate, and the china is even decorated still more expensively by the setting of brilliants or precious stones, and flowers, statues, vases, urns, are all made of this frail porcelain, as well as the exquisite sets for tea and dinner services, with which our eyes are most familiar.

There are also tall jars of Rouen china, and ware from Limoges and Nevers. Much of the early French porcelain is wrought in grotesque and quaint shapes of animals and fish, and queer creatures of land and water, with plants and flowers, exquisitely colored in fresh, bright tints. For several years persons have been busy in collecting fine specimens of china, old furniture, delicate laces from different parts of France, and as you look at some of the old china you can imagine the interiors of the tall, dark houses in the old towns of Normandy, where these were ranged row over row on strong shelves, or placed on the tall *armoires* with many compartments and drawers.

There is one thing that strikes you pleasantly about the designs on the china, and the carvings of the tall chairs and chests and slender tables—all the plants seem to grow and the birds and butterflies to live, and peck at the wooden fruit, or poise above it. It shows the vigorous, warm enthusiasm of the artists who worked upon them, and loved their work.

If you have traveled in France enough to learn something of the life of the people, you will feel a much more intelligent interest in many of the articles exhibited in Paris. For instance, the delicate black laces of Caen and other provincial towns, will recall to you the women in their picturesque peasant dresses, weaving the fine threads into symmetrical figures, and you will remember vividly their beautiful, old-fashioned towns, with their narrow streets, and tall houses with projecting rooms, and the curious, overhanging balconies, shading the sidewalks.

If you have ever been to these, there are two places you will remember—the busy marketplace with the fresh, lively peasant women, selling and bargaining with so many compliments and smiles, and their pretty stalls with fruits and dewey flowers, and even vegetables arranged with exquisite taste and neatness; the bright crimson radishes and silvery-white onion, the crisp green leaves of lettuce forming a perfect study in color by themselves. Then, after leaving a little behind you all this busy merriment and good-natured din, you will come to a quiet green yard and tall gray church, its spire rising solemnly heavenward, and its sweet bells ringing matins, angelus and vespers over the heads of the crowd coming and going underneath. The church doors are always open, and looking in you see cool shadowy spaces, only cleft here and there by rays of richly-colored light from the stained windows.

In the great International Exhibition at Paris now, the work displayed is a fragment from just such sights and sounds in many lands, and the young visitors there should try to understand the people who produced these beautiful things, and their homes and lives, to gain the full interest and meaning of them.

AGRICULTURAL PRODUCTS OF CYPRUS.

THE following statistics as to the agricultural products of Cyprus, are taken from a report furnished to the Imperial Geographical Society of Vienna by an officer of the Austrian army. Although written as far back as 1873, the report will still be found interesting, owing to the great scarcity of information regarding the island. Of wheat, which is one of its chief products, Cyprus raises in a good year about one million five hundred thousand bushels. Of these about one million bushels are consumed in the island, leaving about five hundred thousand bushels for export. The shipments commence in the month of June, and in 1872 the average price of wheat, placed free on board ship, was about 4*s.* 2*d.* per bushel. Barley is also cultivated to a considerable extent, but the bulk of it is consumed in the island; and in some localities small quantities of maize, oats, and millet are raised. Carobs, or locust-beans, are largely cultivated. The annual harvest of these varies from eight thousand to twelve thousand tons, and the fruit is generally ready for export about the beginning of September. Its price varies from 70*s.* to 140*s.* per ton, and about three-fourths of the total export goes to Russia, Egypt taking the bulk of the remainder. Of raisins, Cyprus produces annually about one hundred and fifty tons. They are of medium quality, fetch about £11 per ton, and are mostly shipped to Alexandria, Beyrout, and Constantinople. Wine is still one of the chief products of the island. About one hundred and forty thousand gallons of the common red wine are produced yearly, the retail price being about 10*d.* a gallon. Somewhere about one-third of this quantity is consumed on the island.

Of the better wines, the annual product is about eighteen thousand gallons, and these are nearly all exported. They are bought up by speculators, who store them until matured; the price ultimately realized for Commandine, which is the kind most sought after, varying from 4*s.* 2*d.* a gallon when it is two years old, to twenty times that sum when it has been kept for twenty-five years. Brandy also is made from raisins and damaged grapes, and about thirty-four thousand gallons are sent each year to Alexandria. Nearly eight thousand bales of cotton of the average weight of two hundredweight each, are exported yearly, the home consumption absorbing an additional one thousand bales. Silk used to be an important article of export, but owing to the outbreak of a disease the production has been greatly curtailed. In good years about two hundred and twenty thousand gallons of olive oil, two hundred and fifty to three hundred and fifty tons of madder root, and one hundred tons of nuts are produced. Sumach grows without particular care, and from three hundred to four hundred tons are yearly exported to England and Syria. In 1873 the total value of the exports from Cyprus was £360,000, and of the imports, £88,000, In 1875, according to our consular reports, the exports amounted to £334,000, and the imports to £200,000. Two-thirds of the total tonnage of ships trading with Cyprus belong to Austria.—*Economist.*

CLANDESTINE DOCUMENTS.

APROPOS of the recently discovered theft of an important State document a copy of which was stolen by a clerk and sold to the press, the Pall Mall Gazette gives the following interesting account of similar offences:

Historical instances are numerous in which State documents of great importance have found their way into the hands of people who had no business with them; and sometimes the course of the world's affairs has been materially influenced by such accidents. But for a hazard which placed under Cromwell's eyes a letter in which Charles I. stated that he had no intention to fulfil the promises which he had made to secure peace, the negotiations between the king and the Parliament might have come to an issue; as it was, Cromwell refused to treat, and it may be said that Charles' unlucky letter cost him his head.

Similarly the breach between Louis XVI. and the French people was rendered irreparable when a blacksmith revealed the existence of the famous iron closet at the Tuileries, which having been broken open, was found to contain the damaging evidence of the king's negotiations with the Austrian Court in view of an invasion of France. In 1794 Tallien having read his name on a piece of paper which Robespierre let fall from his pocket in pulling out his handkerchief, concluded he was marked down for execution, and at the instigation of his high-spirited wife, immediately took measures which resulted in Robespierre's downfall on the 9th Thermidor. To come to more recent times, Louis Napoleon's *coup d'etat* was within an ace of failing, owing to the officiousness of a lady in communicating the plans to Prince Napoleon (the future emperor's cousin), who forthwith tried to put some of the Republican leaders on their guard.

Victor Hugo gives an account of this affair in his "History of a Crime," and he furnishes some details as to the minute precautions which were taken to insure secrecy at the National Printing Office, where Louis Napoleon's proclamations were printed. The place was guarded by soldiers and detectives, and not a workman was allowed to leave the building until all the copies were struck off and in the hands of the bill-stickers. M. Hugo might have added that the original manuscripts of these proclamations were all in the handwriting of Count de Morny, and that no one save that able conspirator and his master was permitted to see them before they were consigned to the printer. St. Arnaud, Maupas, Mocquard and Persigny had been favored with a sight of proclamations worded quite differently, and they grumbled by and by at not having been trusted. But De Morny trusted nobody. In 1870 on the outbreak of the Franco-German war, the world was startled by the publication in the Times of a draft treaty drawn up by M. Benedetti, and proposing the annexation of Belgium to France. M. Benedetti pretended that he had been entrapped into writing this draft under Count Bismarck's dictation: but anyhow, its disclosure had a marked effect in drawing away British sympathies from the French side, and it compelled the Gladstone Administration to sign a treaty binding England to protect Belgian independence. Three years later the fortunes of the Monarchist factions in France were terribly damaged by a confidential circular of M. Beule, the home minister, which somehow fell into the possession of M. Gambetta. In this document M. Beule suggested a plan for the wholesale corruption of the provincial press out of the public moneys; and when M. Gambetta had read this strangely cynical paper in the tribune such a storm of indignation arose, both in the Parliament and in the country, that the Broglie Cabinet became hopelessly discredited. Soon afterwards M. Beule was obliged to resign, and within a twelvemonth from his resignation he committed suicide.

EGGS AS FOOD.

EGGS of various kinds are largely used as food for man, and it is scarcely possible to exaggerate their value in this capacity, so simple and convenient are they in their form, and so manifold may be their transformations. They are exceedingly delicious, highly nutritious, and easy of digestion, and when the shell is included, they may be said to contain in themselves all that is required for the construction of the body. It has been claimed for them that they may be served in about six hundred ways, although it is generally found that the more simply they are prepared the more they are approved. Although other eggs than those of birds are eaten—for instance, turtles' eggs—it is generally conceded that the eggs of the common fowl and of the plover possess the richest and sweetest flavor. The eggs of ducks and geese are frequently used in cookery, but they are of too coarse a nature to be eaten alone. The eggs of the turkey and of the pea-hen are highly esteemed for some purposes.

The weight of an ordinary new-laid hen's egg is from one and a half to two and a half ounces avoirdupois, and the quantity of dry solid matter contained in it amounts to about two hundred grains. In one hundred parts, about ten parts consist of shell, sixty of white, and thirty of yolk. The white of the egg contains a larger proportion of water than the yelk. It contains no fatty matter, but consists chiefly of albumen in a dissolved state. All the fatty matter of the egg is accumulated in the yelk, which contains relatively a smaller proportion of nitrogenous matter, and a larger proportion of solid matter, than the white. Therefore, in an alimentary point of view, the white and the yelk differ considerably from each other, the former being mainly a simple solution of albumen, the latter being a solution of a modified form of albumen, together with a quantity of fat. . . . . Raw and lightly-boiled eggs are easy of digestion. It is said that raw eggs are more easily digested than cooked ones; but this may be doubted if the egg is not overcooked. A hard-boiled egg presents a decided resistance to gastric solution, and has a constipatory action on the bowels.—*Cassell's Domestic Dictionary.*

GLADSTONE AND BEACONSFIELD.

THE Springfield Republican, discussing "The Personal Element in English Politics," sketches neatly and accurately the two central figures of trans-atlantic politics. Gladstone is the man of moral ideas, and Beaconsfield is the very embodiment of cynical expediency. Gladstone can hardly crack a filbert without somehow connecting the fact with the moral order of the universe; Beaconsfield jests over Bulgarian atrocities as if he were cracking filberts. Beaconsfield's career is made up of anomalies. Of Jewish descent, he is the practical head of the Established Church; a conservative leader, he beat the liberals by offering a wider suffrage than they had ventured to propose; a thorough political adventurer, he is obediently followed by a proud and stiff aristocracy; he is the most adroit of courtiers, and the most absolute of party chiefs.

"But consistency still was a part of his plan
He's been true to one party—and that was himself,"

He has succeeded mainly by giving to a strong and stupid party the benefit of leadership as skillful as unscrupulous; and also through the sympathy of a class—which the Pall Mall Gazette represents—with the cynical indifference to anything but material success which the prime minister so jauntily avows. Nothing is more detestable to this class than the intense and serious temper of a man like Gladstone. Gladstone is deficient in the qualities in which Beaconsfield is strong—tact, coolness and self-control. But it is the best head and heart of England that listens and responds when Gladstone speaks. Beaconsfield is, after all, but the cleverest of charlatans. Gladstone is a statesman, of a lower order indeed than Bismarck and Cavour and Lincoln in shrewdness and particular force; an orator and scholar, rather than a man of affairs; but second to none in the purity of his aims and the generosity of his sympathies.

"I'VE bought you a nice Swiss clock, mother," said an old farmer to his aged wife. "Why, Jared!" she exclaimed, "why didn't you bring me an English or American one, so't I could understand it when it strikes?"

BRIC-A-BRAC.

DOT LEEDLE LOWEEZA.

How dear to dis heart vas mine grandshild,' Low-
eeza!
Dot ehveet leedle taughter off Yawcob mine son!
I nefer vas tired to hug and to shqueeze her
When I vas avay, oh, I know dot she miss me,
For vhen I come homevards she rushes bell-mell,
Und poots oup dot shveeet leedle mout' for to kiss
me—
Her "darling oldt gampa," dot she lofe so vell.

Katrina, mine frau, she could not do mitoudt her,
She vas sooch a gomfort to her day py day;
Dot shild she make efry von habby aboudt her,
Like sunshine she drife all dheir droubles avay;
She holdt her vool yarn vhile Katrina she vind it,
She pring her dot camfire bottle to shmell;
She fetch me mine bipe, too, vhen I don'd can find
it,
Dot plue-eyed Loweeza dot lofe me so vell.

How ehveet, vhen der toils off der week vas all
ofer,
Und Sunday vas come mit its quiet und rest.
To valk mit dot shild 'mong der daisies und clofer,
Und look at der leedle birds building dheir neet!
Her pright leedle eyes how dhey sparkle mit pleas-
ure—
Her laugh it rings oudt shust so clear as a bell;
I dink dhere vas nopody haf sooch a treasure
As dot ehmall Loweeza, dot lofe me so vell.

Vhen vinter vas come, mit ite coldt, ehtormy ved-
dher,
Katrina und I mue sit in der house
Und dalk off der blast, by de firesIde togedder,
Or blay mit dot taughter off our Yawcob Strauss.
Oldt age mit its wrinkles pegins to remind ue
Ve gannot shtay long mit our shildren to dwell;
But soon ve shall meet mit der poys left pehind us,
Und dot shveet Loweeza, dat lofe us so vell.

[Charles F. Adams in Detroit Free Press.

EVERY one remembers that when Flaxman told Sir Josbua Reynolds that he had espoused the amiable and accomplished Ann Dolman, the great painter replied: "Oh, then you are ruined for an artist." Mr. George Augustus Sala, touching upon the subject of marriage and art in his charming Chronique in the Illustrated London News, says: "In any case, dogmatism on the subject is dangerous; and Sir Joshua's ill-conditioned remark was possibly due to his having been jilted by Angelica Kauffmann. As for the expediency of matrimony in the case of authors, I hold that novelists and journalists should always be married men, but that poets should invariably be single. The true poet should be more or less unhappy; the more miserable he is the more sweetly he will sing; but there is no reason why, he should make others wretched."

IN THE PARLOR.

BETWEEN the dusk and the daylight,
When the shadows longest grow,
There comes a silence on all things—
'Tis the hour when one speaks low

We sit in the parlor together,
And heavily on the air
Floats the faint familiar fragrance
Of the heliotrope in your hair.

And in the kindly twilight
I see your dark eyes shine;
I feel the touch of your garments,
Of your soft white hand in mine.

And one might see in the parlor,
When the day is almost done,
On the wall two tremulous shadows
Of faces melt into one. *[New York World,*

A FEW months since a lady who is very well known in the French fashionable world happened to see in the streets of London a monkey begging pence from the public in the prettiest manner for the benefit of his master, an organ-grinder. The marquise took a fancy to it, bought it, dressed it in the gaudiest of raiment, and made it a pet. The lady the other day had in Paris a fashionable reception, and of course her pet was the wonder of the room. It the course of the evening a young lady sat down at the piano, and accompanying herself, sang with exquisite taste a little drawing-room song. As soon as the lady had finished, the monkey, who though now partially civilised, had not forgotten his former duties, seeing something near him that reminded him of his old occupation, seized it and transformed it into a temporary hat, and commenced a collection. The vocalist laughed, the marquise looked vexed, but to the amusement of everybody the animal went the rounds and collected a large sum. His task ended, he jumped upon the knee of the singer, midst shouts of laughter, and deposited the contents of his hat in the lady's lap. The collection was of course devoted to a charitable fund.

THE TABLES TURNED.

SPARE Mr. C. met stout John Ghea
Just entering the gate;
Said C., "How do you do, good sir?"
"Do? prime! Just guess my weight."
"Well, I should judge," said Mr. C.,
"You quite a weight must levy.
For, if the saying old is true,
"Sin always is most heavy.'"
"Ho, ho! ha, ha!" laughed stout John Ghea
"You're quite a joker, quite.
But you cannot weigh very much,
For vanity is light!'" L. J. B.

"Dora," said Albert to his sister, "as you are studying arithmetic, will you please tell me, if five and a half rods make a perch, how many will make a pickerel?" "I will," responded Dora; if you you will first tell me, if two hogsheads make a pipe, how many will make a meerschaum?"

How 14-8 the female I
Who has a man to love;
4 love is truly heav'n on earth,
As love is 7 above.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

HAY-MAKING.

I.

ACROSS the sunny field she went,
Who is our sovereign lady;
She said, "Such days were never meant
To waste in corners shady."
She would not take a single nay,
Excusing or denying,
"Come out," she said, "and turn the hay,
Because the sun is shining."

II.

Some pleaded letters: "Why, you see,
'Tis mail-day for Golconda!"
Another: "When I've read these three
Last pages of 'Deronda.'"
Two miscreants who had slyly fled
[Straw Hat and Dolly Varden)
Were captured, lips and fingers red,
Deep in the kitchen garden.

III.

No pleading was the least excuse,
She brooked no contradiction;
The best you cannot make excuse."
"Those letters are a fiction!"
You've played lawn tennis half the day,
Than which my work is cooler!"
And so, at last, she got her way,
Our most despotic ruler.

IV.

She set our stations row by row,
And marshalled us sedately;
"See, now, this is the way to go,
The swathes want turning straightly."
Don't seize your rakes like whips and oars,
Nor drag them limp and lazy."
The haymakers who drank their "fours"
In shadow, thought us crazy.

V.

But not five minutes' work was done,
'Ere defalcations tried her;
Dick's line and Kate's merged into one,
And Jack must taste the cider,
While some would loiter, some would play,
And some would rest already—
"Alas!" she sighed, "for all I say,
I cannot keep you steady."

VI.

Across the field there swept a tide
Of voices, songs and laughter;
She raked her line with honest pride.
I followed silent after.
We left the others far behind,
O'er-mastered by the weather;
And finished where the roses bind.
The further hedge together.

VII.

What made me bold? Some words we spoke
By chance; or silence sweeter;
While all the summer sounds awoke,
And sang in tender meter.
I only know, my fate assured,
I won her sweet resigning;
Nor did she blame me that I made
Hay while the sun was shining.

[The Argosy.

ABOUT CLOTHES.

I MAY as well say at the start, to prevent misappre ension, that this is *not* to be a fashion article. "Fashion and style," what a world of ill-health, discontent, envy and vain-glory does the combination symbolize!

I'm interested in the effort now being made to cultivate rational ideas on the subject of how women shall be clothed. I've looked in vain in the RURAL for the least hint of the approaching emancipation of women from the thralldom of clothes, but although our amiable editor has discoursed times without number about the fashion in garments, not a word has been said by her in behalf of this much-needed reform.

6321

A move in the right direction has been made in the matter of under-garments in the substitution of one or two pieces for the six or seven worn heretofore, and women have so generally adopted the reform garments and adaptations of them that, so far as underclothing is concerned, there is little fear but that the good work will go on until some gifted sister shall have evolved a single under-garment which will have all that is requisite for warmth and economy. But the outer clothes are my especial agony. To begin with: look at the head-gear that women affect. What is the modern bonnet? Does it shade the face in summer and protect it in winter? Oh! dear no. Under pain of not being fashionable it's prohibited from covering the ears. The face, head and ears are exposed to wind and sun—a style of head-garniture which looks passibly well (and even then not appropriate for street wear) on pretty, young fresh girls, but oh! what pitiable caricatures it makes of many women—ugly complexions, wrinkles, freckles, skin blemishes of every description; ill-shaped ears and faces are intensified in their ugliness by being thrust unshaded into the glare of sunlight. We laugh at the "poke" bonnets of other days, but they had at least the merit of hiding blemishes. Would I advocate a return to poke bonnets? Not exactly, but I would have women adopt some style of hat which will be of more service than the thing of lace, feathers and gewgaws now worn.

In lieu of something better, why can't a woman wear sensible a round hat—sparse front locks and wrinkled brow would then be hidden, and the tired, worn face with the disfiguring dark circles under the eyes, would be shaded.

6321

As to frocks, what can one say? The effort to popularize short skirts for the street has been partially successful, but many women are still to be seen burdened with several yards of skirt which, as it is no longer considered good form to allow to trail in the street, they are forced to carry in their hands. Then the absurdities in the way of making up gowns are enough to disgust any one who is not entirely bereft of common sense. But as this letter is already tolerably long, I'll content myself with touching only on the indelicate aspect of the way ladies costume themselves, and leave to other RURAL sisters the discussion of the idiocies in cut and trimming which spoil many a pretty dress pattern.

It seems almost incredible that modest, estimable women should array themselves so as to look rather like anatomical subjects than as though dressed for the street, and yet we everywhere meet respectable women whose clothes are so tight-fitting that their shape from neck to ankles is faithfully out-lined. Custom has long sanctioned women having the waists of their gowns fit them very snugly: that I always thought was indelicate in the extreme, but now that the "snug-fitting" has been extended to the ankle, I can only wonder that the ballet-girl style of dress is not adopted outright. It would certainly be most delightfully cool for summer wear, and not much more immodest than the pull-back.

I could say more, but I don't think it expedient.

JACQUELINA.

WHAT A WOMAN CAN DO.

EDS. RURAL:—Noticing your "New Move," I gladly avail myself of the opportunity for a little gossip. "Very like a woman," I think I hear you say. Well, never mind, perhaps some time we shall be better acquainted. Having (for the last ten or twelve years) led a sort of a wandering Gipsy life visiting many different places throughout the country, and, having, for the past two years, spent most of my time at our nation's capital, seeing the wealth and prodigality of to-day, and the wretchedness and poverty of to-morrow, I began to cast about me for some employment that a woman could engage in where she would have an opportunity to gain an honest living without the everlasting torture that hangs over those who drudge out their lives in the "Departments," expecting at any time that they may be sent out into the world destitute.

Remembering my early life, when we had an abundance, which had been drawn from the bosom of mother earth, and feeling that none need go hungry who is willing to till the soil, I decided to turn farmer myself and teach others what a woman could do.

Chance threw me one day in Herndon, a small town about 25 miles from Washington, and here I found a little place, rough, uncultivated and neglected, yet I felt that it was capable of being made into a home such as I had always coveted. I rented it for three months, planted my garden, and did what I could with a limited income to improve it. I was so pleased with it at the end of three months, that I decided to buy it. I found that the same money that would only have paid my board in fashionable society, had paid my rent, my help, planted my garden, bought my cow and chickens, besides many little articles necessary for housekeeping. I do my own housework, save when I have boarders, and then I keep only a little girl. I have a young lad who came out from town to stay a little time, and has been with me nearly five months. He seems contented and happy, and is learning quite a good deal about farming. I call my place "Bonnie Repose," because so many come out from the Departments to rest and enjoy the pure air. Herndon is one of the healthiest towns in Fairfax Co., contains about three hundred inhabitants, three churches, three stores, one school-house, a Lodge of Good Templars, a Grange, a Farmers' Club, and not a whisky saloon in the place. No chills or mosquitoes. The citizens are cordial, intelligent and hospitable, giving a kindly greeting to all who come among them.

I superintend my work both in-doors and out. When I get tired of house-work I go out into the garden and pull weeds, feed and count my chickens or, at this season, transplant strawberries. If perseverance insures success, *I* will *succeed*, for if there is one word in the English language that I detest, it is the word *failure*.

I had new potatoes and green peas two weeks in advance of my neighbors. We need but one thing to make this one of the most, if not the most desirable place in which to locate, and that is a reduction in the railroad fares. Many would come out here and make themselves homes were it not for this. The poor, weary Department clerk, who toils all through the heat of the day, could come and breathe God's pure air. Truly, God made the country, but man made the town.

Hoping that you will deem me worthy of a place among the members of the Club, I am, very truly,

Herndon, Va., Aug. 16, 1878. H. B. N.

WOMAN AS A REFORMATORY ELEMENT IN POLITICS.

GAIL HAMILTON'S peculiar course, of late, has led me to inquire whether she is a fair representative of the "emancipated" woman that is to be?

Those who advocate allowing women the right of suffrage, have always insisted that her advent into the political arena would be the signal for the abolition of bribery, personal abuse and corruption and coarseness of every sort. With this prophesy forever ringing in my ears, it's quite natural that I should be on the alert for straws which should indicate whether or not the political millenium is likely to result from women interesting themselves in public affairs, and as the fair Gail is a straw of uncommon proportions, she could not fail to attract my attention and I've watched her course with considerable interest. And what have I seen? A woman using her pen—so strong in adjectives and in vituperation—to heap scorn and contumely on the foibles and sins of the average politician holding up to honor those who represent morality, and encouraging any efforts made for the bettering of the life political? I saw nothing of the kind. Gail Hamilton who, it must be allowed, is superior to the ordinary run of women—for has not her genius been allowed free development, unhampered by the repressing influences of a husband? has she not written books? and to crown all, is not the honorable (?) gentleman from Maine an acquired relation?—— has employed all the wealth of invective at her command (and there is a whole mine of it,) to vilify and traduce the most honorable of men and of measures, and has glorified as demi-god a political trickster, some of whose practices will not bear the light of investigation.

No demagogue could possibly exceed her in distorting facts, and very few of the most debased of political hacks would so far forget themselves as to make so shameless and unprovoked an attack on a pure, Christian gentleman, as this woman treated Rev James Freeman Clark to, some months since.

If Gail Hamilton's contributions to contemporary political literature, are a fortaste of the "reform" and "milleniumism" which will dawn on us when women have a finger in the political pie, for myself I should prefer to take my politics in their present unregenerate state.

FREE LANCE.

"CLUB" IS TOO "FAST."

DEAR FAITH RIPLEY:—I like your idea of giving the women a chance to put in a word once a month, and I look forward with pleasurable anticipation to reading what the RURAL women will say.

It seems ungracious in my first letter to complain, but to be honest, I don't like the idea of calling this monthly interchange of ideas a "club." It may be an unreasonable prejudice on my part, but I always associate "clubs" with horse racing, betting, wine-drinking and fast men. Couldn't it be called the "Womens' Exchange?" This is only a suggestion, you know, and I'm half afraid now that I've made it.

LILLIAN MARSH.

DID THEY "GIVE THEMSELVES AWAY?"—When it came to tasting mustards at the Paris Exhibition, the jury was composed half of women, on the ground that the palates of the fair sex were not depraved and deadened by tobacco. The propriety of the resort to both sexes was obvious, but why is it denied in so many other relations of life? Is tobacco the only moral and physical stimulant which differentiates the sexes and necessitates the reliance on both to secure accuracy of sensibility? Does n't the mustard decision surrender the whole case for the superiority of man, and his monopoly of the learned professions, the government and even of what are supposed to be the principal agencies of moral progress? Are there no moral narcotics against which it would be profitable to guard, by calling in the aid of sensibilities less exposed and less vitiated and hardened?—[Springfield Republican.

Pattern (No. 6321) which we give in this number, is one of the novelties for fall wear. It is graceful and stylish in effect, and promises to be exceedingly popular. The pattern can be obtained at this office for 25 cents. Full printed directions accompany every pattern.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

SUMMER SIFTINGS.

ANNIE L. JACK.

SEPTEMBER! It is the early autumn seen in every fleeting cloud and in every brilliant flower. The stillness of the trees is felt; the sunbeams have a cooler glow and the glints of light and shadow are "summer siftings" no more. Do we regret it? Ah, me! do we not! Other summers may come and go, but never again will one be *just* the same. Each year we advance or go back, and the same feelings cannot be reproduced.

It is a busy month. The garden is one mass of yellow squashes and ripening corn. Apples, apples everywhere drop from the trees, and the early fruit is marketed. The careful housewife gathers her plums to preserve, cans her peaches, secures her tomatoes in every available form, and prepares for the long and dreary winter. Happy is the woman who has laid by in the early spring some fresh, new garments and stockings for the children; for the frost comes unawares, and colds and many diseases follow. While beautiful, almost, as Juno—except for the wealth of roses—I deem September a treacherous month, delusive, with its soft and balmy air, for delicate people, though bracing for the strong and healthy. The grapes are purpling, the pears turn their russet cheeks to the sunshine, rich treasures of color are found among the flowers, but they lack the freshness of spring, the glow of summer, and we enjoy them with a quiet rapture that is tinged with pain. Summer siftings cannot return this year.

DOMESTIC RECIPES.

Care of Brooms, Recipes.

A friend of my early days used frequently to say, "Show me a housekeeper's broom, and I'll tell you what she is." I am reminded of the force of the saying, when I see the too common misuse of that very necessary article. There are housekeepers who never have any particular place for their brooms, but leave them where they were used last, while others use the same brooms for parlor and kitchen, and when worn out they are thrown into the cellar or back yard to remain indefinitely. Some are in the habit of resting heavily on the broom while stooping to pick up pins, thread, etc., which one finds while sweeping. The result of this is, that the splinters are bent upward and broken and the broom soon becomes worthless. When a new broom is purchased, provide a way for hanging it up in this wise: With a small gimblet bore a hole through the handle about an inch from the top; draw in a piece of strong, waxed twine, long enough when tied in a hard knot, to form a loop three or four inches long. If brooms be dipped in clean, hot suds once every week and dried quickly, they will last twice as long. When too much worn for the house, they will answer for a time at the barn. When too old to sweep with at all, take off the wire for future use; cut the handle into kindling material; pull apart the straws, and add gradually to the fire, and you are rid of a useless article for "good and all."

Pressed Chicken.

I have noticed when traveling on the cars, that many of the passengers who carry their lunch, generally have a liberal supply of chicken. Now, there is no objection to the fowl itself, but there is to the *shape* in which it is often taken. When there are so many good recipes for "pressed" and "jellied chicken," it seems as if the bones, need not be carried. I was once obliged to occupy a seat on the cars with a stranger, who entertained me for a half hour by gnawing the wings and legs of a fowl. At the same time another person who sat directly opposite, was engaged in the like occupation. If chicken be prepared according to the accompanying recipe, travelers need not be aware of the nature of each other's luncheon:

Cut up a young fowl and put it in a kettle, with one coffee-cupful of cold water. Sprinkle with salt and pepper, and cover closely. When tender, pick the meat off the bones, and chop into bits, the size of peas, and pack in a quart bowl. Thicken with flower the little juice that remains in the kettle, and pour over the chicken. Put a plate on it, while warm, and a heavy weight on the plate. It is necessary to cook the fowl, in but little water, otherwise it will not jelly. It is best not to cut pressed chicken until the day after it is made. Place thin layers of it between thin slices of bread, and press firmly together. To be eaten without separating, like sandwiches.

Crab-Apple Jelly, and Marmalade.

Wash the apples in hot water, then put in the preserving kettle, with not quite enough cold water to cover. Cook them slowly until soft, but not broken. Pour off the juice and strain it. To each pint of it, put one pound of granulated sugar, and boil twenty minutes; skim, pour into tumblers, and let it stand in the sun a few days to harden.

For marmalade: Take the same apples from which the jelly was made, add water, in the proportion of one half pint to each quart of apples; cook until very soft, and press through a sieve. To each pound of this pulp, put a half pound of sugar, and cook slowly for an hour, stirring often. Watch constantly, as it burns easily. Put in air-tight glass cans.

MRS. M. G. R.

To Dry Sweet Corn.

Why need housewives spoil their dried corn, by cutting the whole kernel off with one slice, when if they were to cut only the outer part, and scrape the rest, it would be so much more delicious! It should not be cooked longer than fifteen minutes before it is dried. The best method I know of to dry it, is to spread upon plates, and set in the oven, which is kept tolerably hot at first.

Not Scalding Tomatoes:

If one be provided with a sharp knife, and remove the skins from tomatoes without first scalding, they will have a fresh, lively taste, which they never have if scalded. Having so many smooth varieties now, it is not hard to follow the above: AUNT FLORA.

News of the Week.

Monday, Sept. 2, 1878.

POLITICAL.

The Potter Committee has finally concluded to adjourn until the chairman shall see fit to call them together again. Butler will have his hands full for some time in canvassing Massachusetts in his own behalf, having just accepted the nomination for Governor as an independent candidate in response to upwards of 40,000 voters whose signatures are said to have been attached to the petitions requesting him to do so, of which mention was made here last week. He says he will avoid as much as possible national politics and confine himself to State issues. Potter and the other members of the Committee will also find plenty to do in the coming canvass, so that it is not likly that there will be another session until shortly before the reassembling of Congress next December. It was said during the week that the original of the notorious Sherman letter was in possession of the Committee and that they would spring it as a surprise on the public, just before the elections. Ben Butler however, has published a card, denying the truth of this allegation.

Somebody has been overhauling Secretary Sherman's somewhat crooked financial record, and finds that in 1863 he used this language: "The man who would demand the payment of the five-twenty bonds in coin is an extortioner." Ex-Guerrilla Mosby wanted to be assistant attorney-general, but will take the Canton, China, consulate, though he says he shall come back to go into the campaign for Grant in 1880. Minister Stoughton was among his backers, the family having been good friends of Mosby ever since he captured a nephew of the minister's in the war and treated him well. Simon Cameron, of Pa., was another, and a host of prominent republicans also indorsed him. Col. McClure of the Philadelphia Times has been around in Pennsylvania a good deal this summer, and is very much impressed by the strength of the national movement. He reports that it has a great hold upon the farmers in many sections, who find it very hard work to pay their growing interest with the diminishing prices they receive for their produce, and easily embrace the opinion that printing a fresh lot of paper money will bring them relief.

MISCELLANEOUS.

THERE was a very pleasant meeting of gentlemen interested in the breeding of Small Yorkshire Swine, a few days ago (August 21) at Col. Hoe's office in this city. It resulted in the organization of the "American Small Yorkshire Swine-Breeders' Association." The ballot for officers resulted in the election of Richard M. Hoe, President; August Belmont, Jr., Treasurer; and Geo. W. Harris, Secretary, who also constitute the Executive Committee. The initiation or membership fee was fixed at five dollars. The entry fee was fixed at fifty cents a head for animals belonging to members of the club, and one dollar each for animals belonging to non-members. M. C. Weld, R. B. Duyckink and Wm. H. Cole were appointed a committee to prepare a Constitution and By-Laws, to be submitted to the members of the club at the next meeting.

It was resolved that previous to the adoption of the Constitution and By-Laws any applicant for membership may be received as a member on the unanimous recommendation of the Executive Committee. The entries of such an one may be recorded in the Herd Book, also those of persons not members, after the pedigrees of their animals shall be submitted to and approved by the Executive Committee.

The Secretary was directed to furnish entry blanks on application of members and other breeders desirous of having their animals recorded in the Herd Register, and was directed to send to every breeder of Small Yorkshires, to whom notice of meeting was sent, and any others suggested, a notice of the organization of the club and the action of the meeting.

The Association adjourned to meet at the office of R. Hoe & Co., No. 31 Gold Street, New York, at 11 A. M. on Wednesday, the 6th day of November, 1878, for the purpose of receiving the report of the Executive Committee, adopting Constitution and By-Laws, etc.

The late decision of Sec. Schurz, with regard to the pre-emption and entry of railroad lands relates exclusively to railroads that have received money aid from the government or a grant of land so large as to be a substitute for such aid. The unsold lands of the Union Pacific, Central Pacific, Denver Pacific and Sioux City roads are already embraced by this decision, because these roads have been completed three years. The lands of the Northern Pacific road will also be included when the road shall have been three years completed, unless the law on the matter shall be in the meanwhile repealed or this decision shall be reversed by the Supreme Court. There are a number of railroads that received grants of lands from the State legislatures, the same being donated by the general government to encourage local and State improvements, such as the Illinois Central and St. Louis, Iron Mountain and Southern railroad. These are excluded from the scope of the decision. All the lands included by the decision can be entered or pre-empted like any tract of unsettled government land, but the railroad companies have warned all such settlers that they will be summarily ejected, and a case will doubtless, ere long, be made up so that the Supreme Court may finally decide the question. The most important paragraph in Sec. Schurz's decision is as follows.

"By the terms of the grant by which said lands, or the proceeds which shall arise from the sale thereof, inured to said company, it is provided that lands remaining unsold at the expiration of three years from the time when the entire road was completed, shall be subject to settlement and pre-emption like other lands, at a price not exceeding $1.25 per acre; in other words, that said lands shall revert to the public domain for sale and disposal for said company under the pre-emption laws of the United States. And whether it be considered that said lands are public lands in a general or special sense cannot in my opinion affect the jurisdiction of your office (the land-agent's) in making sale and disposal of the same."

Mrs. Myra Clark Gaines gains possession of her New Orleans property, after her two or three centuries of litigation, only to find herself attacked by English claimants to seven-eighths of it, who offer to New Orleans lawyers half of their share to secure their rights. The principals and instructors of the deaf and dumb of the United States and Canada held their ninth annual convention at Columbus, O., last week, nearly 300 delegates attending, most of whom could converse in the sign language. It is a little over 60 years since the establishment of the American Asylum at Hartford, and now nearly every State in the Union has a school for the special instruction of this unfortunate class, while those that are without such a school provide for the education of their deaf-mute children in the schools of other States. During the past year over 6000 children and youths have been under instruction, at a cost of nearly a million and a half dollars. It is estimated that Delaware's peach export for the season will amount to 700,000 baskets, netting the shippers $575,000. They call it a small year for peaches and place the whole yield within 1,000,000 baskets.

Toledo lays claim to having become the great grain center of the country, producers and shippers having discovered that it is a better market for their grain than Chicago and Milwaukee, which have been the great receiving points. Between July 1 and August 20, Toledo's wheat receipts amounted to 3,515,000 bushels, Chicago's to 2,639,000 and Milwaukee's to 1,728,000. Toledo feels sure that she will continue this preeminence through the season, for she received 1,113,214 bushels of wheat last week, 179,914 more than Chicago and Milwaukee both reported. Jay Cooke & Co. have declared another dividend of five per cent.

FOREIGN.

Severe fighting still continues to mark the occupation of Bosnia and Herzegovina by the Austrians. Batoum is being dismantled previous to its surrender to the Russians. The latter are quitting the neighborhood of Constantinople in large numbers on their way home. The Bulgarians are still massacring and outraging the Mahommedans residing among them. All accounts from that region agree that these people are utterly unfit for freedom, cowardly, cruel, utterly unprincipled and a disgrace to humanity. The outrages committed by them since the close of the war, far transcend those perpetrated by the bashi-bazouks before the opening of hostilities. Lately a committee of officials appointed by the Powers that signed the treaty of Berlin, investigated these atrocities and they have officially denounced their enormity and declared that the Russians were culpably? responsible for them. During the week the latter have tried to prevent the Bulgarians from continuing their crimes, and a fight between the two has been the consequence.

There has been a terribly fatal storm near Miskolez, Hungary. The corpses of upwards of 400 victims to its fury have already been found and it is estimated that hundreds have been swept away by floods, whose bodies have not yet been recovered. Bismarck has prepared for the Reichstag a project for a code of laws against socialism, of a most arbitrary nature. If passed, the whole of Germany will be placed under his despotic sway. It is believed, however, that a compromise much milder in its effect, will be forced upon him. Contrary to telegrams last week, it is now announced that an agreement has been arrived at between Berlin and the Vatican. The Falk laws are to be considered a dead letter; all persecution of Roman Catholics to be discontinued, and, in return, the Government will receive the support of the majority of the ultramontanes.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Aug. 31, 1878.

BEANS AND PEAS.—There are now indications that the old stock of beans will go out more steadily than was supposed a week or so ago. A late harvest is admitted by all who have correspondence on the subject, and with a fair trade and no extremely restrictive limits, old crop will show little surplus by Oct. 1st. Many buyers have regarded the intimation of receivers as one of the "crop-scares" so often vented, while others have quietly secured a fair portion of the supply. Marrows show a fair exportation, 1,000 bbls. per week, with general receipts down to 2,000 bush. Mediums firm, with a fair business: other kinds nominal; red kidneys virtually out of market; Canadian peas scarce and something stronger.

We quote Canadian peas at 76@78c.; green peas 77c. @$1 20@1 25; medium beans, prime, $1 55; fair to good, $1 45@1 50; marrows, prime, free on board ship, 1 55; fair to good, $1 40@1 47; Pea, and white kidney, $1 35@1 50; turtle soup, $2 40@2 50.

BUTTER.—The best point and an unexpected one, to note in the butter market this week, is the welcome appearance of exporters. Heavy supplies in summer, with a limited local trade only to handle them, make sellers nervous, and dealers talk as though they have had enough of a conversationally strong market. Sales are the needful emphasis required when receipts are liberal and advices give assurance of plenty to come, and there is a general resolve to keep stock running even if the range has to be made favorable to wholesale buyers. The quality of much of the butter now arriving is not such as might encourage holding; marks that should show a grass tint are faulty in that respect, and buyers point to any natural defect of hot weather made stock, when comparison is made with the low, early rates, at which a large business was done. The fall is close at hand, and reports foretell a large yield. The churnings of autumn of late years has found great favor with the New York trade, and when they have been small the market has derived an upward movement from that fact. When those grades begin to come, there will be a large offering that must be handled by the foreign shipper, and it will better for all parties if he can be allowed to use it as butter instead of grease. The sales of Western butter for export have been mostly at 8@10c.; State and Western creamery, same use, at inside rates. Shippers seem to be anticipating exports of Canadian surplus, and as we have remarked, New York dealers should be permitted to manage the market without hindering suggestions and limits from the interior.

State dairy, pails, choice, 19@20c.; other, 14@18c.; half tubs and pails, choice, 18@19c.; other, 14@17c.; Welsh tubs, choice, 17@18c.; other, 14@16c.; poor State, 10@12c.; creamery, best, 22@23c.; good, 19@20c.; sweet cream, 19@21c.; Western creamery, best, 21@22c.; other, 14@20c.; Western dairy, selected, 18@14c.; fair to good, 10@11c.; factory, best, 10@12c.; fair to good, 8@9c.; very poor, 6½@7c.; grease, 4@5c.

Receipts for the week 29,900 pkgs.; Exports, 16,174 pkgs.

CHEESE.—Supplies have been piling in here again this week, and have accumulated largely in store, since shippers have been very indifferent. The chief demand has been for the choicest, or late made factories, and these have brought steady prices, at 8¼c, and on special lots 8½c. Good grades stand relatively low, and are hard to move.

Quotations are: Fancy at 8½@8¾c.; 7½@8¼c. for good and prime; 6¾@7¼c. for fair; 5½@6c. for half skimmed; 3@4½c. for skimmed. State, farm dairy at 7¼@7¾c. for good to choice, 6@7c. for fair to good, and 3@4½c. for poor skimmed. Wisconsin factory, fine to fancy, 8¼@8½c.; do. good to prime, 7@8c.; do. fair, to good, 6@7c.; Western factory, fine, full cream, cheddar, 7½@8c.; do. fine, full cream, flat, 7½@8c; do. slightly skimmed, flat, 6½@7c.; do. half skimmed, 5@6c.; do. full skimmed, 3@4c.

Receipts for week, 107,260 boxes.
Exports for week, 65,356 boxes.
Gold closes at 100¼.
Liverpool cable quotation, 44s.

COTTON.—There has been a good deal of excitement this week, based upon the close of the month and the short interest developing, and also upon the reports from the South of delayed movement of supplies in certain sections by the sickness prevailing there. Latest prices are for August, 12.03c.; for September, 11.01c.; for October, 11.23@11.30c.; for November, 11.10@11.11c.; for December, 11.04@11.14c.; for January, 11.06@11.07c.; for February, 11.12@11.14c.; for March, 11.18@11.20c.; for April, 11.25@11.27c.; for May, 11.32@11.35c.; June, 11.39@11.40.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	10¾	10¾	10⅞	10⅝
Strict ordinary	10⅞	10⅞	10¾	10⅝
Good ordinary	11⅜	11⅜	11⅜	11⅜
Strict good do	11 11-16	11 11-16	11 15-16	11 15-16
Low middling	11 15-16	11 15-16	12 3-16	12 3-16
Strict low middling	12 1-16	12 1-16	12 5-16	12 5-16
Middling	12 3-16	12 3-16	12 7-16	12 7-16
Good middling	12⅝	12⅝	12⅝	12⅝
Strict good middling	12 11-16	12 11-16	12 15-16	12 15-16
Middling fair	13 3-16	13 3-16	13 7-16	13 7-16
Fair	13 15-16	13 15-16	14 1-16	14 1-16

Stained.

Good ordinary.....10⅝; Strict good ordinary.....11
Low middling.....11⅛; Middling.....11⅜

But the main support to price was given by the reduced stocks on hand and the interruption to the movement of the new crop caused by the yellow fever epidemic in the Mississippi Valley. It was estimated that the receipts of cotton at the ports in August would reach 50,000 bales, but it is now apparent that they will scarcely exceed 30,000 bales. The improvement in the statistical position for last week was not so great as it was the previous week, the deficiency in the visible supply being 624,569 bales as compared with last year.

DRIED FRUITS.—Apples are having a little more attention, the new crop particularly, of which sales of handsome sliced as high as 6c.@7c. Blackberries and pitted cherries are doing better, as also peeled peaches, which have increased demands. New blackberries, are quoted at 5½@6c. Peaches—Peeled, new Georgia, 4@5c. for poor, 6@7c. for good and 7½@8c. for prime, and a choice lot selling at 8½c.; choice North Carolina at 10c., and some lots held higher; unpeeled old halves, 3@3½c.; quarters, 2½@3½c. Pitted cherries, 15c.; southern plums, new, at 9@10c. Apples—State quarters, 3@4c.; do. sliced, prime, 4½c.; do. good, 3½@4c. New apples at 2½@3½c. for southern quarters in bbls.; 1½@3½c. for prime sliced, and 6@7c. for fancy. New raspberries, 22c., and evaporated, 24@25c.

Exports past week 107 bbls. apples; since Jan. 1st 10,801 do.; this week, 1577, 23,400 do.

EGGS.—Receipts for week 6,162 bbls.; do. last week 5,135 do. Prices for western have been up to 18c., but the additional receipts proved enough to break the price, and 17c, is now extreme for fresh Western or Canadian, fair qualities 16@16½c. Near points, 18@18½c. State and Penn., 17@17½c.

FLOUR.—Supplies have been liberal, and although wheat has tended higher, prices have yielded a little more, especially for other than regular shipping extras.

Latest prices are $3.40@4.00 for very inferior to fancy superfine State, the latter an extreme; $4.00@4.20 for poor to good extra do. and lots and lines; $4.20@4.50 for good to very choice do.; $3.35@4.00 for very poor to fancy superfine Indiana, Iowa, Michigan, Ohio, &c., $3.90@4.20 for inferior to good shipping extra do. and $4.20@4.50 for good to very fancy extra do.; common to about choice white wheat extras, $4.50@5.40; choice to very fancy do. at $5.50@6.50; red and amber winter wheat, inferior to very choice trade and family at $4.10@5.60; round hoop Ohio at $4.00@$4.30, and trade and family brands of do. at $4.35@5.65, the latter rate for choice, (very choice to fancy lots quoted higher); St. Louis, $4.25@5.00 for very poor to good extra, and $5.00@6.25 for good to very fancy; Minnesota clear, very inferior to very choice at $4.10@5.00 (fancy brands at higher prices); Minnesota "straight," very inferior to very fancy, at $5.25@7.25, and patent poor to strictly fancy at $5.40@5.85; unsound stock at from $2.00@5.00; city mill extra at $5.10@5.20 for West Indies (the latter rate for fancy in new packages); do. for England, 4.05@4.10; do. trade and family extras, $5.50@6.10; do. for South America, $5.40@6.00 for fair to fancy; No. 2 $2.50@3.25 for inferior to very fancy.

CORN MEAL.—Is selling at $2.40@2.75 for yellow Western, and $2.90@2.95 for Brandywine.

FRESH FRUITS.—Apples are in fine variety and easy rates keep them fairly active. Porters and Orange pippins $1.25@1.50; Golden Sweet, ripe, $1; in good keeping condition, $1.50; Maidens Blush and twenty oz., $1.50@1.75; fancy, $2@2.50. Bartlett Pears, are not showing as fine as in some former seasons; N. J. stock turns out dark, and up river have to be selected to bring the extremes. Peaches have had a variable market. Some fancy yellow from the Cochran orchards, Del., have sold high; one lot of 25 straight baskets brought $100! Both

Southern and N. J. fruit is turning out poor and the good rates obtained for early morning trade are damaged by the irregular rates of the later part of the day. Delaware crates, extra, $2; common to prime, $1@1 75; choice baskets, $1 75@2; common to fair, 75c.@$1 25; N. J., good to extra baskets, $1 50@2, other, 50c.@$1 25. Plums are bringing stiff prices, helped by scarce and high peaches. Quackenbos, bbls., $8@10; egg, $6 50@8; blue and green gages, $5@7; common, $3@5. Grapes are not attractive and sales are generally at 5@6c., Concords and Hartfords. A few whortleberries remain quoted $1@2 per bush. Watermelons are lower, Virginia has a short crop, fancy per 100, $30; good, $15@18; fair, $8@12; cull, $5@7. With reports of a large crop to come, holders are anxious to sell, but trade is very quiet; Va. hand-picked, $1 45@1 50 bush; other, $1 25@1 35. Hot-house grapes, muscat and Black Hamburg, 40@50c. lb.; Sweet Water, 15@30c,

GRAIN.—Foreign markets have advanced for wheat, export and speculative demands have been brisk here, and prices are higher and closed strong. Corn shows but little improvement. Oats are active and firm in price.

Latest sales of wheat are of No. 1 white, near by delivery, $1 19@$1 20; do., deliveries in September, at $1 20@$1 21, closing with $1 21 bid; do., steamer grade, part to arrive, at $1 15@1 16½; No. 2 white, in lots, at $1 11@1 12; extra white at $1 20@1 21; do, early September delivery, at $1 21 bid; white State, near-by deliveries, at $1 20; do., steamer grade, at $1 16@$1 17; ungraded white at $1 07@$1 21; No. 1 red and amber Michigan at $1 12@1 13; do., early September deliveries, at $1 12½@$1 13; No. 2 red, early deliveries at $1 13½@1 11½, do., August option, part in settlement, at $1 09½@$1 11; do., September option at $1 11; do., October option, $1 11½@1 12; steamer grade, spot, at $1 07@1 08; No. 3 red, in lots, at $1 05½@1 06½, ungraded red, in lots at 90c.@$1 12; No. 2 amber, in lots at $1 10@1 10½; do., August option, at $1 10@1 10½; do., first half September, at $1 10½, do., September option, at $1 09@1 09½; do., steamer grade, spot, at $1 06½@1 07½; ungraded amber at $1 04@1 12; No. 2 Milwaukee spring, reported at $1 15@; new No. 2 spring, to arrive, at $1 05@1 06½; New York No. 2 spring, September option, at $1 06@1 06½; do., deliverable September 1 to 20, at $1 07; do. October option, at $1 06; No. 2 Northwest spring, September option, at $1 08. Rye at 62 for western, and 60@62 for State corn, at for ungraded mixed at 45@50c.; steamer mixed at 48½@49c.; New York No. 2 at 49½@50c.; No. 1 white at 56c.; New York No. 2 August option, at 49½c.; do., September option, 50c.; do., October option, at 52c.; steamer mixed, August option, at 49c.; do., September option, at 49½c; do., October option, at 51½c. Oats are for New York No. 1 at 33c.; New York No. 2 at 30½@31c.; New York No. 3 at 26c.; New York rejected at 25c.; No. 1 white at 38½c.; No. 2 white at 30@30½c.; No. 3 white at 27@27½c.; white western at 28@33c.; mixed western at 24½@33c.; white State at 30@30½c.; mixed State at 29@33c.; New York extra at 33½@34c.; No. 2 Chicago quoted at 32½@33c.

HAY AND STRAW.—Supplies of new crop continue liberal, and prices are easy on other than prime stock. Sales at 45@50c. for shipping and 60@75c. for retail qualities. Straw quoted at 35@45c. for long rye; 30@35c. for short rye.

Exports of hay past week, 87 bales; since June 1st, 42,100 bales; same time, 1877, 32,825 bales.

HOPS—Has been very slow, pending the new crop. Emmet Wells says in his weekly circular:

"The season now closing has been anything but a satisfactory one in point of profit, particularly to the producer; few, if any, have realized prices for their hops sufficiently remunerative to pay the first cost of production. The low prices which have ruled are, however, only the result of an over production, and while the laws of trade continue to be governed by supply and demand, hops will be no exception to the rule. Our crop reports at the present writing continue favorable for a yield of one-half to two-thirds of last year's yield. The reports from England are for a full average yield, and of a good quality. From Germany the crop will be larger than was estimated earlier in the season. Although not growing quite as many as last year, they will have a surplus to spare for export."

Exports from this port for the year ending September 1, 1869, and the following eight years:

	Bales.		Bales.
1869	69,463	1874	1,638
1870	56,453	1875	15,995
1871	24,577	1876	46,116
1872	6,095	1877	44,493
1873	9,315		

Quotations are for New Yorks, good to prime, 10@12c.; do., low to fair, 7@9c.; Eastern, 7@10c.; Wisconsin, 7@10c.; Yearlings, 2@8c.; Olds, all growths, 1@2c.; Pacific Coast hops, 10@12c.

LEATHER.—Sales at 19½@20c. for light hemlock; 19½@21½c. for middle do.; 20@21c. for heavy do., and 17½@19c. for good damaged.

POULTRY AND GAME.—Live poultry rules low; still prices for fowls are satisfactory for the season. Spring chickens are decidedly lower.

Chickens, N. J. 13c. lb.; State and Penn., 12@13c.; Southern and Western, 10@12c. Fowls—N. J. 11@12c; State and Penn., 11c. S. & W., 10@10½c. Roosters, 5@6c. Turkeys, choice, 12@13c.; other, 10@11c. Ducks range at 40@50c pair, the highest price for spring. Geese, extra, $1 50@2; other, $1@1 25.

Dressed Poultry has arrived freely, and most sales may be quoted at inside figures. Turkeys, dry picked 15@16c; good N. J., 14@16c.; fair 13c; Pa. chickens, dry picked, 16@17c.; N. J., 14@15; State and Western, 12@14c.; Phila. fowls, 13@14c.; N. J., 12@13c.; irregular parcels of State and Western range at 9@12c.

Grouse and partridges will be in market this coming week; expected to open at 75c. Woodcock, Western, 70@75c. State, 75@85c. A few stall fed pigeons have brought $1 50. Snipe do not seem to be in quotable quantities.

PROVISIONS have been tending lower, with a slack trade. Mess pork quoted $10 00; $10 35 as to brand for spot lots. $9 80@9 85 for September; $9 90@9 95 for October. Bacon at 6½c. for long clear Lard—western steam in tierce at $7 25 for spot lots; and $7 30@7 32½ September and October deliveries. Stearine at 8@8¼. for choice western. Tallow at 7 for prime. Beef hams at $20@21. Beef—extra mess, $11 25@11 50; plain mess, $10@11; packet, $11 25@12 for bbls.; extra India mess, and Philadelphia, $17 75@$18.

SEEDS.—New crop of flax seed is selling at $1 47½, and timothy to arrive at $1 40.

TOBACCO.—Export demand has been very good, and desirable lots have sold at steady prices.

VEGETABLES.—Exports of potatoes, past week 13,780 bbls; a heavy quantity for the season, and has tended to keep prices steady. Green stuff has a fair sale. E. R. potatoes including Eastern, $1.62@1.87 in bulk per bu.; common, $1.37@1.50, Peerless, $1.25@$1.50; State, double heads, have run to poor for the market. Sweet potatoes, Va., $1.75@1.87; schooner or steamer, Md., $2@2.25. Green corn, per 100, 50@75c. Cabbages, flat Dutch, $2 50@3 50; Lima beans, bag, 75c.@$1; string beans, 50c.@1; cucumbers, per M., $3@4; do., pickling $1@1.50; tomatoes, early vine, 15c.@3 peck crate; late, do., 25c. Onions, white, $1@1.50; red and yellow, $1@1.25. Marrow Squash, $1 50@1.75; Egg Plants, 100, $2@3.50; R. turnips, $1.75@2. Peppers, Bullnose, bbl., $1@1.50; Beets, N. J., $1@1.25; Carrots, $1@1.25; Pumpkins, 100, $7@8; Lettuce, bbl, 50@75c.

WOOL.—Manufacturers have been buying sparingly. Medium fleeces, combing and delaine stock have had most attention, and they rule steady in price; otherwise the market is rather easy.

LIVE STOCK MARKETS.

Saturday, Aug. 31, 1878.

BEEVES.—Receipts for the week, 10,869 head; do., last week, 9,101 do. The market has been overstocked, especially with low quality of cattle. The demand has run upon ship, prime steers, but buyers insisted upon a shade off. Natives quoted 8@10c.; the latter for weighty Kentucky, to dress 55@57c. lbs. Texas and Cherokee 7@8¾c., to dress 55c. lbs.

In discussing some of the features of the recent settlement of live stock freight differences by the Grand Trunk and the Vanderbilt railroads, the Portland (Me.) Advertiser, says:

"It is well known that for over a year it has been a pet project of Mr. Vanderbilt's to see a first-class line of freight steamers running between some port in this country and England. The transportation of live cattle is a business still undeveloped. It will be remembered that a plan was talked of some time ago to make Portland a great cattle station, whence shipments could be made to England. Arrangements have already been made with the Ogdensburg by Mr. Vanderbilt, and arrangements are to be made with the Grand Trunk to carry all the freigh of this class furnished. Then, with the great advantage of a non-freezing harbor at Portland, accommodating steamers all the year round, and with excellent wharf facilities, free from port and wharf charges. Mr. Vanderbilt can put on a line of four to six large freight steamers of not less than 4,500 tons each. These steamers would have first-class accommodations for at least sixty cabin passengers, and would be fitted expressly to carry live cattle, with room, of course, for other kinds of freight. They would be fed by the two railroads."

COWS AND CALVES.—Our last report covered all that can be said this week.

VEAL CALVES.—Market firm for prime live. Buttermilk and grassers 3@3½c.; old, 5@7 for useful to choice.

SHEEP AND LAMBS.—Receipts for the week, 26,685 head; do. last week, 20,078 do. Sheep have sold out well, the closing prices are 4@5c. Lambs range 5@6c.

SWINE.—Receipts for the week, 22,533 head; do. last week, 22,999. State quoted $4 40@4 50 per 100, corn fed; Ohio 4½@4¾c.; N. J. dressed pigs, in a small way, bring 6½@7c.

CLARK'S PATENT

ROOT CUTTER

The above CUT is represented as broken in the frame for the purpose of showing the cutting apparatus.

This cutter is built with a heavy Oak Frame, well bolted together, is staunch and strong, neatly finished, handsomely striped and ornamented. The cutting apparatus consists of **Twenty-Five Steel Knives,** (gouge-shaped) so arranged on a wrought iron shaft that they are perfectly secure; no chance of becoming loose or breaking. The roots are neatly cut in pieces suitable for feeding. No coarse, ungainly pieces are left by this cutter. A boy can easily cut 35 to 40 bushels per hour so easily does it do its work. ☞ Don't fail to examine it.

Retail Price, - - $12.00.

WELLS, RICHARDSON & CO., Prop'rs, Burlington, Vt.

Reading for the Young.

THE BABY FOR ME.

I HAVE heard about babies angelic,
With a heavenly look in their eyes,
And hair like the sunbeams of morning
When first they appear in the skies,
And smiles like the smiles of a cherub,
And mouth like the buds of a rose,
And themselves like the lilies and daisies
And every sweet flower that grows.

My baby's the jolliest baby
That any one ever did see;
There's nothing angelic about him
But he's just the right baby for me!
His smile's not at all like a cherub's
But rather a comical grin;
And his hair—well, it favors the sunbeams,
When sunbeams are wondrously thin.

His eyes, though they're blue like the heaven,
Are remarkably earthly with fun;
And his mouth's rather large for a rosebud,
Unless 'twere a half opened one.
His hands, don't resemble a fairy's.
In the least. They're a strong little pair,
As you'd think, I am sure, if he'd got you,
As oft he gets me—by the hair!

And he isn't a bit like a lily;
Or any sweet blossom that grows,
For no flower on earth, I am certain,
Has a dear little cunning pug nose.
He's himself—full of mischief, the darling,
And as naughty as naughty can be;
And I'm glad that he isn't angelic,
For he's just the right baby for me.

"POCKET-MONEY FOR THE YOUNG PEOPLE."—No. 16.

HECTOR BERTRAM.

IT is really essential that the young people, boys and girls, should have a little money they may call their own, to use in any manner that suits them best. And the apparent value of the amount is, to them, greatly increased by the knowledge that it is their own earnings, the result of the labor of their own little hands. The children of farmers possess much better facilities for obtaining a generous supply of pocket-money than are enjoyed by their city cousins. The different varieties of small fruits and vegetables from which large returns may be realized are really astonishing.

Some one suggests the use of tools for the boys; and to the boys I wish to talk a little, leaving the bright-eyed little lassies to the wise counsels and healthful advice of Mrs. Jack and others. Now, boys, if we contemplate constructing numbers of useful and ornamental trinkets for our mothers, sisters, and neighbors, how much nicer it would be to be possessed of a chest of tools of our own, and not be obliged to use father's heavier ones. By a little judicious saving, these can be easily obtained; and when obtained, let us get some one capable of instructing us in their care. Fine work is done much easier and quicker by the use of bright, sharp tools, than of dull and rusty ones; and the lesson of care learned now will not be forgotten when we are older, and have a larger assortment. But here we are, running ahead of our subject, giving advice about the care of something we do not possess. How shall we obtain them? Here is one way:

Every farmer's boy has, or *should* have, a plot of ground on which to raise such vegetables as his fancy may select. If you do not have such a piece, ask your father for a small section of fertile land, and lay your plans according to its size, taking care not to neglect work he has assigned you. You will have plenty of time for your own, after his tasks are finished. And here a word in regard to neatness. What we do, let us do well; in a manner which will reflect credit upon ourselves. Let us cultivate just what we can do thoroughly, no more. Always remember that one acre well worked is preferable to three hurried over. There is a vast amount of truth in the saying, "The boy is father of the man," and in this case as well as any, what the boy's garden is, the man's farm will be.

Next Fall—it is too late now to secure a crop this season—after your ground is selected, draw out and scatter over it all the barn-yard manure that your father or elder brother can turn under with the plow. The first of next May, or earlier if the weather will admit, give it another heavy dressing of manure, as fine as possible—the scoopings of the yard are best—and cross-plow lightly. After harrowing thoroughly, work both ways with the corn-marker, having the center tooth removed. This will give you rows seven feet apart, provided the marker is made to mark corn three and a half feet, as it should be. At the angles of the rows, drop a hoe-ful of fine manure—from the piggery, if possible—and cover two or three inches deep with earth. Then plant—what do you suppose, boys?—Hubbard Squash! Drop six or seven seeds in a hill, for they may not all sprout, and cover two inches deep. After they are up nicely, run through them with the cultivator to keep the weeds down, and thin to three plants in a hill. A good coating of plaster, and a sprinkling occasionaly of water, in which saltpeter has been dissolved, will assist in keeping off the bugs—for of all vines, bugs love Hubbard squashes the best. Keep the ground mellow, and perfectly free from weeds. Do not hill them too much. After the young squashes are set, pinch off the ends of the vines, and remove all inferior specimens. Boys, if you never raised squashes, you will be surprised at the result. When they are ready for market, pay a visit to your nearest village, and contract all you can, carrying a book along, and taking down the names of your customers, and the number each desires.

They sell rapidly here—Southern New York—at from ten to forty cents a piece, according to size and quality. Now for the profits. On an acre planting this distance, we would get about eight hundred and fifty hills. At a low estimate, we should raise three marketable squashes to the hill, or two thousand, five hundred and fifty in all. Calculated at ten cents a piece, the lowest price, we have as a result of our labor, two hundred and fifty-five dollars. I do not expect many of the boys to plant that amount of ground, but it shows the average profit. Now, boys, who will raise the largest crop of squashes another summer? Make a careful note of time of planting, amount of labor employed, and the net profit with amount of ground, and send it to the RURAL.

THE TAILOR-BIRD.

THE engraving of the Tailor-bird and its Nest pictures a peculiar style of architecture that excites admiration for the ingenuity of the little bird that can make its own thread, and selecting a pair of broad leaves, sew them together, thus manufacturing a safe, pleasant, "leafy bower."

The nidification of birds is not the least interesting subject for observation, and our young cousins might spend many a pleasant, profitable hour in studying the characteristics of the bird architecture in their neighborhood. I will venture to say that in predatory excursions whose object is the depletion of these same nests, it never occurs to the merry young robbers to pause a moment to observe the structure, beauty and adaptability of means to an end that are displayed in the building of the nests. In future let me ask you to do so. It would be pleasant to see this subject made a theme for your letters.

Many birds, like many people, take no very great pride in having a fine house. In fact, some think it quite as convenient to have no house at all. The Cuckoos of the Old World and the Cowbirds of the New merely keep a sharp look-out for some agreeable nest belonging to another bird, and when the family is not at home, quietly enter, take possession, and leave their card in the shape of an egg. The foolish owners remain oblivious to the visit until the foster-child is hatched, when he successfully counterfeits the real heirs, and causes his foster-brothers and sisters to fall victims to his canabalistic appetite. The Auk tribe have no particular fancy for building nests, either, but, on the other hand, they work no evil to their species. The female places its single egg on a bare ledge of rock, where it is in great danger of being rolled into the sea by the wind, on account of its peculiar conical shape. The Stone-Curlew, also, deposits its egg without the least preparation of the soil on which it rests; yet it is not done haphazard, as no birds are more constant in selecting, almost to an inch, the same spot year after year. In marked contrast to these Bohemian habits is the care bestowed upon its nest by our Tailor-bird, the Bottle-titmouse, or the Fantail-Warbler.

The Ostriches, females, are great women's-rights birds. They think it well for Darby to play Joan occasionally, hence, after scraping a hole in the sand, and depositing the eggs, they stroll over the sands of the desert, and leave the male to attend to the cares of incubation. But he thinks it incumbent on him to remain on duty only during the night, leaving the heat of the sun to complete his task during the day. The Megapodes, however, improve on the little device of the male ostrich. They raise a hot-bed of dead leaves, wherein they deposit their eggs, and the young are hatched without further care on the part of either parent. Agents for patent incubators could never make their salt in such an intelligent bird community, and an artificial mother, by a strange antithisis, is quite the most natural in select megapodesian society!

Very many birds bore holes in some sandy cliff, and at the end of their tunnel deposit their eggs, with or without bedding. Such bedding, too, is various in character; thus, while the Shadduck and the Sand-Martin supply the softest materials, the one of down from her own body, the other of feathers collected by diligent search, the Kingfisher uses undigested spiny fish-bones, which she ejects in pellets from her own stomach.

The edible bird's-nest confection, of which the Chinese are very fond, is made by the Swifts, from a secretion of the salivary glands,—a fluid which rapidly hardens, as it dries on exposure to the air, into a substance resembling isinglass.

Certain Warblers, for unknown reasons, invariably supply a piece of snake's slough as an indespensible adjunct to the household furniture. It has been suggested that this is done to repel lizards on marauding thoughts intent, who, seeing the slough, may have reason to suppose it is in reality their deadly enemy, and consequently beat a hasty retreat.

The most comical bird is the Flamingo. She erects, in marshes, a mound of earth some two feet in hight, with a cavity a-top, on which, having oviposited, she calmly sits with legs dangling, and in that remarkable backwoods-tavern attitude, is said to perform the duty of incubation. She only needs a pipe and the morning paper to make the picture harmonious and complete. I might consume space indefinitely telling you of the funny, and interesting habits of birds, but for the present I shall maintain the reserve of a

REFORMED NEST-ROBBER.

WHAT IS TO BE DONE?

FEW people, old or young, have any knowledge of what to do in emergencies, especially in cases of accidents. Such knowledge, however, is of the first importance, and not seldom instrumental in saving life. Now, I shall propose a series of questions, and wish my nieces and nephews to tell me what would be the best thing to do before the arrival of the doctor:

1. Child of two years old has an attack of croup at night. Doctor at a distance. What is to be done?

2. Hired girl sprains her ankle violently.

3. Bees swarm; and the man who hives them gets severely stung in the face.

4. Some one's nose bleeds, and cannot best opped.

5. Child eats a piece of bread on which arsenic has been placed for killing rats.

6. Young lady sits in a draught, and comes home with bad sore throat.

7. Nurse suffers from a whitlow on her finger.

8. Child falls backwards against a tub of boiling water and is much scalded.

9. Mower cuts driver's leg as he is thrown from seat.

10. Child has bad ear-ache.

11. Youth goes out to skate; falls through the ice; brought home insensible.

12. Child gets sand in his eye. UNCLE TRUE.

The Puzzler.

MISCELLANEOUS ENIGMA.

I AM composed of 91 letters:
My 40, 12, 38, 7, 6, 74, 14, 28, 16, 22, 36, 9 of a mixed-up nature.
My 13, 49, 18, 44, 2, 55, 27, 28, 10, 58, 73, 31, 3 vindication.
My 88, 29, 50, 33, 34, 42, 17, 84, 82, 9, 86, 64, 39 commander-in-chief.
My 2, 81, 62, 41, 11, 25, 26, 46, 68, 56, 87, 2, 63, 60 explanation.
My 52, 37, 59, 19, 79, 57, 90, 38, 76 finished with care.
My 44, 21, 30, 45, 48, 73, 4, 65, 43 relating to typhoid.
My 83, 6, 89, 21, 54, 20, 24, 85, 48, 3 a body with many sides.
My 8, 11, 63, 88, 69, 70, 53, 10 a town of Ireland.
My 15, 22, 6, 61, 26, 75, 79, 28, 66 an animal.
My 5, 27, 28, 1, 55, 51 means sinful.
My 32, 67, 77, 78, 73, 60, 74 a nuptial festival.
My 47, 72, 12, 91 a garden nuisance.
My whole is a proverb of Scott Downey.
☞ Answer in two weeks. LITTLE ONE.

GEOGRAPHICAL ENIGMA.

I AM composed of 20 letters:
My 10, 17, 1, 7, is a river of Asia.
My 17, 15, 4, 9, 12 is a city of Ohio.
My 2, 12, 4, 15, 18, 9 is a lake of N. A.
My 11, 4, 18, 16, 18, 7, 12 is a peninsula of Europe.
My 9, 3, 18, 12, 2, 6, 9 is a river of S. A.
My 4, 2, 14, 9, 12, 4, 2 is a city of Canada.
My 7, 3, 4, 18, 6 is an ocean.
My 12, 2, 14, 4, 20 is a sea on the coast of Europe.
My 15, 4, 2 13, 16, 18, 7 is a town of Ohio.
My 4, 13, 4, 2, 15 is a mountain of Europe.
My 13, 8, 18, 6, 15 is a bay of S. A.
My 5, 20, 18, 10 18, is a country of S. A.
My 6, 13, 3, 8, 2, 16, 10 is a county of Illinois.
My 12, 18, 10, 17 is a river of Africa.
My whole is a State and its capitol.

FAITH.

RICHARD MC'CARTNEY.

FAITH in Jehovah's Lord.
In Christ—The Perfect Man!
Faith that his holy word
Reveals redemption's plan.
Faith in his body broken,
Faith in his life's blood shed,
Remember'd in the token
Of wine and broken bread.
Faith in The Searching Grace,
Who shows to me my sin,
Who re-creates a place
Where Christ may dwell within.
Faith in Abiding Love
Who will not let me stray;
Faith in a home above,
In bright eternal day.
Faith in a searching hour
That will all thoughts reveal;
Faith in a Judging Power
Whose word is woe or weal.
Faith in Creative Power
Unbounded by behest.
Eternal working hour
The true eternal rest!
Faith that tho' worms devour
My flesh—yet I shall stand,
By the Redeemer's power,
In flesh at his right hand.
Faith in The Coming King,
Who all the earth shall own—
While all earth's nations bring
Their tribute to his throne!
Faith that all power shall own
The Christ—and 'fore him fall,
Then he'll give up the throne
And God be all in all!

[*Chicago Standard.*

NEWNESS OF LIFE.

"We also should walk in newness of life."—Rom. vi.

THE newness here spoken of is a newness of notions, dispositions, desires, and conversation, which, when heavenly or godly, are deservedly styled new; because corrective of, and contrary to, those impure and worldly ones, to which we, as sinners, are all liable.

Let us see, then, how we *may walk in newness of life*. In St. Paul's Epistle to Titus, the second chapter and twelfth verse, we have given the three great duties which the Gospel requires of us, viz.: Sobriety, Righteousness, and Godliness. In this verse we are taught that the summary of Gospel doctrines is to oblige us Christians to renounce and forsake all impious practices, and to perform all sorts of duties reducible to three heads, viz.: towards ourselves, towards our brethren, and towards our God.

We should, therefore, if we wish to walk in newness of life, be—and Christianity would have all men so—1. Sober; 2. Righteous; and, 3. Godly, or Pious.

Let us consider each of these great duties in the order I have given them.

1. SOBRIETY is, as I have just said, a duty we all owe to ourselves. It consists in the regulation of our appetites, passions and desires. To be sober is to keep our bodies properly under self-control; to be temperate and pure in thought, word and deed. St. Paul says he that is impure sinneth against his own body, which is a temple of the Holy Ghost; and if any man destroy the temple of God, him shall God destroy.

2. RIGHTEOUSNESS comprehends in its two principal branches—Justice and Charity—truthfulness, sincerity, patience, forgiveness, gratitude and liberality. Both present and future rewards are promised by our Lord to those "which do hunger and thirst after righteousness," and, in the same Sermon on the Mount, He pronounced an awful sentence upon those who merely put on the outward garb of religion.

3. GODLINESS shows itself in love and faith, gratitude, pious fear and humility. It is, in one word, being like to God. The godly are assured by our Saviour that piety and virtue have a tendency to promote our temporal welfare and the Scriptures record many promises of eternal life. We have a beautiful example of godliness in the pious Enoch, who, we read, "walked with God;" that is, he was sincerely religious, and eminent for his attainments in holiness. It was the advice of a heathen, as the strongest inducement to virtue, always to imagine some good man present. But to be constantly mindful that God's eye is upon us, must surely make a deeper impression on our hearts, disperse all bad thoughts, and overcome all evil imaginations. We are defective here; and, in consequence, temptations easily overcome us.

Having now considered the ways and means to be able to walk in newness of life, both in this world, and the one hereafter, I will now try to apply the text. Let every reader ask himself the question: Am I studying to please God? Ah! dare I to affirm it; if inclination alone directs, are you not walking after the flesh? Some are forward to plead in their own excuse, "We would do otherwise but company seduces." What is this, but an acknowledgment that they walk according to the course of this world? We must then throw off all worldliness, that we may not walk in the oldness of life. In conclusion, let me beg of you to think of the gracious promises bestowed by God on all those who walk in newness of life. Good-will follow.

W. S. (Aged 17).

HAPPINESS lies not in those things that a man may enjoy, and yet be miserable for ever. True happiness is too big and too glorious a thing to be found in any thing below that God who is a Christian's chief good.

CHRIST has lost none of his affection to poor sinners by going to heaven.

PERSONAL ITEMS.

Hendricks is fifty-eight; Thurman is sixty-six.

Postmaster-General Key is the father of thirteen little Keys.

Miss Braddon acknowledges the authorship of thirty-three novels.

Queen Victoria is very fond of fine old port, and is said to take a pint of it daily—medicinally, of course.

Isaac Brown, an octogenarian of Jefferson county, Ala., has plowed the same field for sixty-two successive years.

Lord Beaconsfield is renewing his youth and becoming quite gay again. He is a regular attendant at the theatres and evening entertainments in London.

Johnny Steel (Coal Oil Johnny), who more than a dozen years ago insanely squandered the millions got for his adopted parents' oil lands, is now clerking in a grocery store in Dennison, Iowa. He is now but thirty years old.

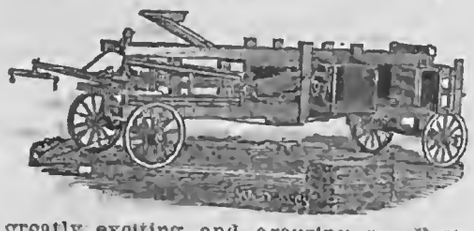
William Gilmore, of Poland, Pa., eighty-five years old, paid $10,000 cash and deeded a homestead worth $25,000 to secure Miss Lendale, his bride of twenty-four summers. Does wisdom go with gray hairs or a bald pat ?

Cardinal Nina, the new Pontifical Secretary of State, is sixty-six years old. From his earliest years he showed decided ability. He is tall in figure, of handsome presence and of somewhat florid complexion. In manner he is courteous and unaffected, mild in disposition, and frank in speech.

Victor Hugo has been working too hard, and has been obliged to retire for rest to his home in Guernsey. He has an unreasonable habit of working upon four or five subjects at once, rarely knowing which he shall finish first. In the morning he begins with whatever subject first takes his fancy, and after devoting himself for a few hours to verses, turns to his novel after luncheon, and finishes the day by writing on some theme utterly unlike that which he took up in the morning. He has now in preparation six prose works and four poems.

Implements and Machinery.

THE ECONOMY



Is greatly exciting and arousing my Eastern Friend, and so much so as to make a great speech, lately published in some Agricultural Papers, saying that nobody should buy the Economy *(rather an old tune)*, claiming it is infringing on his Press, is damaging the reputation of his (Perpetual) and the entire hay interest of the country, &c., &c., and by the way I see, is appealing to the public for a consideration, claiming to be entitled to it from the public—*rather a question to decide.* Right here I will ask you: is my friend entitled to such a claim because he is trying to force a Press upon you, for which he wants you to pay him from $500 to $900, and after you have it, requires the strength of a neighborhood to run it? No, not as long as you can get a Press doing just as good work with two men, one boy and one horse, for $285.00. The Economy is originated and patented by me in all of its parts and principles, of which I have copies on hand and will send them to anybody applying for them. Patented Sept. 25, 1877, No. 195,592 and Jan. 22, 1878, No. 199,360. Its power is far ahead of anything of the kind in existence. The bales are pressed into the baling chamber against the solid end of the Press and between the two doors, which are both opened for the purpose of tying and to discharge the bales, which can be done at either side—*No Perpetual part about it.*

My friend Dederick is telling you something which he don't believe himself. He has been trying to scare everybody for over a year not to use nor to buy the Economy. I have written to him February last, should he not stop such interference that I would come out and have him rectified through the papers, and in reply to the letter of Feb. 27, 1878, he says:

"MR. GEO. ERTEL, QUINCY, ILL.—Sir: Yours is at hand. I understand you have built some of the Perpetual or Continuous Presses, but I notice you have made some changes. Shall be West soon and will see you; also, any statement you will make through the Press will only call for a reply. I advise that you first see me and learn what kind of a man I am. Yours,

P. K. DEDERICK."

I have not, since the above was written, heard direct from my friend Dederick, neither have I seen him, but he still sends out his slanderous threats, and warning everybody handling or using the Economy that he would sue them. He still goes further than that, and has written last June to one of my western patrons, Mr. H. B. Clawson, of Salt Lake City, (who is getting the Economy by car load lots), that he (Dederick) would make him (Clawson) trouble for selling the Economy Press, and states in same letter to Clawson, that he (Dederick) has made a compromise with several parties at $350.00 for every Economy Press sold by them. Now, this I say, is utterly false and unfounded. Did not think that a man of any fairness could stoop as low as that. Will my friend Dederick please give the names of the several parties with whom he claims to have made a compromise for selling the Economy? Mr. P. K. D. surely knows that he has to come to me, and that I am the proper person to whom to make such claims that he may have or bring, if any, against the so-called Ertel Economy Hay Press; I think my friend Dederick may be well informed by the several eaves-droppers, being vouchers of the fact that I am perfectly responsible to defend the Economy, which will and shall be done by me, and I will earnestly request all parties who now or in the future may use or handle the *Economy Hay Press*, that no one of such shall be troubled nor molested, and that I will be strictly responsible for all claims and damages, should any of such caused to be made by any one against the *Economy Hay Press*, which is still alive, and is expected to meet with the Perpetual at several prominent Fairs, and, of course, the choicest Press will sell the best.

Respectfully, GEO. ERTEL.

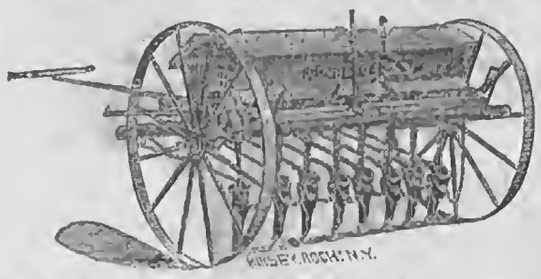
Quincy, Ill., August, 1878.

Implements and Machinery.

FACTS FOR FARMERS.



1st.—The Centennial Commission MADE BUT FIVE AWARDS to Grain Drills and Fertilizer Attachments.

2d.—Of those five, TWO were given Bickford & Huffman. One on the FARMER'S FAVORITE and one on Fertilizer Attachment.

3d.—NO OTHER MANUFACTURERS RECEIVED AN AWARD ON A FERTILIZER ATTACHMENT!

4th.—The award to the "Champion," built by Johnson, Gere and Truman, was "for a machine with attachable manure distributer;" an implement they did *not* exhibit and *do not offer for sale*, as their "manure distributer" is neither "attachable" nor detachable. The report does *not* commend this drill or its "manure distributer," for a single quality of work.

5th.—The award to the Farmer's Friend pronounces it defective by saying *it is capable of further improvement, as regards delivery up and down hill*; and also to the McSherry drill in these words: "*Some further adjustment appears desirable to enable this drill to deliver with equal equality up and down hill.*"

6th.—The Empire, Buckeye Hoosier, Superior and Hagerstown drills were *refused* EITHER AWARD OR REPORT, because of great "irregularities" or "variations" in the tests.

7th.—The variation of our nearest competitior. The Champion, *from its own distribution*, was MORE THAN 237 PER CENT. of that shown by the FARMER'S FAVORITE.

8th.—The award to the FARMER'S FAVORITE, distinguished it by commending it for "ACCURACY OF DELIVERY, AND REGULARITY OF DISCHARGE UNDER DIFFERENT CONDITIONS," and "REGULARITY OF DELIVERY UNDER ALL CONDITIONS." Qualities conspicuously lacking in its competitors.

We challenge contradiction of a single feature of the above statements.

Fully 30 per cent. of all the Fertilizer drills in use on the American Continent are built under our patents,—a fact that largely and undisputably establishes superiority. For circulars, prices of information see our agents, or address **Buckford & Huffman, Macedon, N. Y.**

Wit and Humor.

An Albany clergyman was recently telling a marvelous story, when his little girl said, "Now, pop, say, is that really true, or is it just preaching."—*Exchange.*

An Iowa editor, who was impelled to give up his seat to a lady in a street car, described it as being "crowded out to make room for more interesting matter."

"Anything new or fresh this morning?" a reporter asked in a railroad office.

"Yes," replied the lone occupant of the apartment.

"What is it?" queried the reporter, whipping out his note book.

Said the railroad man, edging toward the door, "That paint you are leaning against."

Such are the loads a newspaper man must bear.

When we Demoralize the Stomach

By excesses or imprudence in eating, we cannot hope to escape the consequences for any great length of time. The most robust digestion must succumb to abuses of that important function. But supposing that we have been foolish enough to enfeeble the stomach, is the damage irreparable? By no means. The dyspeptic has only to do two things to insure his ultimate recovery. First, he should adopt an easily digestible diet. Second, he should use with regularity and persistence Hostetter's Stomach Bitters, the leading gastric invigorant of the age. The multiform symptoms of dyspepsia, and the almost invariably attendant disorders, biliousness and constipation, will assuredly cease to persecute the sufferer if the above advice is attended to. Who that has suffered the torments that chronic indigestion inflicts will neglect to take advantage of a remedy which, if the most positive evidence of the medical profession and the public is to be received with due credence, is an absolute specific for the complaint?

FOR A DAY AT THE FAIR

Constance (adding the last straw). "There, darling! I hope I've forgotten nothing. And oh, Alfred! how much, *much* pleasanter to carry our things ourselves, and be alone together, than to be compelled to ride in the carriage with the old people, and have them listen to all we say!"
